### 3.2.4

## ALPHABETICAL INDEX OF SUBSTANCES AND ARTICLES

#### 3.2.4.1

##### Notes to the Index

This index is an alphabetical list of the substances and articles which are listed in numerical order in the Dangerous Goods List in 3.2.3.

For the purpose of determining the alphabetical order the following information has been ignored even when it forms part of the proper shipping name: numbers; Greek letters; the abbreviations “sec” and “tert”; and the letters “N” (nitrogen), “n” (normal), “o” (ortho) “m” (meta), “p” (para) and “N.O.S.” (not otherwise specified).

The name of a substance or article in block capital letters indicates a proper shipping name.

The name of a substance or article in block capital letters followed by the word “see” indicates an alternative proper shipping name or part of a proper shipping name (except for PCBs).

An entry in lower case letters followed by the word “see” indicates that the entry is not a proper shipping name; it is a synonym.

Where an entry is partly in block capital letters and partly in lower case letters, the latter part is considered not to be part of the proper shipping name.

A proper shipping name may be used in the singular or plural, as appropriate, for the purposes of documentation and package marking.

### **3.2.5 AUSTRALIAN SPECIFIC [AUST.] ENTRIES**

3.2.5.1 The alternative names listed in Column (1) of Table 3.2 may be used in lieu of the proper shipping name, for land transport purposes within Australia, subject to the conditions and limitations detailed in Notes A - G referenced for the particular entry in Column (3).

3.2.5.2 For each of the [AUST.] entries in Column (1) of Table 3.2, reference must be made to the entry in the principle Dangerous Goods List in 3.2.3 for the UN Number shown below in Column (2) to determine classification, packing and tank requirements and the application of any special provisions.

#### **3.2.5.3 DELETED.**

**NOTE:** *[AUST.] entries are not acceptable as proper shipping names on transport documentation or package marking for sea or air transport under IMDG, ICAO or IATA requirements.*

3.2.5.4 Use of UN 1270 Petroleum Fuel [AUST.]

3.2.5.4.1 The use of UN Number 1270 Petroleum Fuel has been discontinued internationally. The continued use in Australia is specifically because of the continued use of tankers carrying mixed loads of petroleum fuels. This is less common elsewhere in the world. This [AUST.] entry is therefore restricted to the UN Number and Proper Shipping Name on Mixed Load (refined petroleum product) Emergency Information Panels in accordance with 5.3.1.3.3, when no single entry (such as UN 1203 or UN 1268) is valid for all compartments of a multi-compartmented portable tank or tank vehicle.

3.2.5.4.2 Where the whole load in a multi-compartmented portable tank or tank vehicle is correctly described by a single UN number other than UN 1270, whether or not that other number is included in Table 3.1, then the use of the Mixed Load (refined petroleum product) Emergency Information Panel is not permitted. For such loads, Emergency Information Panels for the particular substance are required in accordance with 5.3.1.3.1 and Section 5.3.4 (portable tanks) or 5.3.6 (tank vehicles). UN 1270 must not be used to describe such a load.

3.2.5.4.3 Where UN 1270 is displayed on the Emergency Information Panel in accordance with this Section, Section 5.3.4 or 5.3.6, and 5.3.1.3.3, the dangerous goods description on the transport documentation in accordance with 11.1.2.2 must nevertheless show the Proper Shipping Name and UN number for each dangerous substance in the portable tank or tank vehicle.

### 3.2.5.4.4

The refined petroleum products, being dangerous goods of Class 3 and C1 combustible liquids<sup>1</sup>, that may form part of the load of a multi-compartmented portable tank or tank vehicle where UN 1270 is displayed in accordance with 5.3.1.3.3, are listed in Table 3.1.

**Table 3.1: List of Petroleum Based Products**

| UN No. | Proper Shipping Name                                                                                                               |

**Table 3.2: Australian Petroleum Based Products**

---

<sup>1</sup>C1 Combustible Liquids are not classified as dangerous goods for transport purposes. No placarding is required by this Code on a portable tank or tank vehicle transporting only C1 liquid. However, industry practice is often to display "Combustible Liquid" in the area normally used for placarding a tanker.

| [AUST.] Entry                                   | Relevant UN Number Entry in 3.2.3 for Classification, Packing and Tank Requirements |                                                  | Usage – see Notes |

| TOXIC LIQUID, ORGANIC, (CYTOTOXIC DRUG) [AUST.] | 2810                                                                                | TOXIC LIQUID, ORGANIC, N.O.S.                    | G                 |
| TOXIC SOLID, ORGANIC, (CYTOTOXIC DRUG) [AUST.]  | 2811                                                                                | TOXIC SOLID, ORGANIC, N.O.S.                     | G                 |
| WHITE SPIRIT [AUST.]                            | 1300                                                                                | TURPENTINE SUBSTITUTE                            | D                 |

**NOTE:** These uses are valid only for land transport within Australia:

- A. Use permitted as Proper Shipping Name on package marking
- B. Use permitted as Proper Shipping Name on Emergency Information Panels
- C. Use permitted as Proper Shipping Name on transport documentation
- D. Use permitted as Proper Shipping Name for inner packaging marking
- E. For conditions on use of UN 1270, see 3.2.5.4 and 5.3.1.3.3
- F. <DELETED>
- G. These entries must be used for cytotoxic drugs that meet the criteria for packing group I. Despite the assignment of SP 274 to these two UN numbers in the principal Dangerous Goods List, where either of these [AUST.] entries is shown in full as the Proper Shipping Name, it is not necessary to supplement this with the Technical Name on marking or documentation. UN 1851 (liquid) or UN 3249 (solid) must be used for drugs of packing group II or III".

### 3.2.6

### GENERIC AND N.O.S. PROPER SHIPPING NAMES

**NOTE:** This section incorporates, in full, Appendix A of UN23

- 3.2.6.1 Substances or articles not mentioned specifically by name in the Dangerous Goods List in 3.2.3 must be classified in accordance with 3.1.1.2. Thus the name in the Dangerous Goods List which most appropriately describes the substance or article must be used as the Proper Shipping Name. The main generic entries and all the N.O.S. entries given in the Dangerous Goods List are listed below. This proper shipping name must be supplemented by the technical name when special provision 274 has been assigned to the entry in Column 6 of the Dangerous Goods List.
- 3.2.6.2 In this list generic and N.O.S. names are grouped according to their hazard class or division. Within each hazard class or division the names have been placed into three groups as follows:
- (a) specific entries covering a group of substances or articles of a particular chemical or technical nature;
  - (b) pesticide entries, for Class 3 and Division 6.1;
  - (c) general entries covering a group of substances or articles having one or more general dangerous properties.
- 3.2.6.3 When assigning generic and N.O.S. Proper Shipping Names:  
– THE MOST SPECIFIC APPLICABLE NAME MUST ALWAYS BE USED.

**Table 3.3: List of generic and N.O.S proper shipping names**

| Class or Division | Subsidiary Hazard | UN No. | Proper Shipping Name                                |
|-------------------|-------------------|--------|-----------------------------------------------------|
| CLASS 1           |                   |        |                                                     |

## CHAPTER 3.3: SPECIAL PROVISIONS APPLICABLE TO CERTAIN ARTICLES OR SUBSTANCES

### 3.3.1 INTRODUCTION

When Column 6 of the Dangerous Goods List indicates that a special provision is relevant to a substance or article, the meaning and requirements of that special provision are as set forth below. Where a special provision includes a requirement for package marking, the provisions of 5.2.1.2 (a) to (d) shall be met. If the required mark is in the form of specific wording indicated in quotation marks, such as 'LITHIUM BATTERIES FOR DISPOSAL', the size of the mark shall be at least 12 mm, unless otherwise indicated in the special provision or elsewhere in this Code.

### 3.3.2 UN SPECIAL PROVISIONS

The Special Provisions in this Section 3.3.2 are sourced from UN23 and, except as otherwise indicated, are therefore applicable to international transport as well as transport within Australia.

- |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16 | Samples of new or existing explosive substances or articles may be transported as directed by the competent authorities for purposes including: testing, classification, research and development, quality control, or as a commercial sample. Explosive samples which are not wetted or desensitised must be limited to 10 kg in small packages as specified by the competent authorities. Explosive samples which are wetted or desensitised must be limited to 25 kg. |
| 23 | Even though this substance has a flammability hazard, it only exhibits such hazard under extreme fire conditions in confined areas.                                                                                                                                                                                                                                                                                                                                      |
| 26 | This substance is not permitted for transport in portable tanks, or intermediate bulk containers with a capacity exceeding 450 litres, due to potential initiation of explosion when transported in large volumes.                                                                                                                                                                                                                                                       |
| 28 | This substance may be transported under the provisions of Class 3 or Division 4.1 only if it is so packed that the percentage of diluent will not fall below that stated, at any time during transport (see 2.3.1.4 and 2.4.2.4). In cases where the diluent is not stated, the substance shall be packed so that the amount of explosive substance does not exceed the stated value.                                                                                    |
| 29 | This substance is exempt from labelling, but must be marked with the appropriate Class or division.                                                                                                                                                                                                                                                                                                                                                                      |
| 32 | This substance is not subject to this Code when in any other form.                                                                                                                                                                                                                                                                                                                                                                                                       |
| 37 | This substance is not subject to this Code when coated.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 38 | This substance is not subject to this Code when it contains not more than 0.1% calcium carbide.                                                                                                                                                                                                                                                                                                                                                                          |
| 39 | This substance is not subject to this Code when it contains less than 30% or not less than 90% silicon.                                                                                                                                                                                                                                                                                                                                                                  |
| 43 | When offered for carriage as pesticides, these substances must be carried under the                                                                                                                                                                                                                                                                                                                                                                                      |

**SP No.**

- relevant pesticide entry and in accordance with the relevant pesticide provisions (see 2.6.2.3 and 2.6.2.4).
- 45 Antimony sulphides and oxides which contain not more than 0.5% of arsenic calculated on the total mass are not subject to this Code.
- 47 Ferricyanides and ferrocyanides are not subject to this Code.
- 48 The transport of this substance, when it contains more than 20% hydrocyanic acid, is prohibited except with special authorisation granted by the competent authorities.
- 59 These substances are not subject to this Code when they contain not more than 50% magnesium.
- 60 If the concentration is more than 72%, the transport of this substance is prohibited except with special authorisation granted by the competent authorities.
- 61 The technical name which must supplement the proper shipping name must be the ISO common name, other name listed in the WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification or the name of the active substance (see also 3.1.2.8.1.1).
- 62 This substance is not subject to this Code when it contains not more than 4% sodium hydroxide.
- 63 The division of Class 2 and the subsidiary hazards depend on the nature of the contents of the aerosol dispenser. The following provisions must apply:
- (a) Division 2.1 applies if the contents include 85% by mass or more flammable components and the chemical heat of combustion is 30 kJ/g or more;
  - (b) Division 2.2 applies if the contents contain 1% by mass or less flammable components and the heat of combustion is less than 20 kJ/g;
  - (c) Otherwise the product must be classified as tested by the tests described in the Manual of Tests and Criteria, Part III, section 31. Extremely flammable and flammable aerosols must be classified in Division 2.1; non-flammable in Division 2.2;
  - (d) Gases of Division 2.3 must not be used as a propellant in an aerosol dispenser;
  - (e) Where the contents other than the propellant of aerosol dispensers to be ejected are classified as Division 6.1 packing groups II or III or Class 8 packing groups II or III, the aerosol will have a subsidiary hazard of Division 6.1 or Class 8;
  - (f) Aerosols with contents meeting the criteria for packing group I for toxicity or corrosivity are prohibited from transport;
  - (g) Subsidiary hazard labels may be required for air transport.  
Flammable components are flammable liquids, flammable solids or flammable gases and gas mixtures as defined in Notes 1 to 3 of sub-section 31.1.3 of Part III of the Manual of Tests and Criteria. This designation does not cover pyrophoric, self-heating or water-reactive substances. The chemical heat of combustion must be determined by one of the following methods ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 to 86.3 or NFPA 30B.
- 65 Hydrogen peroxide aqueous solutions with less than 8% hydrogen peroxide are not subject to this Code
- 66 Cinnabar is not subject to this Code.
- 103 Ammonium nitrites and mixtures of an inorganic nitrite with an ammonium salt are prohibited.
- 105 Nitrocellulose meeting the descriptions of UN 2556 or UN 2557 may be classified in Division 4.1.

**SP No.**

- 106 Not subject to this Code. Dangerous Goods only when transported by air.
- 113 The carriage of chemically unstable mixtures is prohibited.
- 117 Not subject to this Code. Dangerous Goods only when transported by sea.
- 119 Refrigerating machines include machines or other appliances which have been designed for the specific purpose of keeping food or other items at a low temperature in an internal compartment, and air conditioning units. Refrigerating machines and refrigerating machine components are not subject to this Code if they contain less than 12 kg of gas in Division 2.2 or less than 12 litres ammonia solution (UN 2672).
- 122 The subsidiary hazards, control and emergency temperatures if any, and the generic entry number for each of the currently assigned organic peroxide formulations are given in 2.5.3.2.4, 4.1.4.2 packing instruction IBC520 and 4.2.5.2.6 portable tank instruction T23.
- 123 Not subject to this Code. This entry in the Dangerous Goods List applies only when transported by air or sea.
- 127 Other inert material or inert material mixture may be used at the discretion of the competent authority, provided this inert material has identical phlegmatising properties.
- 131 The phlegmatised substance must be significantly less sensitive than dry PETN.
- 132 During the course of transport, this substance must be protected from direct sunshine and stored (or kept) in a cool and well-ventilated place, away from all sources of heat.
- 133 If over-confined in packagings, this substance may exhibit explosive behaviour. Packagings authorised under packing instruction P409 are intended to prevent over-confinement. When a packaging other than those prescribed under packing instruction P409 is authorised by the competent authority of the country/state of origin in accordance with 4.1.3.7, the package must bear an "EXPLOSIVE" subsidiary hazard label (Model No.1, see 5.2.2.2.2) unless the competent authority of the country/state of origin has permitted this label to be dispensed with for the specific packaging employed because test data have proved that the substance in this packaging does not exhibit explosive behaviour (see 11.1.1.5.5.1). The provisions of 7.1.3.1 of UN23 must also be then considered.
- 135 The dihydrated sodium salt of dichloroisocyanuric acid does not meet the criteria for inclusion in Division 5.1 and is not subject to this Code unless meeting the criteria for inclusion in another Class or Division.
- 138 p-Bromobenzyl cyanide is not subject to this Code.
- 141 Products which have undergone sufficient heat treatment so that they present no hazard during transport are not subject to this Code.
- 142 Solvent extracted soya bean meal containing not more than 1.5% oil and 11% moisture, which is substantially free of flammable solvent, is not subject to this Code.
- 144 An aqueous solution containing not more than 24% alcohol by volume is not subject to this Code.
- 145 Other than for air transport, alcoholic beverages of packing group III, when carried in receptacles of 250 litres or less, are not subject to this Code.
- 146 Other than for air and sea transport, alcoholic beverages of packing group II, when carried in receptacles of 5 litres or less, are not subject to this Code.
- 152 The classification of this substance will vary with particle size and packaging, but borderlines have not been experimentally determined. Appropriate classifications must be made as required by 2.1.3.

**SP No.**

- 153 This entry applies only if it is demonstrated, on the basis of tests, that the substances, when in contact with water are not combustible nor show a tendency to auto-ignition and that the mixture of gases evolved is not flammable.
- 163 A substance specifically listed by name in the Dangerous Goods List of chapter 3.2 must not be transported under this entry. Materials transported under this entry may contain 20% or less nitrocellulose provided the nitrocellulose contains not more than 12.6% nitrogen (by dry mass).
- 168 Asbestos which is immersed or fixed in a natural or artificial binder (such as cement, plastics, asphalt, resins or mineral ore) in such a way that no escape of hazardous quantities of respirable asbestos fibres can occur during transport is not subject to this Code. Manufactured articles containing asbestos and not meeting this provision are nevertheless not subject to this Code when packed so that no escape of hazardous quantities of respirable asbestos fibres can occur during transport.
- 169 Phthalic anhydride in the solid state and tetrahydrophthalic anhydrides, with not more than 0.05% maleic anhydride, are not subject to this Code. Phthalic anhydride molten at a temperature above its flash point, with not more than 0.05% maleic anhydride, must be classified under UN 3256.
- 172 Where a radioactive material has a subsidiary hazard(s):
- (a) The substance must be allocated to Packing Group I, II or III, if appropriate, by application of the packing group criteria provided in Part 2 corresponding to the nature of the predominant subsidiary hazard;
  - (b) Packages must be labelled with subsidiary hazard labels corresponding to each subsidiary hazard exhibited by the material; corresponding placards must be affixed to cargo transport units in accordance with the relevant provisions of 5.3.1;
  - (c) For the purposes of documentation and package marking, the proper shipping name must be supplemented with the name of the constituents which most predominantly contribute to this (these) subsidiary hazard(s) and which must be enclosed in parenthesis;
  - (d) The dangerous goods transport document must indicate the class or division of the subsidiary hazard and, where assigned the packing group as required by 11.1.1.4.1(d) and (e).
- For packing, see also 4.1.9.1.5.
- 177 Barium sulphate is not subject to this Code.
- 178 This designation must be used only when no other appropriate designation exists in the Dangerous Goods List of chapter 3.2, and only with the approval of the competent authority of the country of origin or in accordance with a competent authority determination in accordance with Regulation 1.5.1(1).
- 179 Deleted
- 181 Packages containing this type of substance must bear the "EXPLOSIVE" subsidiary hazard label (Model No. 1, see 5.2.2.2.2) unless the competent authority of the country or state of origin has permitted this label to be dispensed with for the specific packaging employed because test data have proved that the substance in this packaging does not exhibit explosive behaviour (see 11.1.1.5.5.1). The provisions of 7.1.3.1 of UN23 must also be considered.

**SP No.**

182 The group of alkali metals includes lithium, sodium, potassium, rubidium and caesium.  
183 The group of alkaline earth metals includes magnesium, calcium, strontium and barium.

186 Deleted

188 Cells and batteries offered for transport are not subject to other provisions of this Code if they meet the following:

- (a) For a lithium metal or lithium alloy cell, the lithium content is not more than 1 g, and for a lithium ion or sodium ion cell, the Watt-hour rating is not more than 20 Wh;
- (b) For a lithium metal or lithium alloy battery the aggregate lithium content is not more than 2 g, and for a lithium ion or sodium ion battery, the watt-hour rating is not more than 100 Wh. Lithium ion and sodium ion batteries subject to this provision must be marked with the watt-hour rating on the outside case, except lithium ion batteries manufactured before 1 January 2009;
- (c) Each lithium cell or battery meets the provisions of 2.9.4 (a), (e), (f) if applicable and (g) or for sodium ion cells or batteries, the provisions of 2.9.5 (a), (e) and (f) shall apply;
- (d) Cells and batteries, except when installed in equipment, must be packed in inner packagings that completely enclose the cell or battery. Cells and batteries must be protected so as to prevent short circuits. This includes protection against contact with electrically conductive material within the same packaging that could lead to a short circuit. The inner packagings must be packed in strong outer packagings which conform to the provisions of 4.1.1.1, 4.1.1.2, and 4.1.1.5;
- (e) Cells and batteries when installed in equipment must be protected from damage and short circuit, and the equipment must be equipped with an effective means of preventing accidental activation. This requirement does not apply to devices which are intentionally active in transport (radio frequency identification (RFID) transmitters, watches, sensors, etc.) and which are not capable of generating a dangerous evolution of heat. When batteries are installed in equipment, the equipment must be packed in strong outer packagings constructed of suitable material of adequate strength and design in relation to the packaging's capacity and its intended use unless the battery is afforded equivalent protection by the equipment in which it is contained;
- (f) Each package shall be marked with the appropriate lithium or sodium ion battery mark, as illustrated at 5.2.1.9;

**NOTE:** Packages containing lithium batteries packed in conformity with the provisions of Part 4, Chapter 11, packing instructions 965 or 968, Section IB of the ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air that bear the mark as shown in 5.2.1.9 (lithium battery mark) and the label shown in 5.2.2.2.2, Model No.9A shall be deemed to meet the provisions of this special provision.

This requirement does not apply to:

- (i) packages containing only button cell batteries installed in equipment (including circuit boards); and

- (ii) packages containing no more than four cells or two batteries installed in equipment, where there are not more than two packages in the consignment.

When packages are placed in an overpack, the lithium or sodium battery mark shall either be clearly visible or be reproduced on the outside of the overpack and the overpack shall be marked with the word "OVERPACK". The lettering of the "OVERPACK" mark shall be at least 12 mm high.

- (g) Except when cells or batteries are installed in equipment, each package must be capable of withstanding a 1.2 m drop test in any orientation without damage to cells or batteries contained therein, without shifting of the contents so as to allow battery to battery (or cell to cell) contact and without release of contents;
- (h) Except when cells or batteries are installed in or packed with equipment, packages must not exceed 30 kg gross mass.

As used above and elsewhere in this Code, "lithium content" means the mass of lithium in the anode of a lithium metal or lithium alloy cell. As used in this special provision "equipment" means apparatus for which the lithium cells or batteries will provide electrical power for its operation.

Separate entries exist for lithium metal batteries and lithium ion batteries to facilitate the transport of these batteries for specific modes of transport and to enable the application of different emergency response actions.

A single cell battery as defined in Part III, sub-section 38.3.2.3 of the Manual of Tests and Criteria is considered a "cell" and shall be transported according to the requirements for "cells" for the purpose of this special provision.

190 Aerosol dispensers must be provided with protection against inadvertent discharge. Aerosols with a capacity not exceeding 50 ml containing only non-toxic constituents are not subject to this Code.

191 Receptacles, small, containing gas are not fitted with a release device. Receptacles with a capacity not exceeding 50 ml containing only non-toxic constituents are not subject to this Code.

193 This entry may only be used for ammonium nitrate based compound fertilizers. They shall be classified in accordance with the procedure as set out in the Manual of Tests and Criteria, part III, section 39. Fertilizers meeting the criteria for this UN number are not subject to this Code. Dangerous Goods only when transported by air or sea.

194 The control and emergency temperatures, if any, and the generic entry number for each of the currently assigned self-reactive substances are given in 2.4.2.3.2.3.

195 For certain organic peroxides types B or C, a smaller packaging than that allowed by packing methods OP5 or OP6 respectively has to be used (see 4.1.7 and 2.5.3.2.4).

196 Formulations which in laboratory testing neither detonate in the cavitated state nor deflagrate, which show no effect when heated under confinement and which exhibit no explosive power may be transported under this entry. The formulation must also be thermally stable (i.e. the SADT is 60 °C or higher for a 50 kg package). Formulations not meeting these criteria must be transported under the provisions of Division 5.2; see 2.5.3.2.4.

198 Nitrocellulose solutions containing not more than 20% nitrocellulose may be trans-

**SP No.**

- ported as paint, perfumery products or printing ink, as applicable. See UN Nos. 1210, 1263, 1266, 3066, 3469 and 3470.
- 199 Lead compounds which, when mixed in a ratio of 1:1000 with 0.07M hydrochloric acid and stirred for one hour at a temperature of  $23\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ , exhibit a solubility of 5% or less (see ISO 3711:1990 "Lead chromate pigments and lead chromate-molybdate pigments – Specifications and methods of test") are considered insoluble and are not subject to this Code unless they meet the criteria for inclusion in another hazard class or division.
- 201 Lighters and lighter refills must comply with the provisions of the country/state in which they were filled. They must be provided with protection against inadvertent discharge. The liquid portion of the gas must not exceed 85% of the capacity of the receptacle at  $15\text{ }^{\circ}\text{C}$ . The receptacles, including the closures, must be capable of withstanding an internal pressure of twice the pressure of the liquefied petroleum gas at  $55\text{ }^{\circ}\text{C}$ . The valve mechanisms and ignition devices must be securely sealed, taped or otherwise fastened or designed to prevent operation or leakage of the contents during transport. Lighters must not contain more than 10 g of liquefied petroleum gas. Lighter refills must not contain more than 65 g of liquefied petroleum gas.
- 203 This entry must not be used for polychlorinated biphenyls, UN 2315.
- 204 Articles containing smoke producing substance(s) corrosive according to the criteria for Class 8 must be labelled with a "CORROSIVE" subsidiary hazard label (Model No.8, see 5.2.2.2.2).
- Articles containing smoke-producing substance(s) toxic by inhalation according to the criteria for Division 6.1 shall be labelled with a "TOXIC" subsidiary hazard label (Model No 6.1, see 5.2.2.2.2), except that those manufactured before 31 December 2016 may be transported until 1 January 2019 without a "TOXIC" subsidiary hazard label.
- 205 This entry must not be used for UN 3155 PENTACHLOROPHENOL.
- 206 This entry is not intended to include ammonium permanganate, the transport of which is prohibited except with special authorisation granted by the competent authorities.
- 207 Plastics moulding compounds may be made from polystyrene, poly (methyl methacrylate) or other polymeric material.
- 208 The commercial grade of calcium nitrate fertiliser, when consisting mainly of a double salt (calcium nitrate and ammonium nitrate) containing not more than 10% ammonium nitrate and at least 12% water of crystallisation, is not subject to this Code.
- 209 The gas must be at a pressure corresponding to ambient atmospheric pressure at the time the containment system is closed and this must not exceed 105 kPa absolute.
- 210 Toxins from plant, animal or bacterial sources which contain infectious substances, or toxins that are contained in infectious substances, must be classified in Division 6.2.
- 215 This entry only applies to the technically pure substance or to formulations derived from it having an SADT higher than  $75\text{ }^{\circ}\text{C}$  and therefore does not apply to formulations which are self-reactive substances. (For self-reactive substances, see 2.4.2.3.2.3). Homogeneous mixtures containing not more than 35 % by mass of azocarbonamide and at least 65 % of inert substance are not subject to this Code unless criteria of other classes or divisions are met.
- 216 Mixtures of solids which are not subject to this Code and flammable liquids may be transported under this entry without first applying the classification criteria of Division

**SP No.**

- 4.1, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. Each cargo transport unit must be leakproof when used as a bulk packaging. Sealed packets and articles containing less than 10 ml of a packing group II or III flammable liquid absorbed into a solid material are not subject to this Code provided there is no free liquid in the packet or article.
- 217 Mixtures of solids which are not subject to this Code and toxic liquids may be transported under this entry without first applying the classification criteria of Division 6.1, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. Each cargo transport unit must be leakproof when used as a bulk packaging. This entry must not be used for solids containing a packing group I liquid.
- 218 Mixtures of solids which are not subject to this Code and corrosive liquids may be transported under this entry without first applying the classification criteria of Class 8, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. Each cargo transport unit must be leakproof when used as a bulk packaging.
- 219 Genetically modified microorganisms (GMMOs) and genetically modified organisms (GMOs) packed and marked in accordance with packing instruction P904 are not subject to any other requirements in this Code.
- If GMMOs or GMOs meet the definition in chapter 2.6 of a toxic substance or an infectious substance and the criteria for inclusion in Division 6.1 or 6.2 the requirements in this Code for transporting toxic substances or infectious substances apply.
- 220 The technical name of the flammable liquid component only of this solution or mixture must be shown in parentheses immediately following the proper shipping name.
- 221 Substances included under this entry must not be of packing group I.
- 223 If the chemical or physical properties of a substance covered by this description are such that when tested it does not meet the established defining criteria for the Class or division listed in column (3), or any other Class or division, it is not subject to this Code.
- 224 Unless it can be demonstrated by testing that the sensitivity of the substance in its frozen state is no greater than in its liquid state, the substance must remain liquid during normal transport conditions. It must not freeze at temperatures above -15 °C.
- 225 Fire extinguishers under this entry may include installed actuating cartridges (cartridges, power device of Division 1.4C or 1.4S), without changing the classification of Division 2.2 provided the total quantity of deflagrating (propellant) explosives does not exceed 3.2 g per extinguishing unit.
- Fire extinguishers must be manufactured, tested, approved and labelled according to the provisions applied in the country of manufacture.
- NOTE:** “Provisions applied in the country of manufacture” means the provisions applicable in the country of manufacture or those applicable in the country of use.
- Fire extinguishers under this entry include:
- (a) portable fire extinguishers for manual handling and operation;
- NOTE:** This entry applies to portable fire extinguishers, even if some components that are necessary for their proper functioning (e.g. hoses and nozzles) are temporarily detached, as long as the safety of the pressurized extinguishing

*agent containers is not compromised and the fire extinguishers continue to be identified as a portable fire extinguisher.*

- (b) fire extinguishers for installation in aircraft;
- (c) fire extinguishers mounted on wheels for manual handling;
- (d) fire extinguishing equipment or machinery mounted on wheels or wheeled platforms or units transported similar to (small) trailers, and
- (e) fire extinguishers composed of a non-rollable pressure drum and equipment, and handled e.g. by fork lift or crane when loaded or unloaded.

**NOTE:** *Pressure receptacles which contain gases for use in the above-mentioned extinguishers or for use in stationary fire-fighting installations shall meet the requirements in chapter 6.2 and all requirements applicable to the relevant dangerous goods when these pressure receptacles are transported separately.*

- 226 Formulations of these substances containing not less than 30% non-volatile, non-flammable phlegmatizer are not subject to this Code.
- 227 When phlegmatized with water and inorganic inert material the content of urea nitrate may not exceed 75% by mass and the mixture must not be capable of being detonated by the Series 1, type (a), test in the Manual of Tests and Criteria, Part I.
- 228 Mixtures not meeting the criteria for flammable gases (Division 2.1) must be transported under UN 3163.
- 230 Lithium cells and batteries may be transported under this entry if they meet the provisions of 2.9.4. Sodium ion cells and batteries may be transported under this entry if they meet the provisions of 2.9.5.
- 232 This designation may only be used when the substance does not meet the criteria of any other class. Transport in cargo transport units other than in multimodal tanks must be in accordance with standards specified by the competent authorities of the country or state of origin.
- 235 This entry applies to articles which contain Class 1 explosive substances and which may also contain dangerous goods of other classes. These articles are used to enhance safety in vehicles, vessels or aircraft – e.g. air bag inflators, air bag modules, seat-belt pretensioners, and pyromechanical devices.
- 236 Polyester resin kits consist of two components: a base material (either Class 3 or Division 4.1, packing group II or III) and an activator (organic peroxide). The organic peroxide shall be type D, E, or F, not requiring temperature control. The packing group shall be II or III, according to the criteria of either Class 3 or Division 4.1, as appropriate, applied to the base material. The quantity limit shown in column 7a of the Dangerous Goods List of chapter 3.2 applies to the base material.
- 237 The membrane filters, including paper separators, coating or backing materials, etc., that are present in transport, must not be liable to propagate a detonation as tested by one of the tests described in the Manual of Tests and Criteria, Part I, test series 1(a).  
In addition, the competent authority may determine, on the basis of the results of suitable burning rate tests taking account of the standard tests in the Manual of Tests and Criteria, Part III, sub-section 33.2 that nitrocellulose membrane filters in the form in which they are to be transported are not subject to the provisions of this Code applicable to flammable solids in Division 4.1.

**SP No.**

- 238 (a) Batteries can be considered as non-spillable provided that they are capable of withstanding the vibration and pressure differential tests given below, without leakage of battery fluid.
- Vibration test:** The battery is rigidly clamped to the platform of a vibration machine and a simple harmonic motion having an amplitude of 0.8 mm (1.6 mm maximum total excursion) is applied. The frequency is varied at the rate of 1 Hz/min between the limits of 10 Hz and 55 Hz. The entire range of frequencies and return is traversed in  $95 \pm 5$  minutes for each mounting position (direction of vibration) of the battery. The battery is tested in three mutually perpendicular positions (to include testing with fill openings and vents, if any, in an inverted position) for equal time periods.
- Pressure differential test:** Following the vibration test, the battery is stored for six hours at  $24^{\circ}\text{C} \pm 4^{\circ}\text{C}$  while subjected to a pressure differential of at least 88 kPa. The battery is tested in three mutually perpendicular positions (to include testing with fill openings and vents, if any, in an inverted position) for at least six hours in each position.
- NOTE:** *Non-spillable type batteries which are an integral part of and necessary for the operation of mechanical or electronic equipment, must be securely fastened in the battery holder on the equipment and protected in such a manner as to prevent damage and short circuits.*
- (b) Non-spillable batteries are not subject to this Code if, at a temperature of  $55^{\circ}\text{C}$ , the electrolyte will not flow from a ruptured or cracked case and there is no free liquid to flow and if, when packaged for transport, the terminals are protected from short circuit.
- 239 Batteries or cells must not contain dangerous goods other than sodium, sulphur or sodium compounds (e.g. sodium polysulphides and sodium tetrachloroaluminate). Batteries or cells must not be offered for transport at a temperature such that liquid elemental sodium is present in the battery or cell unless exempted and under the conditions established by the competent authority.
- Cells must consist of hermetically sealed metal casings which fully enclose the dangerous goods and which are so constructed and closed as to prevent the release of the dangerous goods under normal conditions of transport.
- Batteries must consist of cells secured within and fully enclosed by a metal casing so constructed and closed as to prevent the release of the dangerous goods under normal conditions of transport.
- 240 *Deleted.*
- 241 The formulation must be prepared so that it remains homogeneous and does not separate during transport. Formulations with low nitrocellulose contents and not showing dangerous properties when tested for their liability to detonate, deflagrate or explode when heated under defined confinement by tests of test series 1 (a), 2 (b) and 2 (c) respectively in the Manual of Tests and Criteria, Part I and not being a flammable solid when tested in accordance with test N.1 in the Manual of Tests and Criteria, Part III, sub-section 33.2.4 (chips, if necessary, crushed and sieved to a particle size of less than 1.25 mm) are not subject to this Code.
- 242 Sulphur is not subject to this Code when it has been formed to a specific shape (e.g.

**SP No.**

- prills, granules, pellets, pastilles or flakes).
- 243 Gasoline, motor spirit and petrol for use in spark-ignition engines (e.g. in automobiles, stationary engines and other engines) must be assigned to this entry regardless of variations in volatility.
- 244 This entry includes e.g. aluminium dross, aluminium skimmings, spent cathodes, spent potliner, and aluminium salt slags.
- Before loading, these by-products shall be cooled to ambient temperature, unless they have been calcined to remove moisture. Cargo transport units containing bulk loads shall be adequately ventilated and protected against ingress of water throughout the journey.
- Notwithstanding the provisions of 4.3.2.2, sheeted bulk containers (BK1) may be used for inland transport.
- 246 This substance must be packed in accordance with packing method OP6 (see applicable packing instruction). During transport, it must be protected from direct sunshine and stored (or kept) in a cool and well-ventilated place, away from all sources of heat.
- 247 Alcoholic beverages containing more than 24% alcohol but not more than 70% by volume, when transported as part of the manufacturing process, may be transported in wooden barrels with a capacity of more than 250 litres and not more than 500 litres meeting the general requirements of 4.1.1, as appropriate, on the following conditions:
- (a) The wooden barrels must be checked and tightened before filling;
  - (b) Sufficient ullage (not less than 3%) must be left to allow for the expansion of the liquid;
  - (c) The wooden barrels must be transported with the bungholes pointing upwards;
  - (d) The wooden barrels must be transported in containers meeting the requirements of the International Convention for Safe Containers (CSC), 1972, as amended. Each wooden barrel must be secured in custom-made cradles and be wedged by appropriate means to prevent it from being displaced in any way during transport.
- 249 Ferrocium, stabilised against corrosion, with a minimum iron content of 10% is not subject to this Code.
- 250 This entry may only be used for samples of chemicals taken for analysis in connection with the implementation of the Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and on their Destruction. The transport of substances under this entry must be in accordance with the chain of custody and security procedures specified by the Organisation for the Prohibition of Chemical Weapons.
- The chemical sample may only be transported providing prior approval has been granted by the competent authority or the Director General of the Organisation for the Prohibition of Chemical Weapons and providing the sample complies with the following provisions:
- (a) It must be packed according to Packing Instruction 623 in the International Civil Aviation Organisation's Technical Instructions for the Safe Transport of Dangerous Goods by Air; and
  - (b) During transport it must be accompanied by a copy of the document of approval for transport, showing the quantity limitations and the packing provisions.

**SP No.**

251 The entry CHEMICAL KIT or FIRST AID KIT is intended to apply to boxes, cases etc. containing small quantities of various dangerous goods which are used for example for medical, analytical or testing or repair purposes.

Such kits shall only contain dangerous goods that are permitted as:

- (a) Excepted quantities not exceeding the quantity indicated by the code in column (7b) of the Dangerous Goods List of chapter 3.2, provided that the net quantity per inner packaging and net quantity per package are as prescribed in 3.5.1.2 and 3.5.1.3; or;
- (b) Limited quantities as indicated in column (7a) of the Dangerous Goods List of chapter 3.2, provided that the net quantity per inner packaging does not exceed 250 ml or 250 g.

Components must not react dangerously (see 4.1.1.6). The total quantity of dangerous goods in any one kit must not exceed either 1 L or 1 kg.

For the purposes of completion of the dangerous goods transport document as set out in 11.1.1.4.1, the packing group shown on the document must be the most stringent packing group assigned to any individual substance in the kit. Where the kit contains only dangerous goods to which no packing group is assigned, no packing group need be indicated on the dangerous goods transport document.

Kits which are carried on board vehicles for first-aid or operating purposes are not subject to this Code

Chemical kits and first aid kits containing dangerous goods in inner packagings which do not exceed the quantity limits applicable to individual substances as specified in column 7a of the Dangerous Goods List of chapter 3.2 may be transported in accordance with chapter 3.4.

- 252
- 1. Ammonium nitrate hot concentrated solutions can be transported under this entry provided:
    - a. The solution contains not more than 93 % ammonium nitrate;
    - b. The solution contains at least 7 % water;
    - c. The solution contains not more than 0.2 % combustible material;
    - d. The solution contains no chlorine compounds in quantities such that the chloride ion level exceeds 0.02 %;
    - e. The pH of an aqueous solution of 10 % of the substance is between 5 and 7, measured at 25°C; and
    - f. The maximum allowable transport temperature of the solution is 140°C.
  - 2. Additionally, ammonium nitrate hot concentrate solutions are not subject to this Code provided:
    - a. The solution contains not more than 80 % ammonium nitrate;
    - b. The solution contains not more than 0.2 % combustible material;
    - c. The ammonium nitrate remains in solution under all conditions of transport; and
    - d. The solution does not meet the criteria of any other class or division.

266 This substance, when containing less alcohol, water or phlegmatiser than specified,

**SP No.**

- must not be transported unless specifically authorised by the competent authority.
- 267 Any explosives, blasting, type C containing chlorates must be segregated from explosives containing ammonium nitrate or other ammonium salts.
- 270 Aqueous solutions of Division 5.1 inorganic solid nitrate substances are considered as not meeting the criteria of Division 5.1 if the concentration of the substances in solution at the minimum temperature encountered in transport is not greater than 80% of the saturation limit.
- 271 Lactose or glucose or similar materials, may be used as a phlegmatiser provided that the substance contains not less than 90%, by mass, of phlegmatiser. The competent authority may authorise these mixtures to be classified in Division 4.1 on the basis of a test series 6(c) of section 16 of part I of the Manual of Tests and Criteria on at least three packages as prepared for transport.
- Mixtures containing at least 98%, by mass, of phlegmatiser are not subject to this Code. Packages containing mixtures with not less than 90%, by mass, of phlegmatiser need not bear a TOXIC subsidiary hazard label.
- 272 This substance must not be transported under the provisions of Division 4.1 unless specifically authorised by the competent authority (see UN 0143 or UN 0150 as appropriate).
- 273 Maneb and maneb preparations stabilised against self-heating need not be classified in Division 4.2 when it can be demonstrated by testing that a cubic volume of 1 m<sup>3</sup> of substance does not self-ignite and that the temperature at the centre of the sample does not exceed 200 °C, when the sample is maintained at a temperature of not less than 75 °C ± 2 °C for a period of 24 hours.
- 274 For the purposes of documentation and package marking, the proper shipping name must be supplemented with the technical name (see 3.1.2.8).
- For UN 3077 and UN 3082 only, the technical name may be a name shown in capital letters in column 2 of the Dangerous Goods List, provided that this name does not include "N.O.S." and that special provision 274 is not assigned. The name which most appropriately describes the substance or mixture shall be used, e.g.:
- UN 3082, ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID, N.O.S.,  
(PAINT)
- UN 3082, ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID, N.O.S.,  
(PERFUMERY PRODUCTS)
- 276 This includes any substance which is not covered by any of the other classes but which has narcotic, noxious or other properties such that, in the event of spillage or leakage on an aircraft, annoyance or discomfort could be caused to crew members so as to prevent the correct performance of assigned duties.
- 277 For aerosols or receptacles containing toxic substances the limited quantity value is 120 ml. For all other aerosols or receptacles the limited quantity value is 1000 ml.
- 278 These substances must not be classified and transported unless authorised by the competent authority on the basis of results from Series 2 tests and a Series 6(c) test of Part I of the Manual of Tests and Criteria on packages as prepared for transport (see 2.1.3.1). The competent authority will assign the packing group on the basis of the chapter 2.3 criteria and the package type used for the Series 6(c) test.
- 279 The substance is assigned to this classification or packing group based on human

**SP No.**

- experience rather than the strict application of classification criteria set out in this Code.
- 280 This entry applies to safety devices for vehicles, vessels or aircraft, e.g. air bag inflators, air bag modules, seat-belt pretensioners, and pyromechanical devices, which contain dangerous goods of Class 1 or of other classes, when transported as component parts and if these articles as presented for transport have been tested in accordance with test series 6(c) of Part 1 of the Manual of Tests and Criteria, with no explosion of the device, no fragmentation of device casing or pressure receptacle, and no projection hazard nor thermal effect which would significantly hinder fire-fighting or emergency response efforts in the immediate vicinity. This entry does not apply to life saving appliances described in special provision 296 (UN Nos. 2990 and 3072) or to fire suppressant dispersing devices (UN Nos. 0514 and 3559).
- 281 The transport by sea of hay, straw or bhusa, wet, damp or contaminated with oil is prohibited. Transport by other modes is also prohibited except with special authorisation by the competent authorities.
- Hay, straw and bhusa, when not wet, damp or contaminated with oil, are not subject to this Code. Dangerous Goods only when transported by sea.
- 283 Articles, containing gas, intended to function as shock absorbers, including impact energy-absorbing devices, or pneumatic springs are not subject to this Code provided:
- (a) each article has a gas space capacity not exceeding 1.6 litres and a charge pressure not exceeding 280 bar where the product of the capacity (litres) and charge pressure (bars) does not exceed 80 (i.e. 0.5 litre gas space and 160 bar charge pressure, 1 litre gas space and 80 bar charge pressure, 1.6 litre gas space and 50 bar charge pressure, 0.28 litre gas space and 280 bar charge pressure);
  - (b) each article has a minimum burst pressure of 4 times the charge pressure at 20°C for products not exceeding 0.5 litre gas space capacity and 5 times charge pressure for products greater than 0.5 litre gas space capacity;
  - (c) each article is manufactured from material which will not fragment upon rupture;
  - (d) each article is manufactured in accordance with a quality assurance standard acceptable to the competent authority; and
  - (e) the design type has been subjected to a fire test demonstrating that pressure in the article is relieved by means of a fire degradable seal or other pressure relief device, such that the article will not fragment and that the article does not rocket.
- 284 An oxygen generator, chemical, containing oxidising substances must meet the following conditions:
- (a) The generator when containing an explosive actuating device must only be transported under this entry when excluded from Class 1 in accordance with 2.1.1.1 (b) of this Code;
  - (b) The generator, without its packaging, must be capable of withstanding a 1.8 m drop test onto a rigid, non-resilient, flat and horizontal surface, in the position most likely to cause damage, without loss of its contents and without actuation; and
  - (c) When a generator is equipped with an actuating device, it must have at least two positive means of preventing unintentional actuation.
- 286 Nitrocellulose membrane filters covered by this entry, each with a mass not exceeding 0.5 g, are not subject to this Code when contained individually in an article or a sealed

**SP No.**

- packet.
- 288 These substances must not be classified and transported unless authorised by the competent authority on the basis of results from Series 2 tests and a Series 6(c) test of the Manual of Tests and Criteria on packages as prepared for transport (see 2.1.3.1).
- 289 Safety devices, electrically initiated and safety devices, pyrotechnic installed in vehicles, vessels or aircraft or in completed components such as steering columns, door panels, seats, etc. are not subject to this Code.
- 290 When this radioactive material meets the definitions and criteria of other classes or divisions as defined in part 2, it must be classified in accordance with the following:
- (a) Where the substance meets the criteria for dangerous goods in excepted quantities as set out in chapter 3.5, the packagings must be in accordance with 3.5.2 and meet the testing requirements of 3.5.3. All other requirements applicable to radioactive material, excepted packages as set out in 1.5.1.5 must apply without reference to the other class or division;
  - (b) Where the quantity exceeds the limits specified in 3.5.1.2 the substance must be classified in accordance with the predominant subsidiary hazard. The dangerous goods transport document must describe the substance with the UN number and proper shipping name applicable to the other class supplemented with the name applicable to the radioactive excepted package according to Column 2 in the Dangerous Goods List of chapter 3.2, and the substance must be transported in accordance with the provisions applicable to that UN number. An example of the information shown on the dangerous goods transport document is:  
  
UN 1993, Flammable liquid, N.O.S. (ethanol and toluene mixture), Radioactive material, excepted package - limited quantity of material, Class 3, PG II.  
  
In addition, the requirements of 2.7.2.4.1 apply.
  - (c) The provisions of chapter 3.4 for the transport of dangerous goods packed in limited quantities must not apply to substances classified in accordance with subparagraph (b).
  - (d) When the substance meets a special provision that exempts this substance from all dangerous goods provisions of the other classes it must be classified in accordance with the applicable UN number of class 7 and all requirements specified in 1.5.1.5 of UN23 apply.
- 291 Flammable liquefied gases must be contained within refrigerating machine components. Components must be designed and tested to at least three times the pressure of the machinery. The refrigerating machines must be designed and constructed to contain the liquefied gas and preclude the risk of bursting or cracking of the pressure retaining components during normal conditions of transport. Refrigerating machines and refrigerating-machine components are considered not subject to this Code if they contain less than 12 kg of gas.
- 292 Deleted
- 293 The following definitions apply to matches:
- (a) Fusee matches are matches the heads of which are prepared with a friction-sensitive igniter composition and a pyrotechnic composition which burns with

**SP No.**

- little or no flame, but with intense heat;
  - (b) Safety matches are matches that combined with or attached to the box, book or card that can be ignited by friction only on a prepared surface;
  - (c) Strike anywhere matches are matches that can be ignited by friction on a solid surface;
  - (d) Wax Vesta matches are matches that can be ignited by friction either on a prepared surface or on a solid surface.
- 294 Safety matches and wax “Vesta” matches in outer packagings not exceeding 25 kg net mass are not subject to any other requirement (except marking) of this Code when packaged in accordance with packing instruction P407.
- 295 Batteries need not be individually marked and labelled if the pallet bears the appropriate mark and label.
- 296 These entries apply for life-saving appliances such as life rafts, personal flotation devices and self-inflating slides. UN 2990 applies for self-inflating appliances and UN 3072 applies for life-saving appliances that are not self-inflating. Life-saving appliances may contain:
- (a) Signal devices (Class 1) which may include smoke and illumination signal flares packed in packagings that prevent them from being inadvertently activated;
  - (b) for UN 2990 only, cartridges, power device of Division 1.4, compatibility group S, may be contained for purposes of the self-inflating mechanism and provided that the quantity of explosives per appliance does not exceed 3.2 g;
  - (c) Division 2.2 compressed or liquefied gases;
  - (d) Electric storage batteries (Class 8) and lithium or sodium ion batteries (Class 9);
  - (e) First aid kits or repair kits containing small quantities of dangerous goods (e.g.: Class 3, Division 4.1, Division 5.2, Class 8 or Class 9 substances); or
  - (f) “Strike anywhere” matches packed in packagings that prevent them from being inadvertently activated.
- Life-saving appliances packed in strong rigid outer packagings with a total maximum gross mass of 40 kg, containing no dangerous goods other than Division 2.2 compressed or liquefied gases with no subsidiary risk in receptacles with a capacity not exceeding 120 ml, installed solely for the purpose of the activation of the appliance, are not subject to this Code.
- 297 Deleted
- 299 Consignments of COTTON, DRY having a density not less than 360 kg/m<sup>3</sup> according to ISO 8115:1986 “Cotton bales- Dimensions and density” are not subject to this Code when transported in closed cargo transport units.
- 300 Fish meal, fish scrap and krill meal must not be transported if the temperature at the time of loading exceeds 35 °C or 5 °C above the ambient temperature whichever is higher.
- 301 This entry only applies to articles such as machinery, apparatus or devices containing dangerous goods as a residue or an integral element of the articles. It must not be used for articles for which a proper shipping name already exists in the Dangerous Goods List. Articles transported under this entry may only contain dangerous goods which are authorised to be transported in accordance with the provisions of chapter 3.4 (Limited quantities). The quantity of dangerous goods in articles must not exceed the quantity specified in Column 7a of the Dangerous Goods List of chapter 3.2 for

**SP No.**

each item of dangerous goods contained. If the articles contain more than one item of dangerous goods, the individual dangerous goods shall be enclosed to prevent them reacting dangerously with one another during transport (see 4.1.1.6). When it is required to ensure liquid dangerous goods remain in their intended orientation, orientation labels must be displayed on at least two opposite vertical sides with the arrows pointing in the correct direction in accordance with 5.2.1.7.1.

The competent authority may exempt from the Code, articles which would otherwise be transported under this entry.

302 Fumigated cargo transport units containing no other dangerous goods are only subject to the provisions of 5.5.2.

303 Receptacles must be assigned to the division and, if any, subsidiary hazard of the gas or mixture of gases contained therein determined in accordance with the provisions of chapter 2.2.

304 This entry may only be used for the transport of non-activated batteries which contain dry potassium hydroxide and which are intended to be activated prior to use by the addition of an appropriate amount of water to the individual cells.

305 These substances are not subject to this Code when in concentrations of not more than 50 mg/kg.

306 This entry may only be used for substances that are too insensitive for acceptance into Class 1 when tested in accordance to test series 2 (see Manual of Tests and Criteria, Part I).

307 This entry may only be used for ammonium nitrate based fertilizers. They shall be classified in accordance with the procedure as set out in the Manual of Tests and Criteria, Part III, Section 39.

308 Stabilization of fishmeal shall be achieved to prevent spontaneous combustion by effective application of ethoxyquin, BHT (butylated hydroxytoluene) or tocopherols (also used in a blend with rosemary extract) at the time of production. The said application shall occur within twelve months prior to shipment. Fish scrap or fish meal shall contain at least 50 ppm (mg/kg) of ethoxyquin, 100 ppm (mg/kg) of BHT or 250 ppm (mg/kg) of tocopherol based antioxidant at the time of consignment.

309 This entry applies to non sensitised emulsions, suspensions and gels consisting primarily of a mixture of ammonium nitrate and fuel, intended to produce a Type E blasting explosive only after further processing prior to use.

The mixture for emulsions typically has the following composition: 60–85% ammonium nitrate; 5–30% water; 2–8% fuel; 0.5–4 % emulsifier agent; 0–10% soluble flame suppressants and trace additives. Other inorganic nitrate salts may replace part of the ammonium nitrate.

The mixture for suspensions and gels typically has the following composition: 60–85% ammonium nitrate, 0–5% sodium or potassium perchlorate, 0–17% hexamine nitrate or monomethylamine nitrate, 5–30% water, 2–15% fuel, 0.5–4% thickening agent, 0–10% soluble flame suppressants, and trace additives. Other inorganic nitrate salts may replace part of the ammonium nitrate.

Substances must satisfy the criteria for classification as an ammonium nitrate emulsion, suspension or gel, intermediate for blasting explosives (ANE) of test series 8 of the Manual of Tests and Criteria, Part I, Section 18 and be approved by the competent

**SP No.**

- authority.
- 310 Cells or batteries from production runs of not more than 100 cells or batteries, or pre-production prototypes of cells or batteries when these prototypes are transported for testing, shall meet the provisions of 2.9.4 with the exception of 2.9.4 (a), (e) (vii), (f) (iii) if applicable, (f) (iv) if applicable and (g).
- NOTE:** "Transported for testing" includes, but is not limited to, testing described in the "Manual of Tests and Criteria", part III, sub-section 38.3, integration testing and product performance testing.
- These cells and batteries shall be packaged in accordance with packing instruction P910 of 4.1.4.1 or LP905 of 4.1.4.3, as applicable.
- Articles (UN Nos. 3537, 3538, 3540, 3541, 3546, 3547 or 3548) may contain such cells or batteries provided that the applicable parts of packing instruction P006 of 4.1.4.1 or LP03 of 4.1.4.3, as applicable, are met.
- The transport document shall include the following statement: "Transport in accordance with special provision 310".
- Damaged or defective cells, batteries, or cells and batteries contained in equipment shall be transported in accordance with special provision 376.
- Cells, batteries or cells and batteries contained in equipment transported for disposal or recycling may be packaged in accordance with special provision 377 and packing instruction P909 of 4.1.4.1.
- 311 Substances must not be transported under this entry unless determined by the competent authority on the basis of the results of appropriate tests according to part I of the Manual of Tests and Criteria. Packaging must ensure that the percentage of diluent does not fall below that stated in the competent authority determination, at any time during transport.
- 312 Deleted
- 313 Deleted
- 314 (a) These substances are liable to exothermic decomposition at elevated temperatures. Decomposition can be initiated by heat or by impurities (e.g. powdered metals (iron, manganese, cobalt, magnesium) and their compounds);  
(b) During the course of transport, these substances must be shaded from direct sunlight and all sources of heat and be placed in adequately ventilated areas.
- 315 This entry must not be used for Division 6.1 substances which meet the inhalation toxicity criteria for packing group I described in 2.6.2.2.4.3.
- 316 This entry applies only to calcium hypochlorite, dry, when transported in non-friable tablet form.
- 317 Fissile-excepted" applies only to those fissile material and packages containing fissile material which are excepted in accordance with 2.7.2.3.5.
- 318 For the purposes of documentation, the proper shipping name must be supplemented with the technical name (see 3.1.2.8). Technical names need not be shown on the package. When the infectious substances to be transported are unknown, but suspected of meeting the criteria for inclusion in category A and assignment to UN 2814 or UN 2900, the words "suspected category A infectious substance" must be shown, in parentheses, following the proper shipping name on the transport document, but not

**SP No.**

- on the outer packagings.
- 319 Substances packed and marked in accordance with packing instruction P650 are not subject to any other requirements in this Code.
- 320 Deleted
- 321 These storage systems must always be considered as containing hydrogen.
- 322 When transported in non-friable tablet form, these goods are assigned to packing group III.
- 323 Deleted
- 324 This substance needs to be stabilised when in concentrations of not more than 99%.
- 325 In the case of non-fissile or fissile excepted uranium hexafluoride, the material must be classified under UN No 2978.
- 326 In the case of fissile uranium hexafluoride, the material must be classified under UN No. 2977.
- 327 Waste aerosols or waste gas cartridges consigned in accordance with 11.1.1.4.3(c) may be transported under UN 1950 or UN 2037, as appropriate, for the purposes of reprocessing or disposal. They need not be protected against movement and inadvertent discharge provided that measures to prevent dangerous build up of pressure and dangerous atmospheres are addressed. Waste aerosols, other than those leaking or severely deformed, shall be packed in accordance with packing instruction P207 and special provision PP87, or packing instruction LP200 and special packing provision L2. Waste gas cartridges, other than those leaking or severely deformed, shall be packed in accordance with packing instruction P003 and special packing provisions PP17 and PP96, or packing instruction LP200 and special packing provision L2. Leaking or severely deformed aerosols and gas cartridges shall be transported in salvage pressure receptacles or salvage packagings provided appropriate measures are taken to ensure there is no dangerous build up of pressure. Waste aerosols and waste gas cartridges shall not be transported in closed freight containers.
- 328 Waste gas cartridges that were filled with gases of Division 2.2 and have been pierced are not subject to the requirements of the Code.
- This entry applies to fuel cell cartridges including when contained in equipment or packed with equipment. Fuel cell cartridges installed in or integral to a fuel cell system are regarded as contained in equipment. Fuel cell cartridge means an article that stores fuel for discharge into the fuel cell through a valve(s) that controls the discharge of fuel into the fuel cell. Fuel cell cartridges, including when contained in equipment, must be designed and constructed to prevent fuel leakage under normal conditions of transport.
- Fuel cell cartridge design types using liquids as fuels must pass an internal pressure test at a pressure of 100 kPa (gauge) without leakage.
- Except for fuel cell cartridges containing hydrogen in metal hydride which must be in compliance with Special Provision 339, each fuel cell cartridge design type must be shown to pass a 1.2 meter drop test onto an unyielding surface in the orientation most likely to result in failure of the containment system with no loss of contents.
- When lithium metal, lithium ion or sodium ion batteries are contained in the fuel cell system, the consignment must be consigned under this entry and under the appropriate entries for UN 3091 LITHIUM METAL BATTERIES CONTAINED IN EQUIPMENT,

**SP No.**

UN 3481 LITHIUM ION BATTERIES CONTAINED IN EQUIPMENT or UN 3552 SODIUM ION BATTERIES CONTAINED IN EQUIPMENT.

329 *Deleted*

330 *Deleted*

331 For environmentally hazardous substances meeting the criteria of 2.9.3, an additional mark as specified in 5.2.1.6 and 5.3.2.3 must be applied, subject to Special Provision AU01 in 3.3.3.

332 Magnesium nitrate hexahydrate is not subject to this Code

333 Ethanol and gasoline, motor spirit or petrol mixtures for use in spark-ignition engines (e.g. in automobiles, stationary engines and other engines) must be assigned to this entry regardless of variations in volatility.

334 A fuel cell cartridge may contain an activator provided it is fitted with two independent means of preventing unintended mixing with the fuel during transport.

335 Mixtures of solids which are not subject to this Code and environmentally hazardous liquids or solids must be classified as UN 3077 and may be transported under this entry, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. Each cargo transport unit must be leakproof when used as a bulk container. If free liquid is visible at the time the mixture is loaded or at the time the packaging or cargo transport unit is closed, the mixture must be classified as UN 3082. Sealed packets and articles containing less than 10 ml of an environmentally hazardous liquid, absorbed into a solid material but with no free liquid in the packet or article, or containing less than 10 g of an environmentally hazardous solid, are not subject to this Code.

(See also SP AU01)

336 A single package of non-combustible solid LSA-II or LSA-III material, if carried by air, must not contain an activity greater than 3000 A<sub>2</sub>.

337 Type B(U) and Type B(M) packages, if transported by air, must not contain activities greater than the following:

- (a) For low dispersible radioactive material: as authorised for the package design as specified in the certificate of approval;
- (b) For special form radioactive material: 3000 A<sub>1</sub> or 100 000 A<sub>2</sub>, whichever is the lower; or
- (c) For all other radioactive material: 3000 A<sub>2</sub>.

338 Each fuel cell cartridge transported under this entry and designed to contain a liquefied flammable gas must:

- (a) Be capable of withstanding, without leakage or bursting, a pressure of at least two times the equilibrium pressure of the contents at 55 °C;
- (b) Not contain more than 200 ml liquefied flammable gas, the vapour pressure of which must not exceed 1 000 kPa at 55 °C; and
- (c) Pass the hot water bath test prescribed in 6.2.4.1.

339 Fuel cell cartridges containing hydrogen in a metal hydride transported under this entry must have a water capacity less than or equal to 120 ml.

The pressure in the fuel cell cartridge must not exceed 5 MPa at 55 °C. The design type must withstand, without leaking or bursting, a pressure of two (2) times the design pressure of the cartridge at 55 °C or 200 kPa more than the design pressure of the cart-

## SP No.

ridge at 55 °C, whichever is greater. The pressure at which this test is conducted is referred to in the Drop Test and the Hydrogen Cycling Test as the “minimum shell burst pressure”.

Fuel cell cartridges must be filled in accordance with procedures provided by the manufacturer. The manufacturer must provide the following information with each fuel cell cartridge:

- (a) Inspection procedures to be carried out before initial filling and before refilling of the fuel cell cartridge;
- (b) Safety precautions and potential hazards to be aware of;
- (c) Method for determining when the rated capacity has been achieved;
- (d) Minimum and maximum pressure range;
- (e) Minimum and maximum temperature range; and
- (f) Any other requirements to be met for initial filling and refilling including the type of equipment to be used for initial filling and refilling.

The fuel cell cartridges must be designed and constructed to prevent fuel leakage under normal conditions of transport. Each cartridge design type, including cartridges integral to a fuel cell, must be subjected to and must pass the following tests:

### Drop test

A 1.8 metre drop test onto an unyielding surface in four different orientations:

- (a) Vertically, on the end containing the shut-off valve assembly;
- (b) Vertically, on the end opposite to the shut-off valve assembly;
- (c) Horizontally, onto a steel apex with a diameter of 38mm, with the steel apex in the upward position; and
- (d) At a 45° angle on the end containing the shut-off valve assembly.

There must be no leakage, determined by using a soap bubble solution or other equivalent means on all possible leak locations, when the cartridge is charged to its rated charging pressure. The fuel cell cartridge must then be hydrostatically pressurised to destruction. The recorded burst pressure must exceed 85% of the minimum shell burst pressure.

### Fire test

A fuel cell cartridge filled to rated capacity with hydrogen must be subjected to a fire engulfment test. The cartridge design, which may include a vent feature integral to it, is deemed to have passed the fire test if:

- (a) The internal pressure vents to zero gauge pressure without rupture of the cartridge; or
- (b) The cartridge withstands the fire for a minimum of 20 minutes without rupture.

### Hydrogen cycling test

This test is intended to ensure that a fuel cell cartridge design stress limits are not exceeded during use.

The fuel cell cartridge must be cycled from not more than 5% rated hydrogen capacity to not less than 95% rated hydrogen capacity and back to not more than 5% rated hydrogen capacity. The rated charging pressure must be used for charging and temperatures must be held within the operating temperature range. The cycling must be

**SP No.**

continued for at least 100 cycles.

Following the cycling test, the fuel cell cartridge must be charged and the water volume displaced by the cartridge must be measured. The cartridge design is deemed to have passed the hydrogen cycling test if the water volume displaced by the cycled cartridge does not exceed the water volume displaced by an uncycled cartridge charged to 95% rated capacity and pressurised to 75% of its minimum shell burst pressure.

**Production leak test**

Each fuel cell cartridge must be tested for leaks at  $15\text{ }^{\circ}\text{C} \pm 5\text{ }^{\circ}\text{C}$ , while pressurised to its rated charging pressure. There must be no leakage, determined by using a soap bubble solution or other equivalent means on all possible leak locations.

Each fuel cell cartridge must be permanently marked with the following information:

- (a) The rated charging pressure in megapascals (MPa);
- (b) The manufacturer's serial number of the fuel cell cartridges or unique identification number; and
- (c) The date of expiry based on the maximum service life (year in four digits; month in two digits).

340 Chemical kits, first aid kits and polyester resin kits containing dangerous substances in inner packagings which do not exceed the quantity limits for excepted quantities applicable to individual substances as specified in column 7b of the Dangerous Goods List of chapter 3.2 may be transported in accordance with chapter 3.5. Division 5.2 substances, although not individually authorized as excepted quantities in the Dangerous Goods List of chapter 3.2, are authorized in such kits and are assigned Code E2 (see 3.5.1.2).

341 Bulk transport of infectious substances in BK1 and BK2 bulk containers is only permitted for infectious substances contained in animal material as defined in 1.2.1 (See 4.3.2.4.1).

342 Glass inner receptacles (such as ampoules or capsules) intended only for use in sterilization devices, when containing less than 30 ml of ethylene oxide per inner packaging with not more than 300 ml per outer packaging, may be transported in accordance with the provisions in chapter 3.5, irrespective of the indication of "E0" in column 7b of the Dangerous Goods List provided that:

- (a) After filling, each glass inner receptacle has been determined to be leak-tight by placing the glass inner receptacle in a hot water bath at a temperature, and for a period of time, sufficient to ensure that an internal pressure equal to the vapour pressure of ethylene oxide at  $55\text{ }^{\circ}\text{C}$  is achieved. Any glass inner receptacle showing evidence of leakage, distortion or other defect under this test shall not be transported under the terms of this special provision;
- (b) In addition to the packaging required by 3.5.2, each glass inner receptacle is placed in a sealed plastics bag compatible with ethylene oxide and capable of containing the contents in the event of breakage or leakage of the glass inner receptacle; and
- (c) Each glass inner receptacle is protected by a means of preventing puncture of the plastics bag (e.g. sleeves or cushioning) in the event of damage to the packaging (e.g. by crushing).

343 This entry applies to crude oil containing hydrogen sulphide in sufficient concentration

**SP No.**

- that vapours evolved from the crude oil can present an inhalation hazard. The packing group assigned must be determined by the flammability hazard and inhalation hazard, in accordance with the degree of danger presented.
- 344 The provisions of 6.2.4 must be met.
- 345 This gas contained in open cryogenic receptacles with a maximum capacity of 1 litre constructed with glass double walls having the space between the inner and outer wall evacuated (vacuum insulated) is not subject to this Code provided each receptacle is transported in an outer packaging with suitable cushioning or absorbent materials to protect it from impact damage.
- 346 Open cryogenic receptacles conforming to the requirements of packing instruction P203 and containing no dangerous goods except for UN 1977, nitrogen, refrigerated liquid, which is fully absorbed in a porous material are not subject to any other requirements of this Code.
- 347 This entry is only permitted to be used if the results of test series 6 (d) of Part I of the Manual of Tests and Criteria have demonstrated that any hazardous effects arising from functioning are confined within the package.
- 348 Lithium batteries manufactured after 31 December 2011 and sodium ion batteries manufactured after 31 December 2025 must be marked with the Watt hour rating on the outside case.
- 349 Mixtures of a hypochlorite with an ammonium salt are not to be accepted for transport. UN 1791 hypochlorite solution is a substance of Class 8.
- 350 Ammonium bromate and its aqueous solutions and mixtures of a bromate with an ammonium salt are not to be accepted for transport.
- 351 Ammonium chlorate and its aqueous solutions and mixtures of a chlorate with an ammonium salt are not to be accepted for transport.
- 352 Ammonium chlorite and its aqueous solutions and mixtures of a chlorite with an ammonium salt are not to be accepted for transport.
- 353 Ammonium permanganate and its aqueous solutions and mixtures of a permanganate with an ammonium salt are not to be accepted for transport.
- 354 This substance is toxic by inhalation.
- 355 Oxygen cylinders for emergency use transported under this entry may include installed actuating cartridges (cartridges, power device of Division 1.4, Compatibility Group C or S), without changing the classification of Division 2.2 provided the total quantity of deflagrating (propellant) explosives does not exceed 3.2 g per oxygen cylinder. The cylinders with the installed actuating cartridges as prepared for transport must have an effective means of preventing inadvertent activation.
- 356 Metal hydride storage systems installed in vehicles, vessels, machinery, engines or aircraft or in completed components or intended to be installed in vehicles, vessels, machinery, engines or aircraft must be approved by the competent authority before acceptance for transport. The transport document must include an indication that the package was approved by the competent authority or a copy of the competent authority approval must accompany each consignment.
- 357 Petroleum crude oil containing hydrogen sulphide in sufficient concentration that vapours evolved from the crude oil can present an inhalation hazard must be consigned under the entry UN 3494 PETROLEUM SOUR CRUDE OIL, FLAMMABLE, TOXIC.

**SP No.**

- 358 Nitroglycerin solution in alcohol with more than 1% but not more than 5% nitroglycerin may be classified in Class 3 and assigned to UN 3064 provided all the requirements of packing instruction P300 are complied with.
- 359 Nitroglycerin solution in alcohol with more than 1% but not more than 5% nitroglycerin is to be classified in Class 1 and assigned to UN 0144 if not all the requirements of packing instruction P300 are complied with.
- 360 Vehicles only powered by lithium metal batteries or lithium ion batteries must be assigned to the entry UN 3556 VEHICLE, LITHIUM ION BATTERY POWERED or UN 3557 VEHICLE, LITHIUM METAL BATTERY POWERED or UN 3558 VEHICLE, SODIUM ION BATTERY POWERED, as applicable. . Lithium batteries installed in cargo transport units, designed only to provide power external to the transport unit shall be assigned to entry UN 3536 LITHIUM BATTERIES INSTALLED IN CARGO TRANSPORT UNIT.
- 361 This entry applies to electric double layer capacitors with an energy storage capacity greater than 0.3 Wh. Capacitors with an energy storage capacity of 0.3 Wh or less are not subject to this Code. Energy storage capacity means the energy held by a capacitor, as calculated using the nominal voltage and capacitance. All capacitors to which this entry applies, including capacitors containing an electrolyte that does not meet the classification criteria of any class or division of dangerous goods, must meet the following conditions:
- (a) Capacitors not installed in equipment must be transported in an uncharged state. Capacitors installed in equipment must be transported either in an uncharged state or protected against short circuit;
  - (b) Each capacitor must be protected against a potential short circuit hazard in transport as follows:
    - (i) When a capacitor's energy storage capacity is less than or equal to 10 Wh or when the energy storage capacity of each capacitor in a module is less than or equal to 10 Wh , the capacitor or module must be protected against short circuit or be fitted with a metal strap connecting the terminals; and
    - (ii) When the energy storage capacity of a capacitor or a capacitor in a module is more than 10 Wh, the capacitor or module must be fitted with a metal strap connecting the terminals;
  - (c) Capacitors containing dangerous goods must be designed to withstand a 95 kPa pressure differential;
  - (d) Capacitors must be designed and constructed to safely relieve pressure that may build-up in use, through a vent or a weak point in the capacitor casing. Any liquid which is released upon venting must be contained by the packaging or by the equipment in which a capacitor is installed; and
  - (e) Capacitors manufactured after 31 December 2013 shall be marked with the energy storage capacity in Wh.

Capacitors containing an electrolyte not meeting the classification criteria of any class or division of dangerous goods, including when installed in equipment, are not subject to other provisions of this Code.

Capacitors containing an electrolyte meeting the classification criteria of any class or division of dangerous goods, with an energy storage capacity of 10 Wh or less are not

subject to other provisions of this Code when they are capable of withstanding a 1.2 metre drop test unpackaged on an unyielding surface without loss of contents.

Capacitors containing an electrolyte meeting the classification criteria of any class or division of dangerous goods that are not installed in equipment and with an energy storage capacity of more than 10 Wh are subject to this Code.

Capacitors installed in equipment and containing an electrolyte meeting the classification criteria of any class or division of dangerous goods, are not subject to other provisions of this Code provided the equipment is packaged in a strong outer packaging constructed of suitable material and of adequate strength and design, in relation to the packaging's intended use and in such a manner as to prevent accidental functioning of capacitors during transport. Large robust equipment containing capacitors may be offered for transport unpackaged or on pallets when capacitors are afforded equivalent protection by the equipment in which they are contained.

**NOTE:** *Capacitors which by design maintain a terminal voltage (e.g. asymmetrical capacitors) do not belong to this entry.*

362

This entry applies to liquids, pastes or powders, pressurised with a propellant which meets the definition of a gas in 2.2.1.1 and 2.2.1.2 (a) or (b).

**NOTE:** *A chemical under pressure in an aerosol dispenser must be transported under UN 1950.*

The following provisions apply:

- (a) The chemical under pressure must be classified based on the hazard characteristics of the components in the different states:
  - The propellant;
  - The liquid; or
  - The Solid

If one of these components, which can be a pure substance or a mixture, needs to be classified as flammable, the chemical under pressure must be classified as flammable in Division 2.1. Flammable components are flammable liquids and liquid mixtures, flammable solids and solid mixtures or flammable gases and gas mixtures meeting the following criteria:

- (i) A flammable liquid is a liquid having a flashpoint of not more than 93 °C;
  - (ii) A flammable solid is a solid which meets the criteria in 2.4.2.2 of this Code;
  - (iii) A flammable gas is a gas which meets the criteria in 2.2.2.1 of this Code;
- (b) Gases of Division 2.3 and gases with a subsidiary hazard of 5.1 must not be used as a propellant in a chemical under pressure;
- (c) Where the liquid or solid components are classified as dangerous goods of Division 6.1, packing groups II or III, or Class 8, packing groups II or III, the chemical under pressure must be assigned a subsidiary hazard of Division 6.1 or Class 8 and the appropriate UN number must be assigned. Components classified in Division 6.1, packing group I, or Class 8, packing group I, must not be used for transport under this proper shipping name;

**SP No.**

- (d) In addition, chemicals under pressure with components meeting the properties of: Class 1, explosives; Class 3, liquid desensitised explosives; Division 4.1, self-reactive substances and solid desensitised explosives; Division 4.2, substances liable to spontaneous combustion; Division 4.3, substances which, in contact with water, emit flammable gases; Division 5.1 oxidising substances; Division 5.2, organic peroxides; Division 6.2, Infectious substances or Class 7, Radioactive material, must not be used for transport under this proper shipping name;
- (e) Substances to which PP86 or TP7 are assigned in Column 9 and Column 11 of the Dangerous Goods List in chapter 3.2 and therefore require air to be eliminated from the vapour space, must not be used for transport under this UN number but must be transported under their respective UN numbers as listed in the Dangerous Goods List of chapter 3.2.

363

This entry may only be used when the conditions of this special provision are met. No other requirements of this Code apply.

- (a) This entry applies to engines or machinery, powered by fuels classified as dangerous goods via internal combustion systems or fuel cells (e.g. combustion engines, generators, compressors, turbines, heating units, etc.), except those which are assigned under UN Nos 3166 or 3363.
- (b) Engines or machinery which are empty of liquid or gaseous fuels and which do not contain other dangerous goods, are not subject to this Code.

**NOTE 1:** *An engine or machinery is considered to be empty of liquid fuel when the liquid fuel tank has been drained and the engine or machinery cannot be operated due to a lack of fuel. Engine or machinery components such as fuel lines, fuel filters and injectors do not need to be cleaned, drained or purged to be considered empty of liquid fuels. In addition, the liquid fuel tank does not need to be cleaned or purged.*

**NOTE 2:** *An engine or machinery is considered to be empty of gaseous fuels when the gaseous fuel tanks are empty of liquid (for liquefied gases), the positive pressure in the tanks does not exceed 2 bar and the fuel shut-off or isolation valve is closed and secured.*

- (c) Engines and machinery containing fuels meeting the classification criteria of Class 3, shall be consigned under the entries UN No. 3528 ENGINE, INTERNAL COMBUSTION, FLAMMABLE LIQUID POWERED or UN No. 3528 ENGINE, FUEL CELL, FLAMMABLE LIQUID POWERED or UN No. 3528 MACHINERY, INTERNAL COMBUSTION, FLAMMABLE LIQUID POWERED or UN No. 3528 MACHINERY, FUEL CELL, FLAMMABLE LIQUID POWERED, as appropriate.
- (d) Engines and machinery containing fuels meeting the classification criteria of Division 2.1, shall be consigned under the entries UN No. 3529 ENGINE, INTERNAL COMBUSTION, FLAMMABLE GAS POWERED or UN No. 3529 ENGINE, FUEL CELL, FLAMMABLE GAS POWERED or UN No. 3529 MACHINERY, INTERNAL COMBUSTION, FLAMMABLE GAS POWERED or UN No. 3529 MACHINERY, FUEL CELL, FLAMMABLE GAS POWERED, as appropriate. Engines and machinery powered by both a flammable gas and a

**SP No.**

flammable liquid shall be consigned under the appropriate UN No. 3529 entry.

- (e) Engines and machinery containing liquid fuels meeting the classification criteria of 2.9.3 for environmentally hazardous substances and not meeting the classification criteria of any other Class or Division, shall be consigned under the entries UN No. 3530 ENGINE, INTERNAL COMBUSTION or UN No. 3530 MACHINERY, INTERNAL COMBUSTION, as appropriate.
- (f) Engines or machinery may contain other dangerous goods than fuels (e.g. batteries, fire extinguishers, compressed gas accumulators or safety devices) required for their functioning or safe operation without being subject to any additional requirements for these other dangerous goods, unless otherwise specified in this Code. However, lithium batteries shall meet the provisions of 2.9.4, except that 2.9.4 (a), (e) (vii), (f) (iii) if applicable, (f) (iv) if applicable and (g) do not apply when batteries of a production run of not more than 100 cells or batteries, or pre-production prototypes of cells or batteries when these prototypes are transported for testing.

Where a lithium battery installed in a machinery or an engine is damaged or defective, the machinery or engine shall be transported as defined by the competent authority.

- (g) The engine or machinery, including the means of containment containing dangerous goods, shall be in compliance with the construction requirements specified by the competent authority;
- (h) Any valves or openings (e.g. venting devices) shall be closed during transport;
- (i) The engines or machinery shall be oriented to prevent inadvertent leakage of dangerous goods and secured by means capable of restraining the engines or machinery to prevent any movement during transport which would change the orientation or cause them to be damaged;
- (j) For UN Nos. 3528 and UN No. 3530:

Where the engine or machinery contains more than 60 l of liquid fuel and has a capacity of not more than 450 l, the labelling requirements of 5.2.2 must apply.

Where the engine or machinery contains more than 60 l of liquid fuel and has a capacity of more than 450 l but not more than 3 000 l, it must be labelled on two opposing sides in accordance with 5.2.2.

Where the engine or machinery contains more than 60 l of liquid fuel and has a capacity of more than 3 000 l, it shall be placarded on two opposing sides. Placards shall correspond to the class indicated in Column 3 of the Dangerous Goods List of chapter 3.2 and shall conform to the specifications given in 5.3.1.2.1;

- (k) For UN 3529:

Where the fuel tank of the engine or machinery has a water capacity of not more than 450 l, the labelling requirements of 5.2.2 shall apply.

Where the fuel tank of the engine or machinery has a water capacity of more than 450 l but not more than 1 000 l, it shall be labelled on two opposing sides in accordance with 5.2.2.

**SP No.**

Where the fuel tank of the engine or machinery has a water capacity of more than 1 000 l, it shall be placarded on two opposing sides. Placards shall correspond to the class indicated in Column 3 of the Dangerous Goods List in chapter 3.2 and shall conform to the specifications given in 5.3.1.2.1;

- (l) A transport document in accordance with 11.1 is required, except for UN No. 3528 and UN No. 3530, where a transport document is only required when the engine or machinery contains more than 60 l of liquid fuels. This transport document shall contain the following additional statement "Transport in accordance with special provision 363";

364 (m) The requirements specified in packing instruction P005 of 4.1.4.1 shall be met. This article may only be transported under the provisions of chapter 3.4 if, as presented for transport, the package is capable of passing the test in accordance with test series 6(d) of part I of the Manual of Tests and Criteria as determined by the competent authority.

365 For manufactured instruments and articles containing mercury or gallium, see UN Nos. 3506 or 3554, as appropriate.

366 For land and sea transport, manufactured instruments and articles containing not more than 1 kg of mercury or gallium are not subject to this Code. For air transport, articles containing not more than 15 g of mercury or gallium are not subject to this Code.

367 For the purposes of documentation and package marking:

The proper shipping name "Paint related material" may be used for consignments of packages containing "Paint" and "Paint related material" in the same package;

The proper shipping name "Paint related material, corrosive, flammable" may be used for consignments of packages containing "Paint, corrosive, flammable" and "Paint related material, corrosive, flammable" in the same package;

The proper shipping name "Paint related material, flammable, corrosive" may be used for consignments of packages containing "Paint, flammable, corrosive" and "Paint related material, flammable, corrosive" in the same package; and

The proper shipping name "Printing ink related material" may be used for consignments of packages containing "Printing Ink" and "Printing ink related material" in the same package.

368 In the case of non-fissile or fissile-excepted uranium hexafluoride, the material must be classified under UN 3507 or UN 2978.

369 In accordance with 2.0.3.2, this radioactive material in an excepted package possessing toxic and corrosive properties is classified in Division 6.1 with radioactivity and corrosivity subsidiary hazards.

Uranium hexafluoride may be classified under this entry only if the conditions of 2.7.2.4.1.2, 2.7.2.4.1.5, 2.7.2.4.5.2 and, for fissile-excepted material, of 2.7.2.3.5 are met.

In addition to the provisions applicable to the transport of Division 6.1 substances with a corrosivity subsidiary hazards, the provisions of 5.1.3.2, 5.1.5.2.2, 5.1.5.4.1(b), 7.1.8.5.1 to 7.1.8.5.4 and 7.1.8.6.1 must apply.

No Class 7 label is required to be displayed.

370 This entry only applies to ammonium nitrate that meets one of the following criteria:

**SP No.**

- (a) ammonium nitrate with more than 0.2% combustible substances, including any organic substance calculated as carbon, to the exclusion of any added substance; or
- (b) ammonium nitrate with not more than 0.2% combustible substances, including any organic substance calculated as carbon, to the exclusion of any added substance, that gives a positive result when tested in accordance with test series 2 (see Manual of Tests and Criteria, Part I). See also UN No. 1942.

This entry shall not be used for ammonium nitrate for which a proper shipping name already exists in the Dangerous Goods List of chapter 3.2 including ammonium nitrate mixed with fuel oil (ANFO) or any of the commercial grades of ammonium nitrate.

371

- (1) This entry also applies to articles, containing a small pressure receptacle with a release device. Such articles must comply with the following requirements:
  - (a) The water capacity of the pressure receptacle must not exceed 0.5 litres and the working pressure must not exceed 25 bar at 15 °C;
  - (b) The minimum burst pressure of the pressure receptacle must be at least four times the pressure of the gas at 15 °C;
  - (c) Each article must be manufactured in such a way that unintentional firing or release is avoided under normal conditions of handling, packing, transport and use. This may be fulfilled by an additional locking device linked to the activator;
  - (d) Each article must be manufactured in such a way as to prevent hazardous projections of the pressure receptacle or parts of the pressure receptacle;
  - (e) Each pressure receptacle must be manufactured from material which will not fragment upon rupture;
  - (f) The design type of the article must be subjected to a fire test. For this test, the provisions of paragraphs 16.6.1.2 except letter g, 16.6.1.3.1 to 16.6.1.3.1.4, 16.6.1.3.6, 16.6.1.3.7 (b) and 16.6.1.3.8 of the Manual of Tests and Criteria must be applied. It must be demonstrated that the article relieves its pressure by means of a fire degradable seal or other pressure relief device, in such a way that the pressure receptacle will not fragment and that the article or fragments of the article do not rocket more than 10 metres;
  - (g) The design type of the article must be subjected to the following test. A stimulating mechanism must be used to initiate one article in the middle of the packaging. There must be no hazardous effects outside the package such as disruption of the package, metal fragments or a receptacle which passes through the packaging.
- (2) The manufacturer must produce technical documentation of the design type, manufacture as well as the tests and their results. The manufacturer must apply procedures to ensure that articles produced in series are made of good quality, conform to the design type and are able to meet the requirements in (1). The manufacturer must provide such information to the Competent Authority on request.

**SP No.**

372 This entry applies to asymmetric capacitors with an energy storage capacity greater than 0.3 Wh. Capacitors with an energy storage capacity of 0.3 Wh or less are not subject to this Code.

Energy storage capacity means the energy stored in a capacitor, as calculated according to the following equation:

$$Wh = \frac{1}{2}C_N(U_R^2 - U_L^2) \times (1/3600),$$

using the nominal capacitance ( $C_N$ ), rated voltage ( $U_R$ ) and rated lower limit voltage ( $U_L$ ).

All asymmetric capacitors to which this entry applies must meet the following conditions:

- (a) Capacitors or modules must be protected against short circuit;
- (b) Capacitors must be designed and constructed to safely relieve pressure that may build-up in use, through a vent or a weak point in the capacitor casing. Any liquid which is released upon venting must be contained by packaging or by equipment in which a capacitor is installed;
- (c) Capacitors manufactured after 31 December 2015, must be marked with the energy storage capacity in Wh;
- (d) Capacitors containing an electrolyte meeting the classification criteria of any class or division of dangerous goods must be designed to withstand a 95 kPa pressure differential;

Capacitors containing an electrolyte not meeting the classification criteria of any class or division of dangerous goods, including when configured in a module or when installed in equipment are not subject to other provisions of this Code.

Capacitors containing an electrolyte meeting the classification criteria of any class or division of dangerous goods, with an energy storage capacity of 20 Wh or less, including when configured in a module, are not subject to other provisions of this Code when the capacitors are capable of withstanding a 1.2 metre drop test unpackaged on an unyielding surface without loss of contents.

Capacitors containing an electrolyte meeting the classification criteria of any class or division of dangerous goods that are not installed in equipment and with an energy storage capacity of more than 20 Wh are subject to this Code.

Capacitors installed in equipment and containing an electrolyte meeting the classification criteria of any class or division of dangerous goods, are not subject to other provisions of this Code provided that the equipment is packaged in a strong outer packaging constructed of suitable material, and of adequate strength and design, in relation to the packaging's intended use and in such a manner as to prevent accidental functioning of capacitors during transport. Large robust equipment containing capacitors may be offered for transport unpackaged or on pallets when capacitors are afforded equivalent protection by the equipment in which they are contained.

**NOTE:** *Notwithstanding the provisions of this special provision, nickel-carbon asymmetric capacitors containing Class 8 alkaline electrolytes must be transported as UN 2795, BATTERIES, WET, FILLED WITH ALKALI, electric storage.*

373 Neutron radiation detectors containing non-pressurized boron trifluoride gas may be

**SP No.**

transported under this entry provided that the following conditions are met.

- (a) Each radiation detector must meet the following conditions:
  - (i) The pressure in each detector must not exceed 105 kPa absolute at 20°C;
  - (ii) The amount of gas must not exceed 13 g per detector;
  - (iii) Each detector must be manufactured under a registered quality assurance programme;  
**NOTE:** *The application of ISO 9001:2008 may be considered acceptable for this purpose.*
  - (iv) Each neutron radiation detector must be of welded metal construction with brazed metal to ceramic feed through assemblies. These detectors must have a minimum burst pressure of 1800 kPa as demonstrated by design type qualification testing; and
  - (v) Each detector must be tested to a  $1 \times 10^{-10}$  cm<sup>3</sup>/s leaktightness standard before filling.
- (b) Radiation detectors transported as individual components must be transported as follows:
  - (i) Detectors must be packed in a sealed intermediate plastics liner with sufficient absorbent or adsorbant material to absorb or adsorb the entire gas contents;
  - (ii) They must be packed in strong outer packaging. The completed package must be capable of withstanding a 1.8 m drop test without leakage of gas contents from detectors;
  - (iii) The total amount of gas from all detectors per outer packaging must not exceed 52 g.
- (c) Completed neutron radiation detection systems containing detectors meeting the conditions of paragraph (a) must be transported as follows:
  - (i) The detectors must be contained in a strong sealed outer casing;
  - (ii) The casing must contain sufficient absorbent material to absorb the entire gas contents;
  - (iii) The completed systems must be packed in strong outer packagings capable of withstanding a 1.8 m drop test without leakage unless a system's outer casing affords equivalent protection.

Packing instruction P200 of 4.1.4.1 is not applicable.

The transport document must include the following statement "Transport in accordance with special provision 373".

Neutron radiation detectors containing not more than 1 g of boron trifluoride, including those with solder glass joints, are not subject to this Code provided they meet the requirements in paragraph (a) and are packed in accordance with paragraph (b). Radiation detection systems containing such detectors are not subject to this Code provided they are packed in accordance with paragraph (c).

374 This entry may only be used, as authorised by the competent authority, for pack-

**SP No.**

agings, large packagings or intermediate bulk containers (IBC), or parts thereof, which have contained dangerous goods, other than radioactive material, which are transported for disposal, recycling or recovery of their material, other than reconditioning, repair, routine maintenance, remanufacturing or reuse, and which have been emptied to the extent that only residues of dangerous goods adhering to the packaging parts are present when they are handed over for transport.

375 These substances when transported in single or combination packagings containing a net quantity per single or inner packaging of 5 l or less for liquids or having a net mass per single or inner packaging of 5 kg or less for solids, are not subject to any other provisions of this Code provided the packagings meet the general provisions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8.

376 Lithium ion, lithium metal or sodium ion cells or batteries identified as being damaged or defective such that they do not conform to the type tested according to the applicable provisions of the Manual of Tests and Criteria must comply with the requirements of this special provision.

For the purposes of this special provision, these may include, but are not limited to:

- Cells or batteries identified as being defective for safety reasons;
- Cells or batteries that have leaked or vented;
- Cells or batteries that cannot be diagnosed prior to transport; or
- Cells or batteries that have sustained physical or mechanical damage.

**NOTE:** *In assessing a cell or battery as damaged or defective, an assessment or evaluation must be performed based on safety criteria from the cell, battery or product manufacturer or by a technical expert with knowledge of the cell's or battery's safety features. An assessment or evaluation may include, but is not limited to, the following criteria:*

- (a) *Acute hazard, such as gas, fire, or electrolyte leaking;*
- (b) *The use or misuse of the cell or battery;*
- (c) *Signs of physical damage, such as deformation to cell or battery casing, or colours on the casing;*
- (d) *External and internal short circuit protection, such as voltage or isolation measures;*
- (e) *The condition of the cell or battery safety features; or*
- (f) *Damage to any internal safety components, such as the battery management system.*

Cells and batteries must be transported according to the provisions applicable to UN Nos.3090, 3091, 3480, 3481, 3551 and 23352, as appropriate, except special provision 230 and as otherwise stated in this special provision.

Cells and batteries must be packed in accordance with packing instructions P908 of 4.1.4.1 or LP904 of 4.1.4.3, as applicable.

Cells and batteries identified as damaged or defective and liable to rapidly disassemble, dangerously react, produce a flame or a dangerous evolution of heat or a dangerous emission of toxic, corrosive or flammable gases or vapours under normal conditions of transport shall be packed and transported in accordance with packing instruction P911 of 4.1.4.1 or LP906 of 4.1.4.3, as applicable. Alternative packing and/or transport conditions may be authorized by the competent authority.

**SP No.**

Packages shall be marked "DAMAGED/DEFECTIVE" in addition to the proper shipping name, as stated in 5.2.1.

The transport document shall include the following statement "Transport in accordance with special provision 376".

- 377 Lithium ion and lithium metal or sodium ion cells and batteries and equipment containing such cells and batteries transported for disposal or recycling, either packed together with or packed without non-lithium or non-sodium batteries, may be packaged in accordance with packing instruction P909 of 4.1.4.1.

These cells and batteries are not subject to the requirements of section 2.9.4. Additional exemptions may be provided under the conditions defined by modal transport regulations.

Packages must be marked "LITHIUM BATTERIES FOR DISPOSAL", "SODIUM ION BATTERIES FOR DISPOSAL", "LITHIUM BATTERIES FOR RECYCLING" or "SODIUM ION BATTERIES FOR RECYCLING", as appropriate.

Identified damaged or defective batteries must be transported in accordance with special provision 376.

- 378 Radiation detectors containing this gas in non-refillable pressure receptacles not meeting the requirements of chapter 6.2 and packing instruction P200 of 4.1.4.1 may be transported under this entry provided:

- (a) The working pressure in each receptacle does not exceed 50 bar;
- (b) The receptacle capacity does not exceed 12 litres;
- (c) Each receptacle has a minimum burst pressure of at least 3 times the working pressure when a relief device is fitted and at least 4 times the working pressure when no relief device is fitted;
- (d) Each receptacle is manufactured from material which will not fragment upon rupture;
- (e) Each detector is manufactured under a registered quality assurance programme;

**NOTE:** ISO 9001:2008 may be used for this purpose.

- (f) Detectors are transported in strong outer packagings. The complete package shall be capable of withstanding a 1.2 metre drop test without breakage of the detector or rupture of the outer packaging. Equipment that includes a detector shall be packed in a strong outer packaging unless the detector is afforded equivalent protection by the equipment in which it is contained; and
- (g) The transport document includes the following statement "Transport in accordance with special provision 378". Radiation detectors, including detectors in radiation detection systems, are not subject to any other requirements of this Code if the detectors meet the requirements in (a) to (f) above and the capacity of detector receptacles does not exceed 50 ml.

- 379 Anhydrous ammonia adsorbed or absorbed on a solid contained in ammonia dispensing systems or receptacles intended to form part of such systems are not subject to the other provisions of this Code if the following conditions are observed:

- (a) The adsorption or absorption presents the following properties:
  - (i) The pressure at a temperature of 20 °C in the receptacle is less than 0.6

**SP No.**

- bar;
- (ii) The pressure at a temperature of 35 °C in the receptacle is less than 1 bar;
- (iii) The pressure at a temperature of 85 °C in the receptacle is less than 12 bar.
- (b) The adsorbent or absorbent material shall not have dangerous properties listed in Classes 1 to 8;
- (c) The maximum contents of a receptacle shall be 10 kg of ammonia; and
- (d) Receptacles containing adsorbed or absorbed ammonia must meet the following conditions:
  - (i) Receptacles shall be made of a material compatible with ammonia as specified in ISO 11114-1:2020;
  - (ii) Receptacles and their means of closure must be hermetically sealed and able to contain the generated ammonia;
  - (iii) Each receptacle must be able to withstand the pressure generated at 85 °C with a volumetric expansion no greater than 0.1%;
  - (iv) Each receptacle shall be fitted with a device that allows for gas evacuation once pressure exceeds 15 bar without violent rupture, explosion or projection; and
  - (v) Each receptacle must be able to withstand a pressure of 20 bar without leakage when the pressure relief device is deactivated. When transported in an ammonia dispenser, the receptacles must be connected to the dispenser in such a way that the assembly is guaranteed to have the same strength as a single receptacle. The properties of mechanical strength mentioned in this special provision must be tested using a prototype of a receptacle and/or dispenser filled to nominal capacity, by increasing the temperature until the specified pressures are reached. The test results must be documented, must be traceable and must be communicated to the relevant authorities upon request.

380 *Deleted*

381 Large packagings conforming to the packing group III performance level used in accordance with packing instruction LP02 of 4.1.4.3, as prescribed in the 18th revised edition of the United Nations Recommendations on the Transport of Dangerous Goods, Model Regulations, may be used until 31 December 2022.

382 Polymeric beads may be made from polystyrene, poly (methyl methacrylate) or other polymeric material. When it can be demonstrated that no flammable vapour, resulting in a flammable atmosphere, is evolved according to test U1 (Test method for substances liable to evolve flammable vapours) of part III, sub-section 38.4.4 of the Manual of Tests and Criteria, polymeric beads, expandable need not be classified under this UN number. This test should only be performed when de-classification of a substance is considered.

383 Table tennis balls manufactured from celluloid are not subject to this Code where the net mass of each table tennis ball does not exceed 3.0 g and the total net mass of table tennis balls does not exceed 500 g per package.

**SP No.**

- 384 The label to be used is Model No 9A, see 5.2.2.2.2. However, for placarding of cargo transport units, the placard shall correspond to Model No 9.
- 385 Deleted
- 386 When substances are stabilized by temperature control, the provisions of 7.1.5 apply. When chemical stabilization is employed, the person offering the packaging, IBC or tank for transport must ensure that the level of stabilization is sufficient to prevent the substance in the packaging, IBC or tank from dangerous polymerization at a bulk mean temperature of 50 °C, or, in the case of a portable tank, 45 °C. Where chemical stabilization becomes ineffective at lower temperatures within the anticipated duration of transport, temperature control is required. In making this determination factors to be taken into consideration include, but are not limited to, the capacity and geometry of the packaging, IBC or tank and the effect of any insulation present, the temperature of the substance when offered for transport, the duration of the journey and the ambient temperature conditions typically encountered in the journey (considering also the season of year), the effectiveness and other properties of the stabilizer employed, applicable operational controls imposed by regulation (e.g. requirements to protect from sources of heat, including other cargo transported at a temperature above ambient) and any other relevant factors.
- 387 Lithium batteries in conformity with 2.9.4 (f) containing both primary lithium metal cells and rechargeable lithium ion cells shall be assigned to UN Nos. 3090 or 3091 as appropriate. When such batteries are transported in accordance with special provision 188, the total lithium content of all lithium metal cells contained in the battery shall not exceed 1.5 g and the total capacity of all lithium ion cells contained in the battery shall not exceed 10 Wh.
- 388 UN 3166 entries apply to vehicles powered by flammable liquid or gas internal combustion engines or fuel cells.
- Vehicles powered by a fuel cell engine shall be assigned to the entries UN 3166 VEHICLE, FUEL CELL, FLAMMABLE GAS POWERED or UN 3166 VEHICLE, FUEL CELL, FLAMMABLE LIQUID POWERED, as appropriate. These entries include hybrid electric vehicles powered by both a fuel cell and an internal combustion engine with wet batteries, sodium batteries, lithium metal batteries or lithium ion batteries, transported with the battery(ies) installed.
- Other vehicles which contain an internal combustion engine shall be consigned under the entries UN 3166 VEHICLE, FLAMMABLE GAS POWERED or UN 3166 VEHICLE, FLAMMABLE LIQUID POWERED, as appropriate. These entries include hybrid electric vehicles powered by both an internal combustion engine and wet batteries, sodium batteries, lithium metal batteries or lithium ion batteries, transported with the battery (ies) installed.
- If a vehicle is powered by a flammable liquid and a flammable gas internal combustion engine, it shall be assigned to UN 3166 VEHICLE, FLAMMABLE GAS POWERED
- Entry UN 3171 only applies to vehicles and equipment powered by wet batteries, metallic sodium batteries or sodium alloy batteries, with these batteries installed.
- UN 3556 VEHICLE, LITHIUM ION BATTERY POWERED, UN 3557 VEHICLE, LITHIUM METAL BATTERY POWERED and UN 3558 VEHICLE, SODIUM ION BATTERY POWERED, as applicable, apply to vehicles powered by lithium ion, lithium

metal or sodium ion batteries transported with the batteries installed.

For the purpose of this special provision, vehicles are self-propelled apparatus designed to carry one or more persons or goods. Examples of such vehicles are cars, motorcycles, scooters, three- and four-wheeled vehicles or motorcycles, trucks, locomotives, bicycles (pedal cycles with a motor) and other vehicles of this type (e.g. self-balancing vehicles or vehicles not equipped with at least one seating position), wheel-chairs, lawn tractors, self-propelled farming and construction equipment, boats and aircraft. When vehicles are transported in a packaging, some parts of the vehicle, other than the battery, may be detached from its frame to fit into the packaging.

Examples of equipment are lawnmowers, cleaning machines or model boats and model aircraft. Equipment powered by lithium metal batteries or lithium ion batteries shall be consigned under the entries UN 3091 LITHIUM METAL BATTERIES CONTAINED IN EQUIPMENT or UN 3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT or UN 3481 LITHIUM ION BATTERIES CONTAINED IN EQUIPMENT or UN 3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT, as appropriate. Lithium ion batteries or lithium metal batteries installed in a cargo transport unit and designed only to provide power external to the cargo transport unit shall be assigned to the entry UN 3536 LITHIUM BATTERIES INSTALLED IN CARGO TRANSPORT UNIT lithium ion batteries or lithium metal batteries.

Dangerous goods, such as batteries, airbags, fire extinguishers, compressed gas accumulators, safety devices and other integral components of the vehicle that are necessary for the operation of the vehicle or for the safety of its operator or passengers, shall be securely installed in the vehicle and are not otherwise subject to this Code.

However, lithium batteries shall meet the provisions of 2.9.4, except that 2.9.4 (a) does not apply when pre-production prototype batteries or batteries of a small production run, consisting of not more than 100 batteries, are installed in vehicles or equipment.

Where a lithium battery installed in a vehicle or equipment is damaged or defective, the vehicle or equipment shall be transported as defined by the competent authority.

389 This entry only applies to lithium ion batteries or lithium metal batteries installed in a cargo transport unit and designed only to provide power external to the cargo transport unit. The lithium batteries shall meet the requirements of 2.9.4 (a) to (g) and contain the necessary systems to prevent overcharge and over discharge between the batteries.

The batteries shall be securely attached to the interior structure of the cargo transport unit (e.g., by means of placement in racks, cabinets, etc.) in such a manner as to prevent short circuits, accidental operation, and significant movement relative to the cargo transport unit under the shocks, loadings and vibrations normally incident to transport. Dangerous goods necessary for the safe and proper operation of the cargo transport unit (e.g., fire extinguishing systems and air conditioning systems), shall be properly secured to or installed in the cargo transport unit and are not otherwise subject to this Code. Dangerous goods not necessary for the safe and proper operation of the cargo transport unit shall not be transported within the cargo transport unit.

The batteries inside the cargo transport unit are not subject to marking or labelling requirements. The cargo transport unit shall display the UN number in accordance with 5.3.2.1.2 and be placarded on two opposing sides in accordance with 5.3.1.1.2.

- 390 When a package contains a combination of lithium batteries contained in equipment and lithium batteries packed with equipment, the following requirements apply for the purposes of package marking and documentation:
- (a) the package must be marked “UN 3091 Lithium metal batteries packed with equipment”, or “UN 3481 Lithium ion batteries packed with equipment”, as appropriate. If a package contains both lithium ion batteries and lithium metal batteries packed with and contained in equipment, the package must be marked as required for both battery types. However, button cell batteries installed in equipment (including circuit boards) need not be considered.
  - (b) the transport document must indicate “UN 3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT” or “UN 3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT”, as appropriate. If a package contains both lithium metal batteries and lithium ion batteries packed with and contained in equipment, then the transport document must indicate both “UN 3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT” and “UN 3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT”.
- 391 Articles containing dangerous goods of Division 2.3, or Division 4.2, or Division 4.3, or Division 5.1, or Division 5.2 or Division 6.1 for substances of inhalation toxicity requiring Packing Group I and articles containing more than one of the hazards listed in 2.0.3.1 (b), (c), or (d) shall be transported under conditions approved by the competent authority.
- 392 For the transport of fuel gas containment systems designed and approved to be fitted in motor vehicles containing this gas the provisions of sub-section 4.1.4.1 and chapter 6.2 of these Regulations need not be applied when transported for disposal, recycling, repair, inspection, maintenance or from where they are manufactured to a vehicle assembly plant, provided the following conditions are met:
- (a) The fuel gas containment systems shall meet the requirements of the standards or regulations for fuel tanks for vehicles, as applicable. Examples of applicable standards and regulations are:

| <b>LP Gas, Natural Gas (CNG &amp; LNG) &amp; Hydrogen</b>                                                                                                                             |                                                                                                                                 |

| ECE Regulation No. 134          | Uniform provisions concerning the approval of motor vehicles and their components with regards to the safety-related performance of hydrogen and fuel cell vehicles (HFCV)                         |
| CSA B51 Part 2:<br>2014         | Boiler, pressure vessel, and pressure piping code part 2<br>Requirements for high-pressure cylinders for on-board storage of fuels for automotive vehicles                                         |

Gas tanks designed and constructed in accordance with previous versions of relevant standards or regulations for gas tanks for motor vehicles, which were applicable at the time of the certification of the vehicles for which the gas tanks were designed and constructed may continue to be transported;

- (b) The fuel gas containment systems shall be leakproof and shall not exhibit any signs of external damage which may affect their safety;

**NOTE 1:** *Criteria may be found in standard ISO 11623:2015 Gas cylinders – Composite construction – Periodic inspection and testing (or ISO 19078:2013 Gas cylinders – Inspection of the cylinder installation, and requalification of high pressure cylinders for the on-board storage of natural gas as a fuel for automotive vehicles);*

**NOTE 2:** *If the fuel gas containment systems are not leakproof or are overfilled or if they exhibit damage that could affect their safety (e.g. in case of a safety related recall), they must only be carried in salvage pressure receptacles in conformity with this Code.*

- (c) If a fuel gas containment system is equipped with two valves or more integrated in line, the two valves shall be closed as to be gastight under normal conditions of transport. If only one valve exists or only one valve works, all openings with the exception of the opening of the pressure relief device shall be closed as to be gastight under normal conditions of transport;
- (d) Fuel gas containment systems shall be transported in such a way as to prevent obstruction of the pressure relief device or any damage to the valves and any other pressurised part of the fuel gas containment systems and unintentional release of the gas under normal conditions of transport. The fuel gas containment system shall be secured in order to prevent slipping, rolling or vertical movement;

**SP No.**

- (e) Valves shall be protected by one of the methods described in 4.1.6.1.8 (a) to (e);
- (f) Except for the case of fuel gas containment systems removed for disposal, recycling, repair, inspection or maintenance, they shall be filled with not more than 20 % of their nominal filling ratio or nominal working pressure, as applicable;
- (g) Notwithstanding the provisions of chapter 5.2, when fuel gas containment systems are consigned in a handling device, markings and labels may be affixed to the handling device; and
- (h) Notwithstanding the provisions of 5.4.1.5 the information on the total quantity of dangerous goods may be replaced by the following information:
  - (i) The number of fuel gas containment systems; and
  - (ii) In the case of liquefied gases the total net mass (kg) of gas of each fuel gas containment system and, in the case of compressed gases, the total water capacity (l) of each fuel gas containment system followed by the nominal working pressure.

Examples for information in the transport document:

Example 1: "UN 1971 natural gas, compressed, 2.1, 1 fuel gas containment system of 50 l in total, 200 bar".

Example 2: "UN 1965 hydrocarbon gas mixture, liquefied, n.o.s., 2.1, 3 fuel gas containment systems, each of 15 kg net mass of gas".

393 The nitrocellulose must meet the criteria of the Bergmann-Junk test or methyl violet paper test in the Manual of Tests and Criteria appendix 10. Tests of type 3 (c) need not be applied.

394 The nitrocellulose must meet the criteria of the Bergmann-Junk test or methyl violet paper test in the Manual of Tests and Criteria appendix 10.

395 This entry shall only be used for solid medical waste of Category A transported for disposal.

396 Large and robust articles may be transported with connected gas cylinders with the valves open regardless of 4.1.6.1.5 provided:

- (a) The gas cylinders contain nitrogen of UN 1066 or compressed gas of UN 1956 or compressed air of UN 1002;
- (b) The gas cylinders are connected with the article through pressure regulators and fixed piping in such a way that the pressure of the gas (gauge pressure) in the article does not exceed 35 kPa (0.35 bar)
- (c) The gas cylinders are properly secured so that they cannot move in relation to the article and are fitted with strong and pressure resistant hoses and pipes;
- (d) The gas cylinders, pressure regulators, piping and other components are protected from damage and impacts during transport by wooden crates or other suitable means;
- (e) The transport document includes the following statement "Transport in accordance with special provision 396";
- (f) Cargo transport units containing articles transported with cylinders with open valves containing a gas presenting a risk of asphyxiation are well ventilated and

**SP No.**

- are marked in accordance with 5.5.3.6.
- 397 Mixtures of nitrogen and oxygen containing not less than 19.5 % and not more than 23.5 % oxygen by volume may be transported under this entry when no other oxidizing gases are present. A Division 5.1 subsidiary hazard label is not required for concentrations within this limit.
- 398 This entry applies to mixtures of butylenes, 1-butylene, cis-2-butylene and trans-2-butylene. For isobutylene, see UN 1055.
- 399 For articles that meet the definition for DETONATORS, ELECTRONIC as described in appendix B and assigned to UN Nos. 0511, 0512 and 0513, the entries for DETONATORS, ELECTRIC (UN Nos. 0030, 0255 and 0456) may continue to be used until 30 June 2025.
- 400 Sodium ion cells and batteries and sodium ion cells and batteries in or packed with equipment, prepared and offered for transport, are not subject to other provisions of this Code if they meet the following:
- (a) The cell or battery is short-circuited, in a way that the cell or battery does not contain electrical energy. The short-circuiting of the cell or battery shall be easily verifiable (e.g. busbar between terminals);
  - (b) Each cell or battery meets the provisions of 2.9.5 (a), (b), (d), (e) and (f);
  - (c) Each package shall be marked according to 5.2.1.9;
  - (d) Except when cells or batteries are installed in equipment, each package shall be capable of withstanding a 1.2 m drop test in any orientation without damage to cells or batteries contained therein, without shifting of the contents so as to allow battery to battery (or cell to cell) contact and without release of contents;
  - (e) Cells and batteries, when installed in equipment shall be protected from damage. When batteries are installed in equipment, the equipment shall be packed in strong outer packagings constructed of suitable material of adequate strength and design in relation to the packaging's capacity and its intended use unless the battery is afforded equivalent protection by the equipment in which it is contained;
  - (f) Each cell, including when it is a component of a battery, shall only contain dangerous goods that are authorised to be transported in accordance with the provisions of chapter 3.4 and in a quantity not exceeding the quantity specified in column 7a of the Dangerous Goods List of chapter 3.2.
- 401 Sodium ion cells and batteries with organic electrolyte shall be transported as UN Nos. 3551 or 3552, as appropriate. Sodium ion cells and batteries with aqueous alkali electrolyte shall be transported as UN 2795 BATTERIES, WET, FILLED WITH ALKALI, electric storage.
- 402 Substances transported under this entry shall have a vapour pressure at 70° C not exceeding 1.1MPa (11 bar) and a density at 50 °C not lower than 0.525 kg/L.
- 403 Nitrocellulose (NC) membrane filters covered by this entry with NC content not exceeding 53 g/m<sup>2</sup> and a NC net weight not exceeding 300 g per inner packaging, are not subject to the requirements of this regulation if they meet the following conditions:
- (a) They are packed with paper separators of minimum 80 g/m<sup>2</sup> placed between each layer of NC membrane filters;

**SP No.**

- (b) They are packed to maintain the alignment of the NC membrane filters and the paper separators in any of the following configurations:
  - (i) Rolls tightly wound and packed in plastic foil of minimum 80 g/m<sup>2</sup> or aluminium pouches with an oxygen permeability of equal or less than 0.1% according to standard ISO 15105-1:2007;
  - (ii) Sheets packed in cardboard of min. 250 g/m<sup>2</sup> or aluminium pouches with an oxygen permeability of equal or less than 0.1% according to standard ISO 15105-1:2007;
  - (iii) Round filters packed in disc holderes or cardboard packaging of minimum 250 g/m<sup>2</sup> or single packed in pouches of paper and plastic material of total minimum 100 g/m<sup>2</sup>.

404 Vehicles powered by sodium ion batteries, containing no other dangerous goods, are not subject to other provisions of this Code, if the battery is short-circuited, in a way that the battery does not contain electric energy. The short-circuiting of the battery shall be easily verifiable (e.g. busbar between terminals).

405 Vehicles are not subject to the marking or labelling requirements of chapter 5.2 when they are not fully enclosed by packagings, crates or other means that prevent ready identification, as UN 3556, UN 3557 or UN 3558.

Vehicles are subject to the requirments of special provision 388, but are not subject to the other provisions of this Code.

406 This entry may be transported in accordance with the limited quantity provisions of chapter 3.4 when transported in pressure receptacles containing not more than 1000 ml. The pressure receptacles shall meet the requirements of packing instruction P200 of 4.1.4.1 and have a test pressure capacity product not exceeding 15.2 MPa·l (152 bar·l). The pressure receptacles shall not be packed together with other dangerous goods.

407 Fire suppressant dispersing devices are articles which contain a pyrotechnic substance, which are intended to disperse a fire extinguishing agent (or aerosol) when activated, and which do not contain any other dangerous goods. These articles, as packaged for transport, shall fulfil the criteria for Division 1.4S, when tested in accordance with test series 6(c) of section 16 of part 1 of the Manual of Tests and Criteria. The device shall be transported with either the means of activation removed or equipped with at least two independent means to prevent accidental activation.

Fire suppressant dispersing devices shall only be assigned to Class 9, UN 3559 if the following additional conditions are met:

- (a) The device meets the exclusion criteria in 2.1.3.6.4 (b), (c) and (d);
- (b) The suppressant shall be deemed safe for normally occupied spaces in compliance with international or regional standards (e.g. NFPA2010);
- (c) The article shall be packaged in a manner such that when activated, temperatures of the outside of the package shall not exceed 200°C;
- (d) This entry shall be used only with the approval of the competent authority of the country manufacture.

**SP No.**

- This entry does not apply to "SAFETY DEVICES, electrically initiated" described in special provision 280 (UN 3268).
- 408 This entry applies only to aqueous solutions comprised of water, tetramethylammonium hydroxide (TMAH), and no more than 1% other constituents. Other formulations containing tetramethylammonium hydroxide must be assigned to an appropriate generic or N.O.S. entry (e.g., UN 2927, TOXIC LIQUID, CORROSIVE, ORGANIC, N.O.S., etc), except as follows:
- (a) Other formulations containing a surfactant in a concentration > 1% and with not less than 8.75% tetramethylammonium hydroxide must be assigned to UN 2927, TOXIC LIQUID, CORROSIVE, ORGANIC, N.O.S., PG I; and
  - (b) Other formulations containing a surfactant in a concentration > 1% and with more than 2.38% but less than 8.75% tetramethylammonium hydroxide must be assigned to UN 2927, TOXIC LIQUID, CORROSIVE, ORGANIC, N.O.S., PG II.
- 409 The provisions of chapter 3.2 from the twenty-second revised edition of the Recommendations on the Transport of Dangerous Goods, Model Regulations may continue to be applied until 31 December 2026.

### 3.3.3

### AUSTRALIAN SPECIAL PROVISIONS

The Special Provisions in this Section 3.3.3 are peculiar to this Code and are therefore not applicable to international transport, or to air or sea transport within Australia.

#### SP No.

- AU01 Environmentally Hazardous Substances meeting the descriptions of UN 3077 or UN 3082 are not subject to this Code when transported by road or rail in;
- (a) packagings that do not incorporate a receptacle exceeding 500 kg(L); or
  - (b) IBCs.
- AU02 GAS OIL or DIESEL OIL or HEATING OIL, LIGHT or PETROLEUM DISTILLATE is not subject to this Code if it does not meet the criteria of chapter 2.3 for assignment to Class 3; i.e. if the flash point is more than 60°C and the substance is not offered for transport at a temperature above its flash point.
- Such substances will normally be C1 combustible liquids which are not classified as dangerous goods for transport purposes. However, the presence of a C1 combustible liquid in one or more compartments of a tank vehicle or portable tank transporting other refined petroleum products must be considered when determining the application of UN Number 1270 in accordance with 3.2.5.4 and 5.3.1.3.3.
- AU03 Unodourised LP Gas or Propane or Butane may only be transported if each of the following conditions is met:
- (a) each route used for the transport must have been determined by an appropriate risk management assessment; and
  - (b) each load must be accompanied by a gas detector suitable for the detection of LP Gas or Propane or Butane, in accordance with AS 1596, and by a person trained in its operation; and
  - (c) that person must use the gas detector to check for the presence of LP Gas or Propane or Butane in the vicinity of the load at each routine stop that the vehicle makes, and on any other occasion when there is a significant risk that LP Gas may have leaked, and must record in writing the details of each test; and
  - (d) the word "Unodourised" must be included as part of the shipping name displayed on vehicle emergency information panels; and
  - (e) a copy of the Transport Emergency Response Plan must be provided to the relevant hazmat incident combat agency, before the journey commences.
- AU04 Natural 'greasy wool' fleece and bales are not subject to this Code.

**SP No.**

- AU05 <omitted>
- AU06 GMMOs and GMOs to which 2.9.2.1 applies are not subject to this Code.
- AU07 UN 1017 CHLORINE has a subsidiary hazard 5.1, as well as 8. Despite this, when transported in cylinders, pressure drums, MEGCs or tanks, chlorine gas is not considered incompatible with dangerous goods of Class 8 or 9, or Division 6.1, or combustible liquids.
- AU08 For automotive batteries, the acid volume may be used when calculating the aggregate quantity of dangerous goods in the load.
- If the acid volume is not known, a nominal figure of 25% of the gross weight of the battery may be used.

## CHAPTER 3.4: DANGEROUS GOODS PACKED IN LIMITED QUANTITIES

### Introductory Notes

**NOTE 1:** Chapter 3.4 was amended in 2020 (Code Edition 7.7).

*The provisions in this chapter set out the following requirements:*

- packing design and construction
- marking and labelling of packaging
- segregation
- use of overpacks
- transport documentation

*Other relevant provisions of the Code, dealing with matters not provided for in this chapter, continue to apply. In the event of inconsistency or duplication between this chapter and other provisions of the Code, the provisions of this Chapter prevail.*

**NOTE 2:** Under Regulation 1.1.5, 1.1.6 or 1.1.7, the transport of certain small quantities of dangerous goods may be conditionally exempt from the Regulations and this Code.

**NOTE 3:** The concessions in this chapter also apply to Domestic Consumable Dangerous Goods (defined in 1.2.1) that are packed and intended for retail distribution

**NOTE 4:** When transporting UN0337 fireworks (bon bons, party poppers and sparklers only) refer to the relevant jurisdictional explosives regulations for any additional requirements.

### 3.4.1 LIMITED QUANTITY AMOUNTS

A quantity of dangerous goods is a limited quantity if:

- (a) The dangerous goods has a limited quantity amount (more than 0), listed in column 7a Limited Quantities in the Dangerous Goods List, Table 3.2.3; and
- (b) The dangerous goods are packed in an inner packaging with:
  - (i) if solids, a mass that is less than or equal to the number shown in column 7a of the Dangerous Goods List, Table 3.2.3, when that number is expressed in kilograms;
  - (ii) if liquids, a volume that is less than or equal to the number shown in column 7a of the Dangerous Goods List, Table 3.2.3 when that number is expressed in litres;
  - (iii) if gases, including a gas in a liquefied form, are contained in one or more means of containment each of which has a capacity less than or equal to the number shown in column 7a of the Dangerous Goods List, Table 3.2.3, when that number is expressed in litres.

### 3.4.2 PACKAGING REQUIREMENTS FOR LIMITED QUANTITIES

3.4.2.1 General requirements applicable to all packagings used for dangerous goods packed in limited quantities.

Dangerous goods transported in accordance with this chapter must be packed in packages that meet the following criteria:

- (a) packagings must be designed, constructed, filled, closed, secured and maintained so that under normal conditions of transport, including handling, there will be no accidental release of the dangerous goods; and
- (b) all packagings must meet the provisions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8; and
- (c) all packagings must meet the construction requirements of 6.1.4, 6.2.1.2 and 6.2.4; and
- (d) for articles of Division 1.4, Compatibility Group S, packagings must also fully comply with the provisions of 4.1.5.

3.4.2.2 Inner packagings are compulsory, except for articles such as aerosols or “receptacles, small, containing gas.

3.4.2.3 Intermediate packagings:

- (a) are compulsory for liquid goods of Class 8, packing group II which have inner packagings of glass, porcelain or stoneware. The intermediate packaging must be compatible and rigid.
- (b) are compulsory for inner packagings that are liable to break or be easily punctured, such as those made of glass, porcelain, stoneware or certain plastics where the outer packaging is shrink wrapped or stretch wrapped.
- (c) may be used at any other time.

3.4.2.4 Outer packagings

Limited quantities must be packed in an outer packaging which must meet the following criteria:

- (a) dangerous goods packed in limited quantities amounts must be placed in a suitable outer packaging
- (b) except for articles of Division 1.4, Compatibility Group S, shrink wrapped or stretch wrapped trays meeting the conditions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8 are acceptable as outer packagings, provided the total gross mass of the package does not exceed 20kg
- (c) inner packagings that are liable to break or be easily punctured must be packed in outer packagings not exceeding a total gross mass of 20kg.
- (d) all other outer packagings must not exceed a total gross mass of 30kg.

**3.4.3 RESERVED**

**3.4.4 RESERVED**

**3.4.5 RESERVED**

**3.4.6 SEGREGATION FOR PACKAGES CONTAINING LIMITED QUANTITIES**

3.4.6.1 Different dangerous goods packed in limited quantities may be placed in the same outer packaging provided they will not interact dangerously in the event of leakage.

3.4.6.2 Any segregation provisions elsewhere in this Code do not apply to dangerous goods packed in limited quantities within a cargo transport unit. This includes the need to segregate food and food packaging.

**3.4.7 MARK FOR PACKAGES CONTAINING LIMITED QUANTITIES**

3.4.7.1 Except for air transport, packages containing dangerous goods in limited quantities must bear the mark shown in figure 3.4.1:

**Figure 3.4.1: Mark for packages containing limited quantities**

The mark must be readily visible, legible and able to withstand open weather exposure without a substantial reduction in effectiveness.

The mark must be in the form of a square set at an angle of 45 degrees (diamond-shaped). The top and bottom portions and the surrounding line must be black. The centre area must be white or a suitable contrasting background. The minimum dimensions must be 100 mm x 100 mm and the minimum width of line forming the diamond must be 2 mm. Where dimensions are not specified, all features must be in approximate proportion to those shown.

3.4.7.2 If the size of the package so requires, the minimum outer dimensions shown in figure 3.4.1 may be reduced to be not less than 50 mm x 50 mm provided the mark remains clearly visible. The minimum width of the line forming the diamond may be reduced to a minimum of 1 mm.

### 3.4.8 MARK FOR PACKAGES CONTAINING LIMITED QUANTITIES CONFORMING TO PART 3, CHAPTER 4 OF THE ICAO TECHNICAL INSTRUCTIONS FOR THE SAFE TRANSPORT OF DANGEROUS GOODS BY AIR

3.4.8.1 Packages containing dangerous goods packed in conformity with the provisions of part 3, chapter 4 of the ICAO Technical Instructions for the Transport of Dangerous Goods may bear the mark shown in figure 3.4.2 to certify conformity with these provisions:

**Figure 3.4.2: Mark for packages containing limited quantities conforming to Part 3, Chapter 4 of the ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air**

The mark must be readily visible, legible and able to withstand open weather exposure without a substantial reduction in effectiveness.

The mark must be in the form of a square set at an angle of 45 degrees (diamond-shaped). The top and bottom portions and the surrounding line must be black. The centre area must be white or a suitable contrasting background. The minimum dimensions must be 100 mm x 100 mm and the minimum width of the line forming the diamond must be 2 mm. The symbol "Y" must be placed in the centre of the mark and must be clearly visible. Where dimensions are not specified, all features must be in approximate proportion to those shown.

3.4.8.2 If the size of the package so requires, the minimum outer dimensions shown in figure 3.4.2 may be reduced to be not less than 50 mm x 50 mm provided the mark remains clearly visible. The minimum width of the line forming the diamond may be reduced to a minimum of 1 mm. The symbol "Y" must remain in approximate proportion to that shown in figure 3.4.2.

3.4.8.3 Packages containing dangerous goods bearing the mark shown in 3.4.8 with or without the additional labels and marks for air transport must be deemed to meet the provisions of section 3.4.1 as appropriate and of sections 3.4.2 to 3.4.7 and need not bear the mark shown in 3.4.7.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.4.8.4       | Packages containing dangerous goods in limited quantities bearing the mark shown in 3.4.8.1 and conforming with the provisions of the ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air, including all necessary marks and labels specified in Parts 5 and 6, must be deemed to meet the provisions of section 3.4.1 as appropriate and of sections 3.4.2 to 3.4.7 when transported by land or by sea.                                                                                                                                                                                                                                                    |
| <b>3.4.9</b>  | <b>RESERVED</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>3.4.10</b> | <b>RESERVED</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>3.4.11</b> | <b>USE OF OVERPACKS</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3.4.11.1      | <p>For an overpack containing dangerous goods packed in limited quantities, the following applies:</p> <p>Unless the marks representative of all dangerous goods in an overpack are visible, the overpack must be:</p> <ul style="list-style-type: none"> <li>(a) marked with the word "OVERPACK". The lettering of the "OVERPACK" mark shall be at least 12 mm high; and</li> <li>(b) marked with the marks required by this chapter.</li> </ul> <p>Except for air transport, the other provisions of 5.1.2.1 apply only if other dangerous goods which are not packed in limited quantities are contained in the overpack and only in relation to these other dangerous goods.</p> |
| 3.4.11.2      | Despite 3.4.11.1, an overpack intended only for transport by road or rail within Australia need not be marked with the word "OVERPACK".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>3.4.12</b> | <b>INFORMATION TO BE AVAILABLE DURING TRANSPORT</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3.4.12.1      | <p>Prior to transporting, the consignor of the dangerous goods packed in limited quantities must inform the prime contractor, in a form readily ascertainable during transport, of:</p> <ul style="list-style-type: none"> <li>(a) the total gross mass of such goods to be consigned, and, if the goods consist of multiple consignments for different consignees, the gross mass of each consignment; and</li> <li>(b) if the goods to be consigned include an aggregate quantity of 2000 kg(L) or greater of any one UN Number - the UN Number, Proper Shipping Name and total aggregate quantity for that UN number.</li> </ul>                                                  |
| 3.4.12.2      | The prime contractor must ensure that the information provided to them under 3.4.12.1 is readily ascertainable during transport of the dangerous goods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 3.4.13

### DOCUMENTATION

#### 3.4.13.1

A dangerous goods transport document is not required for dangerous goods that meet the requirements of this chapter.

#### 3.4.13.2

Any transport document for the consignment (e.g. consignment note, bill of lading, etc.) must include the notation 'Contains Dangerous Goods Packed in Limited Quantities'

**NOTE 1:** *Placard limit requirements for Limited Quantities (LQ) are set out in Table 5.3.*

**NOTE 2:** *Appropriate placards for limited quantity loads are given in 5.2.2.2.3 and 5.2.2.2.4.*

## CHAPTER 3.5: DANGEROUS GOODS PACKED IN EXCEPTED QUANTITIES

### 3.5.1 EXCEPTED QUANTITIES

3.5.1.1 Excepted quantities of dangerous goods of certain classes, other than articles, meeting the provisions of this chapter are not subject to any other provisions of this Code except for:

- (a) The training requirements in chapter 1.3;
- (b) The classification procedures and packing group criteria in Part 2;
- (c) The packaging requirements of 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.4.1 and 4.1.1.6.

**NOTE:** *In the case of radioactive material, the requirements for radioactive material in excepted packages in 1.5.1.5 apply.*

3.5.1.2 Dangerous goods which may be carried as excepted quantities in accordance with the provisions of this chapter are shown in column 7b of the dangerous goods list of chapter 3.2 by means of an alphanumeric code as follows:

| Code | Maximum net quantity per inner packaging (in grams for solids and ml for liquids and gases) | Maximum net quantity per outer packaging (in grams for solids and ml for liquids and gases, or sum of grams and ml in the case of mixed packing) |
|------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| E0   | Not permitted as Excepted Quantity                                                          |                                                                                                                                                  |
| E1   | 30                                                                                          | 1000                                                                                                                                             |
| E2   | 30                                                                                          | 500                                                                                                                                              |
| E3   | 30                                                                                          | 300                                                                                                                                              |
| E4   | 1                                                                                           | 500                                                                                                                                              |
| E5   | 1                                                                                           | 300                                                                                                                                              |

For gases, the volume indicated for inner packagings refers to the water capacity of the inner receptacle and the volume indicated for outer packagings refers to the combined water capacity of all inner packagings within a single outer packaging.

3.5.1.3 Where dangerous goods in excepted quantities for which different codes are assigned are packaged together the total quantity per outer packaging shall be limited to that corresponding to the most restrictive code.

3.5.1.4 Excepted quantities of dangerous goods assigned to codes E1, E2, E4 and E5 are not subject to this Code provided that:

- (a) The maximum net quantity of material per inner packaging is limited to 1 ml for liquids and gases and 1 g for solids;
- (b) The provisions of 3.5.2 are met, except that an intermediate packaging is not required if the inner packagings are securely packed in an outer packaging with cushioning material in such a way that, under normal conditions of transport, they cannot break, be punctured, or leak their contents; and for liquids, the outer packaging contains sufficient absorbent material to absorb the entire contents of the inner packagings;
- (c) The provisions of 3.5.3 are complied with; and
- (d) The maximum net quantity of dangerous goods per outer packaging does not exceed 100 g for solids or 100 ml for liquids and gases.

### 3.5.2

### PACKAGINGS

Packagings used for the transport of dangerous goods in excepted quantities shall be in compliance with the following:

- (a) There shall be an inner packaging and each inner packaging shall be constructed of plastic (when used for liquid dangerous goods it shall have a thickness of not less than 0.2 mm), or of glass, porcelain, stoneware, earthenware or metal (see also 4.1.1.2) and the closure of each inner packaging shall be held securely in place with wire, tape or other positive means; any receptacle having a neck with moulded screw threads shall have a leak proof threaded type cap. The closure shall be resistant to the contents;
- (b) Each inner packaging shall be securely packed in an intermediate packaging with cushioning material in such a way that, under normal conditions of transport, it cannot break, be punctured or leak its contents. For liquid dangerous goods, the intermediate or outer packaging shall contain sufficient absorbent material to absorb the entire contents of the inner packagings. When placed in the intermediate packaging, the absorbent material may be the cushioning material. Dangerous goods shall not react dangerously with cushioning, absorbent material and packaging material or reduce the integrity or function of the materials. Regardless of its orientation, the package shall completely contain the contents in case of breakage or leakage;
- (c) The intermediate packaging shall be securely packed in a strong, rigid outer packaging (wooden, fibreboard or other equally strong material);
- (d) Each package type shall be in compliance with the provisions in 3.5.3;
- (e) Each package shall be of such a size that there is adequate space to apply all necessary marks; and
- (f) Overpacks may be used and may also contain packages of dangerous goods or goods not subject to this Code.

### 3.5.3

### TESTS FOR PACKAGES

#### 3.5.3.1

The complete package as prepared for transport, with inner packagings filled to not less than 95% of their capacity for solids or 98% for liquids, shall be capable of withstanding, as demonstrated by testing which is appropriately documented, without breakage or leakage of any inner packaging and without significant reduction in effectiveness:

- (a) Drops onto a rigid, non-resilient, flat and horizontal surface from a height of 1.8 m:
  - (i) Where the sample is in the shape of a box, it shall be dropped in each of the following orientations:
    - flat on the base;
    - flat on the top;
    - flat on the longest side;
    - flat on the shortest side;
    - on a corner;
  - (ii) Where the sample is in the shape of a drum, it shall be dropped in each of the following orientations:
    - diagonally on the top chime, with the centre of gravity directly above the point of impact;
    - diagonally on the base chime;
    - flat on the side.

**NOTE:** Each of the above drops may be performed on different but identical packages.

- (b) A force applied to the top surface for a duration of 24 hours, equivalent to the total weight of identical packages if stacked to a height of 3 m (including the sample).

#### 3.5.3.2

For the purposes of testing, the substances to be transported in the packaging may be replaced by other substances except where this would invalidate the results of the tests. For solids, when another substance is used, it must have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. In the drop tests for liquids, when another substance is used, its relative density (specific gravity) and viscosity should be similar to those of the substance to be transported.

### 3.5.4

### MARKING OF PACKAGES

#### 3.5.4.1

Packages containing excepted quantities of dangerous goods prepared in accordance with this chapter shall be durably and legibly marked with the mark shown in Figure 3.5.1. The primary hazard class or, when assigned, the division of each of the dangerous goods contained in the package shall be shown in the mark. Where the name of the consignor or consignee is not shown elsewhere on the package this information shall be included within the mark.

#### 3.5.4.2

Excepted quantities mark.

#### **Figure 3.5.1: Excepted quantities mark**

\* The Class or, when assigned, the Division number(s) shall be shown in this location.

\*\* The name of the consignor or of the consignee shall be shown in this location if not shown elsewhere on the package.

The mark shall be in the form of a square. The hatching and symbol shall be of the same colour, black or red, on white or suitable contrasting background. The minimum dimensions shall be 100 mm x 100 mm. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

#### 3.5.4.3

##### Use of overpacks

For an overpack containing dangerous goods packed in excepted quantities, the following applies:

Unless the marks representative of all dangerous goods in an overpack are visible, the overpack shall be:

- (a) marked with the word "OVERPACK". The lettering of the "OVERPACK" mark shall be at least 12 mm high; and
- (b) marked with the marks required by this chapter.

The other provisions of 5.1.2.1 apply only if other dangerous goods which are not packed in excepted quantities are contained in the overpack and only in relation to these other dangerous goods.

*Note: 5.1.2.1.2 provides that an overpack intended only for transport by road or rail within Australia need not be marked with the word "OVERPACK".*

#### 3.5.5

##### MAXIMUM NUMBER OF PACKAGES IN A CARGO TRANSPORT UNIT

The number of packages in any cargo transport unit shall not exceed 1000.

### **3.5.6**

### **DOCUMENTATION**

#### **3.5.6.1**

A dangerous goods transport document is not required for dangerous goods that meet the requirements of this chapter.

#### **3.5.6.2**

If a document (such as a bill of lading or air waybills) accompanies dangerous goods in excepted quantities, it shall include the statement “Dangerous Goods in Excepted Quantities” and indicate the number of packages.

# **PART 4**

## **PACKING, TANK, CONTAINER, VEHICLE AND EQUIPMENT PROVISIONS**

## CHAPTER 4.1: USE OF PACKAGINGS, INCLUDING INTERMEDIATE BULK CONTAINERS (IBCs) AND LARGE PACKAGINGS

### Introductory Notes

**NOTE 1:** This part reproduces in full the Packing provisions of Part 4 of UN23. It includes detailed Packing Instructions for all classes of dangerous goods, as referenced from column 8 (for packages, IBCs and Large Packagings) and column 10 (for portable tanks and bulk containers) of the Dangerous Goods List in Chapter 3.2, together with special packing provisions as referenced from columns 9 and 11.

**NOTE 2:** For Class 1 and Class 7 dangerous goods which are not subject to this Code except and insofar as they are transported with other dangerous goods, the information is provided for guidance only. For those classes, reference should be made to the Australian Explosives Code and the Codes of Practice for the Safe Transport of Radioactive Substances. The use of Packing Instructions from this Chapter that are not included in those Codes may require approval from the relevant Competent Authority.

#### 4.1.1 GENERAL PROVISIONS FOR THE PACKING OF DANGEROUS GOODS IN PACKAGINGS, INCLUDING IBCS AND LARGE PACKAGINGS

**NOTE:** The general provisions of this section apply to all dangerous goods in packagings. However they only apply to the packing of goods of Class 2 and Division 6.2 where indicated in 4.1.8.2 (Division 6.2, UN 2814 and UN 2900) and in the applicable packing instructions of 4.1.4 (P201, P207 and LP02 for Class 2 and P620, P621, P622, IBC620, LP621 and LP622 for Division 6.2).

- 4.1.1.1 Dangerous goods must be packed in good quality packagings, including IBCs and large packagings, which must be strong enough to withstand the shocks and loadings normally encountered during transport, including trans-shipment between cargo transport units and between cargo transport units and warehouses as well as any removal from a pallet or overpack for subsequent manual or mechanical handling. Packagings, including IBCs and large packagings, must be constructed and closed so as to prevent any loss of contents when prepared for transport which may be caused under normal conditions of transport, by vibration, or by changes in temperature, humidity or pressure (resulting from altitude, for example). Packagings, including IBCs and large packagings, must be closed in accordance with the information provided by the manufacturer. No dangerous residue must adhere to the outside of packages, IBCs and large packagings during transport. These provisions apply, as appropriate, to new, reused, reconditioned or remanufactured packagings, and to new, reused, repaired or remanufactured IBCs, and to new, reused or remanufactured large packagings.
- 4.1.1.2 Parts of packagings, including IBCs and large packagings, which are in direct contact with dangerous goods:
- (a) must not be affected or significantly weakened by those dangerous goods;

- (b) must not cause a dangerous effect e.g. catalysing a reaction or reacting with the dangerous goods; and
- (c) must not allow permeation of the dangerous goods that could constitute a danger under normal conditions of transport.

Where necessary, they must be provided with a suitable inner coating or treatment.

- 4.1.1.3 Unless provided elsewhere in this Code, each packaging, including IBCs and large packagings, except inner packagings, must conform to a design type successfully tested in accordance with the requirements of 6.1.5, 6.3.5, 6.5.6 or 6.6.5, as applicable.
- However, IBCs manufactured before 1 January 2011 and conforming to a design type which has not passed the vibration test of 6.5.6.13 or which was not required to meet the criteria of 6.5.6.9.5 (d) at the time it was subjected to the drop test, may still be used.
- 4.1.1.3.1 Packagings, including IBCs and large packagings, may conform to one or more than one successfully tested design type and may bear more than one mark.
- 4.1.1.4 When filling packagings, including IBCs and large packagings, with liquids, sufficient ullage (outage) must be left to ensure that neither leakage nor permanent distortion of the packaging occurs as a result of an expansion of the liquid caused by temperatures likely to occur during transport. Unless specific requirements are prescribed, liquids must not completely fill a packaging at a temperature of 55 °C. However, sufficient ullage must be left in an IBC to ensure that at the mean bulk temperature of 50 °C it is not filled to more than 98% of its water capacity.
- 4.1.1.4.1 For air transport, packagings intended to contain liquids must also be capable of withstanding a pressure differential without leakage as specified in the international regulations for air transport.
- 4.1.1.5 Inner packagings must be packed in an outer packaging in such a way that, under normal conditions of transport, they cannot break, be punctured or leak their contents into the outer packaging. Inner packagings containing liquids must be packaged with their closures upward and placed within outer packagings consistent with any orientation marks (see 5.2.1.7). Inner packagings that are liable to break or be punctured easily, such as those made of glass, porcelain or stoneware or of certain plastics materials, etc., must be secured in outer packagings with suitable cushioning material. Any leakage of the contents must not substantially impair the protective properties of the cushioning material or of the outer packaging.
- 4.1.1.5.1 Where an outer packaging of a combination packaging or a large packaging has been successfully tested with different types of inner packagings, a variety of such different inner packagings may also be assembled in this outer packaging or large packaging. In addition, provided an equivalent level of performance is maintained, the following variations in inner packagings are allowed without further testing of the package:

- (a) Inner packagings of equivalent or smaller size may be used provided:
  - (i) The inner packagings are of similar design to the tested inner packagings (e.g. shape - round, rectangular, etc.);
  - (ii) The material of construction of the inner packagings (glass, plastics, metal, etc.) offers resistance to impact and stacking forces equal to or greater than that of the originally tested inner packaging;
  - (iii) The inner packagings have the same or smaller openings and the closure is of similar design (e.g. screw cap, friction lid, etc.);
  - (iv) Sufficient additional cushioning material is used to take up void spaces and to prevent significant movement of the inner packagings; and
  - (v) Inner packagings are oriented within the outer packaging in the same manner as in the tested package.
- (b) A lesser number of the tested inner packagings, or of the alternative types of inner packagings identified in (a) above, may be used provided sufficient cushioning is added to fill the void space(s) and to prevent significant movement of the inner packagings.

4.1.1.5.2 Use of supplementary packagings within an outer packaging (e.g. an intermediate packaging or a receptacle inside a required inner packaging) additional to what is required by the packing instructions is authorised provided all relevant requirements are met, including those of 4.1.1.3, and, if appropriate, suitable cushioning is used to prevent movement within the packaging.

4.1.1.6 Dangerous goods must not be packed together in the same outer packaging or in large packagings, with dangerous or other goods if they react dangerously with each other and cause:

- (a) Combustion and/or evolution of considerable heat;
- (b) Evolution of flammable, toxic or asphyxiant gases;
- (c) The formation of corrosive substances; or
- (d) The formation of unstable substances.

4.1.1.7 The closures of packagings containing wetted or diluted substances must be such that the percentage of liquid (water, solvent or phlegmatiser) does not fall below the prescribed limits during transport.

4.1.1.7.1 Where two or more closure systems are fitted in series on an IBC, that nearest to the substance being carried must be closed first.

4.1.1.8 Where pressure may develop in a package by the emission of gas from the contents (as a result of temperature increase or other causes), the packaging or IBC, may be fitted with a vent, provided that the gas emitted will not cause danger on account of its toxicity, its flammability or quantity released, for example.

A venting device must be fitted if dangerous overpressure may develop due to normal decomposition of substances. The vent must be so designed that, when the packaging or IBC is in the attitude in which it is intended to be transported, leakages of liquid and the penetration of foreign substances are prevented under normal conditions of transport.

- 4.1.1.8.1 Liquids may only be filled into inner packagings which have an appropriate resistance to internal pressure that may be developed under normal conditions of transport.
- 4.1.1.8.2 Venting of the package is not permitted for air transport.
- 4.1.1.9 New, remanufactured or reused packagings, including IBCs and large packagings, or reconditioned packagings and repaired or routinely maintained IBCs must be capable of passing the tests prescribed in 6.1.5, 6.3.5, 6.5.6 or 6.6.5, as applicable. Before being filled and handed over for transport, every packaging, including IBCs and large packagings, must be inspected to ensure that it is free from corrosion, contamination or other damage and every IBC must be inspected with regard to the proper functioning of any service equipment. Any packaging, which shows signs of reduced strength as compared with the approved design type must no longer be used or must be so reconditioned, that it is able to withstand the design type tests. Any IBC which shows signs of reduced strength as compared with the tested design type must no longer be used or must be so repaired or routinely maintained that it is able to withstand the design type tests.
- 4.1.1.10 Liquids must be filled only into packagings, including IBCs, which have an appropriate resistance to the internal pressure that may develop under normal conditions of transport. Packagings and IBCs marked with the hydraulic test pressure prescribed in 6.1.3.1(d) and 6.5.2.2.1, respectively, must be filled only with a liquid having a vapour pressure:
- (a) such that the total gauge pressure in the packaging or IBC (i.e. the vapour pressure of the filling substance plus the partial pressure of air or other inert gases, less 100 kPa) at 55 °C, determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C, will not exceed two thirds of the marked test pressure; or
  - (b) at 50 °C less than four sevenths of the sum of the marked test pressure plus 100 kPa; or
  - (c) at 55 °C less than two thirds of the sum of the marked test pressure plus 100 kPa.
- IBCs intended for the transport of liquids must not be used to carry liquids having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C or 130 kPa (1.3 bar) at 55 °C.
- Examples of required marked test pressures for packagings, including IBCs, calculated as in 4.1.1.10 (c)**

| UN No. | Name             | Class | Packing group | Vp55 (kPa) | Vp55x1.5 (kPa) | (Vp55 x 1.5) minus 100 (kPa) | Required minimum test pressure gauge under 6.1.5.5.4. (c) (kPa) | Minimum test pressure (gauge) to be marked on the packaging (kPa) |
|--------|------------------|-------|---------------|------------|----------------|------------------------------|-----------------------------------------------------------------|-------------------------------------------------------------------|
| 2056   | Tetrahydrofuran  | 3     | II            | 70         | 105            | 5                            | 100                                                             | 100                                                               |
| 2247   | n-Decane         | 3     | III           | 1.4        | 2.1            | -97.9                        | 100                                                             | 100                                                               |
| 1593   | Dichloro-methane | 6.1   | III           | 164        | 246            | 146                          | 146                                                             | 150                                                               |
| 1155   | Diethyl ether    | 3     | I             | 199        | 299            | 199                          | 199                                                             | 250                                                               |

**NOTE 1:** For pure liquids the vapour pressure at 55 °C (Vp55) can often be obtained from scientific tables.

**NOTE 2:** The table refers to the use of 4.1.1.10(c) only, which means that the marked test pressure must exceed 1.5 times the vapour pressure at 55 °C less 100 kPa. When, for example, the test pressure for n-decane is determined according to 6.1.5.5.4 (a), the minimum marked test pressure may be lower.

**NOTE 3:** For diethyl ether the required minimum test pressure under 6.1.5.5.5 is 250 kPa.

4.1.1.11 Empty packagings, including IBCs and large packagings, that have contained a dangerous substance, must be treated in the same manner as is required by this Code for a filled packaging, unless adequate measures have been taken to nullify any hazard.

4.1.1.12 Every packaging as specified in Chapter 6.1 intended to contain liquids must successfully undergo a suitable leakproofness test. This test is part of a quality assurance programme as stipulated in 6.1.1.4 which shows the capability of meeting the appropriate test level indicated in 6.1.5.4.3:

- (a) before it is first used for transport, except as permitted by 4.1.1.12.1;
- (b) after remanufacturing or reconditioning of any packaging, before it is re-used for transport;

For this test the packaging need not have its closures fitted. The inner receptacle of a composite packaging may be tested without the outer packaging, provided the test results are not affected. This test is not necessary for inner packagings of combination packagings or large packagings.

4.1.1.12.1 Except where tested in accordance with 4.1.1.12, the leakproofness of tinsplate cans constructed in accordance with AS 2854 and having a capacity not exceeding 15 L must be assured in accordance with a quality management system that complies with AS/NZS ISO 9001 or equivalent.

- 4.1.1.13 Packagings, including IBCs, used for solids which may become liquid at temperatures likely to be encountered during transport must also be capable of containing the substance in the liquid state.
- 4.1.1.14 Packagings, including IBCs, used for powdery or granular substances must be siftproof or must be provided with a liner.
- 4.1.1.15 For plastics drums and jerricans, rigid plastics IBCs and composite IBCs with plastics inner receptacles, unless otherwise exempted by the competent authority, the period of use permitted for the transport of dangerous substances is five years from the date of manufacture of the receptacles, except where a shorter period of use is prescribed because of the nature of the substance to be transported.
- NOTE: For composite IBCs the period of use refers to the date of manufacture of the inner receptacle.*
- 4.1.1.16 Where ice is used as a coolant it must not affect the integrity of the packaging.
- 4.1.1.17 Explosives, self-reactive substances and organic peroxides**
- Unless specific provision to the contrary is made in this Code or the Australian Explosives Code, the packagings, including IBCs and large packagings, used for goods of Class 1, self-reactive substances of Division 4.1 and organic peroxides of Division 5.2 must comply with the provisions for the medium danger group (packing group II).
- 4.1.1.18 Use of salvage packagings and large salvage packagings**
- 4.1.1.18.1 Damaged, defective, leaking or non-conforming packages, or dangerous goods that have spilled or leaked may be transported in salvage packagings mentioned in 6.1.5.1.11 and 6.6.5.1.9. This does not prevent the use of a larger size packaging or large packaging of appropriate type and performance level under the conditions of 4.1.1.18.2 and 4.1.1.18.3.
- 4.1.1.18.2 Appropriate measures must be taken to prevent excessive movement of the damaged or leaking packages within a salvage packaging. When the salvage packaging contains liquids, sufficient inert absorbent material must be added to eliminate the presence of free liquid.
- 4.1.1.18.3 Appropriate measures must be taken to ensure there is no dangerous build up of pressure.
- 4.1.1.19 Use of salvage pressure receptacles**
- 4.1.1.19.1 In the case of damaged, defective, leaking or non-conforming pressure receptacles, salvage pressure receptacles according to 6.2.3 may be used.
- NOTE: A salvage pressure receptacle may be used as an overpack in accordance with 5.1.2. When used as an overpack, marks must be in accordance with 5.1.2.1 instead of 5.2.1.3.*

- 4.1.1.19.2 Pressure receptacles must be placed in salvage pressure receptacles of suitable size. More than one pressure receptacle may be placed in the same salvage pressure receptacle only if the contents are known and do not react dangerously with each other (see 4.1.1.6). In this case the total sum of water capacities of the placed pressure receptacles must not exceed 3,000 litres. Measures must be taken to prevent movement of the pressure receptacles within the salvage pressure receptacle e.g. by partitioning, securing or cushioning.
- 4.1.1.19.3 A pressure receptacle may only be placed in a salvage pressure receptacle if:
- (a) The salvage pressure receptacle is in accordance with 6.2.3.5 and a copy of the approval certificate is available;
  - (b) Parts of the salvage pressure receptacle which are, or are likely to be in direct contact with the dangerous goods will not be affected or weakened by those dangerous goods and will not cause a dangerous effect (e.g. catalyzing reaction or reacting with the dangerous goods); and
  - (c) The contents of the contained pressure receptacle(s) are limited in pressure and volume so that if totally discharged into the salvage pressure receptacle, the pressure in the salvage pressure receptacle at 65°C will not exceed the test pressure of the salvage pressure receptacle (for gases, see packing instruction in P200 (3) 4.1.4.1). The reduction of the useable water capacity of the salvage pressure receptacle, e.g. by any contained equipment and cushioning, must be taken into account.
- 4.1.1.19.4 The proper shipping name, the UN Number preceded by the letters "UN" and label(s) as required for packages in Chapter 5.2 applicable to the dangerous goods inside the contained pressure receptacle(s) must be applied to the salvage pressure receptacle for transport.
- 4.1.1.19.5 Salvage pressure receptacles must be cleaned, purged and visually inspected internally and externally after each use. They must be periodically inspected and tested in accordance with 6.2.1.6 at least once every five years.
- 4.1.1.20 Reuse of Packagings**
- 4.1.1.20.1 Each packaging must be examined before re-use. If the packaging exhibits signs of interior or exterior damage or deterioration affecting its ability to withstand performance testing, it must not be re-used to transport dangerous goods.
- 4.1.1.20.2 Plastics drums and jerricans must not be re-used to transport dangerous goods of packing group I.
- 4.1.1.20.3 A plastics packaging must not be re-used to transport dangerous goods more than five years after the date of its manufacture.
- 4.1.1.20.4 Before a packaging is reused for the transport of dangerous goods:
- (a) any irrelevant marks and labels must be removed;
  - (b) any packaging that uses a vented cap must be fitted with a new closure of original specification;

- (c) any composite packaging with a flexible plastics inner receptacle (other than a poly-lined steel drum) must be fitted with a new inner receptacle of original specification.

#### **4.1.1.21**

#### **Reprocessed steel drums**

##### **4.1.1.21.1**

A reprocessed steel drum must not be used to transport dangerous goods of packing group I.

##### **4.1.1.21.2**

A reprocessed steel drum must not be used to transport dangerous goods unless it is suitable for use with the dangerous goods in accordance with this Part and has been reprocessed in accordance with and subject to all the conditions imposed by Appendix D of this Code, the Code of Practice for Reprocessing Steel Drums.

#### **4.1.2**

#### **ADDITIONAL GENERAL PROVISIONS FOR THE USE OF IBCS**

##### **4.1.2.1**

When IBCs are used for the transport of liquids with a flash point of 60 °C (closed cup) or lower, or of powders liable to dust explosion, measures must be taken to prevent a dangerous electrostatic discharge.

##### **4.1.2.2**

Every metal, rigid plastics and composite IBC, must be inspected and tested, as relevant, in accordance with 6.5.4.4 or 6.5.4.5:

- before it is put into service;
- thereafter at intervals not exceeding two and a half and five years, as appropriate;
- after the repair or remanufacture, before it is re-used for transport.

An IBC must not be filled and offered for transport after the date of expiry of the last periodic test or inspection. However, an IBC filled prior to the date of expiry of the last periodic test or inspection may be transported for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, an IBC may be transported after the date of expiry of the last periodic test or inspection:

- (a) after emptying but before cleaning, for purposes of performing the required test or inspection prior to refilling; and
- (b) unless otherwise exempted by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection in order to allow the return of dangerous goods or residues for proper disposal or recycling. Reference to this exemption must be entered in the transport document.

##### **4.1.2.3**

IBCs of type 31HZ2 must be filled to at least 80% of the volume of the outer casing and always be carried in closed cargo transport units.

##### **4.1.2.4**

Except for routine maintenance of metal, rigid plastics, composite and flexible IBCs performed by the owner of the IBC, whose State and name or authorised symbol is durably marked on the IBC, the party performing routine maintenance must durably mark the IBC near the manufacturer's UN design type mark to show:

- (a) the State in which the routine maintenance was carried out; and
- (b) the name or authorised symbol of the party performing the routine maintenance.

### 4.1.3

## **GENERAL PROVISIONS CONCERNING PACKING INSTRUCTIONS**

#### 4.1.3.1

Packing instructions applicable to dangerous goods of Classes 1 to 9 are specified in 4.1.4. They are subdivided depending on the type of packagings to which they apply:

4.1.4.1 for packagings other than IBCs and large packagings; these packing instructions are designated by an alphanumeric code comprising the letter "P";

4.1.4.2 for IBCs; these are designated by an alphanumeric code comprising the letters "IBC";

4.1.4.3 for large packagings; these are designated by an alphanumeric code comprising the letters "LP".

Generally, packing instructions specify that the general provisions of 4.1.1, 4.1.2 and/or 4.1.3, as appropriate, are applicable. They may also require compliance with the special provisions of sections 4.1.5, 4.1.6, 4.1.7, 4.1.8 or 4.1.9 when appropriate. Special packing provisions may also be specified in the packing instruction for individual substances or articles. They are also designated by an alphanumeric code comprising the letters:

"PP" for packagings other than IBCs and large packagings

"B" for IBCs

"L" for large packagings.

Unless otherwise specified, each packaging must conform to the applicable requirements of Part 6. Generally packing instructions do not provide guidance on compatibility and the user should not select a packaging without checking that the substance is compatible with the packaging material selected (e.g. most fluorides are unsuitable for glass receptacles). Where glass receptacles are permitted in the packing instructions porcelain, earthenware and stoneware packagings are also allowed.

#### 4.1.3.2

Column 8 of the Dangerous Goods List shows for each article or substance the packing instruction(s) that must be used. Column 9 indicates the special packing provisions applicable to specific substances or articles.

- 4.1.3.3 Each packing instruction shows, where applicable, the acceptable single and combination packagings. For combination packagings, the acceptable outer packagings, inner packagings and when applicable the maximum quantity permitted in each inner or outer packaging, are shown. Maximum net mass and maximum capacity are as defined in 1.2.1. Where packagings which need not meet the requirements of 4.1.1.3 (e.g., crates, pallets, etc.) are authorized in a packing instruction or the special provisions named in the dangerous goods list, these packages are not subject to the mass or volume limits generally applicable to packagings conforming to the requirements of Chapter 6.1, unless otherwise indicated in the relevant packing instruction or special provision.
- 4.1.3.4 The following packagings must not be used when the substances being transported are liable to become liquid during transport:
- Packagings:
- Drums: 1D and 1G
  - Boxes: 4C1, 4C2, 4D, 4F, 4G and 4H1
  - Bags: 5L1, 5L2, 5L3, 5H1, 5H2, 5H3, 5H4, 5M1 and 5M2
  - Composite packagings:
    - 6HC, 6HD2, 6HG1, 6HG2, 6HD1, 6PC, 6PD1, 6PD2, 6PG1, 6PG2 and 6PH1
- Large packagings:
- Flexible plastics: 51H (outer packaging)
- IBCs:
- For substances of packing group I: All types of IBCs;
  - For substances of packing groups II and III:
    - Wooden: 11C, 11D and 11F
    - Fibreboard: 11G
    - Flexible: 13H1, 13H2, 13H3, 13H4, 13H5, 13L1, 13L2, 13L3, 13L4, 13M1 and 13M2
    - Composite: 11HZ2 and 21HZ2.
- 4.1.3.5 Where the packing instructions in this chapter authorise the use of a particular type of packaging (e.g. 4G; 1A2), packagings bearing the same packaging identification code followed by the letters "V", "U" or "W" marked in accordance with the requirements of Part 6 (e.g. 4GV, 4GU or 4GW; 1A2V, 1A2U or 1A2W) may also be used under the same conditions and limitations applicable to the use of that type of packaging according to the relevant packing instructions. For example, a combination packaging marked with the packaging code "4GV" may be used whenever a combination packaging marked "4G" is authorised, provided the requirements in the relevant packing instruction regarding types of inner packagings and quantity limitations are respected.
- 4.1.3.6 **Pressure receptacles for liquids and solids**
- 4.1.3.6.1 Unless otherwise indicated in this Code, pressure receptacles conforming to:

- (a) the applicable requirements of Chapter 6.2; or
- (b) the National or International standards on the design, construction, testing, manufacturing and inspection, as applied by the country in which the pressure receptacles are manufactured, provided that the provisions of 4.1.3.6 and 6.2.3.3 are met,

are authorised for the transport of any liquid or solid substance other than explosives, thermally unstable substances, organic peroxides, self-reactive substances, substances where significant pressure may develop by evolution of chemical reaction and radioactive material (unless permitted in 4.1.9).

This sub-section is not applicable to the substances mentioned in 4.1.4.1, packing instruction P200, Table 3.

- 4.1.3.6.2 Every design type of pressure receptacle must be approved by the competent authority of the country of manufacture or as indicated in Chapter 6.2.
- 4.1.3.6.3 Unless otherwise indicated, pressure receptacles having a minimum test pressure of 0.6 MPa must be used.
- 4.1.3.6.4 Unless otherwise indicated, pressure receptacles may be provided with an emergency pressure relief device designed to avoid bursting in case of overfill or fire accidents.  
  
Pressure receptacle valves must be designed and constructed in such a way that they are inherently able to withstand damage without release of the contents or must be protected from damage which could cause inadvertent release of the contents of the pressure receptacle, by one of the methods as given in 4.1.6.1.8 (a) to (e).
- 4.1.3.6.5 The level of filling must not exceed 95% of the capacity of the pressure receptacle at 50 °C. Sufficient ullage (outage) must be left to ensure that the pressure receptacle will not be liquid full at a temperature of 55 °C.
- 4.1.3.6.6 Unless otherwise indicated pressure receptacles must be subjected to a periodic inspection and test every 5 years. The periodic inspection must include an external examination, an internal examination or alternative method as approved by the competent authority, a pressure test or equivalent effective non-destructive testing with the agreement of the competent authority including an inspection of all accessories (e.g. tightness of valves, emergency relief valves or fusible elements). Pressure receptacles must not be filled after they become due for periodic inspection and test but may be transported after the expiry of the time limit. Pressure receptacle repairs must meet the requirements of 4.1.6.1.11.
- 4.1.3.6.7 Prior to filling, the pressure receptacle must be inspected to ensure that the pressure receptacle is authorised for the substances to be transported and that the provisions of this Code have been met. Shut-off valves must be closed after filling and remain closed during transport. A further inspection must verify that the closures and equipment are not leaking prior to consignment.

4.1.3.6.8 Refillable pressure receptacles must not be filled with a substance different from that previously contained unless the necessary operations for change of service have been performed.

4.1.3.6.9 Marking of pressure receptacles for liquids and solids according to 4.1.3.6 (not conforming to the requirements of Chapter 6.2) must be in accordance with the requirements of the competent authority of the country of manufacturing.

#### **4.1.3.7 Use of alternative packagings**

Packagings or IBCs not specifically authorised in the applicable packing instruction must not be used for the transport of a substance or article unless specifically determined by the competent authority and provided:

- (a) the alternative packaging complies with the general requirements of this Part;
- (b) when the packing instruction indicated in the Dangerous Goods List so specifies, the alternative packaging meets the requirements of Part 6;
- (c) the competent authority determines that the alternative packaging provides at least the same level of safety as if the substance were packed in accordance with a method specified in the particular packing instruction indicated in the Dangerous Goods List; and
- (d) a copy of the competent authority determination accompanies each consignment or the transport document includes all information required under the determination.

**NOTE:** *The competent authorities making such determinations should take action to amend this Code to include the provisions covered by the determination as appropriate.*

#### **4.1.3.8 Reserved**

4.1.3.9 Reprocessed steel drums may only be used as packagings for the transport of dangerous goods if they have been reprocessed in accordance with Appendix D. Reprocessed steel drums must not be used for the transport of dangerous goods of packing group I.

### **4.1.4 LIST OF PACKING INSTRUCTIONS**

#### **4.1.4.1 Packing instructions concerning the use of packagings (except IBCs and large packagings)**

**Table 4.1.4.1: Packing Instructions Concerning the Use of Packagings (Except IBCs and Large Packagings)**

| P001                                                                                                     |      | PACKING INSTRUCTION (LIQUIDS)           |                    |                   |        | P001 |
|----------------------------------------------------------------------------------------------------------|------|-----------------------------------------|--------------------|-------------------|--------|------|
| The following packagings are authorised provided that the general provisions of 4.1.1 and 4.1.3 are met: |      |                                         |                    |                   |        |      |
|                                                                                                          |      | Maximum capacity/net mass (see 4.1.3.3) |                    |                   |        |      |
|                                                                                                          |      | Packing Group I                         | Packing Group II   | Packing Group III |        |      |

|             | of 40 kg.                                                                                                                                                                                                                                        |      |
| <b>PP2</b>  | For UN 3065, wooden barrels with a maximum capacity of 250 litres and which do not meet the provisions of Chapter 6.1 may be used.                                                                                                               |      |
| <b>PP4</b>  | For UN 1774, packagings shall meet the packing group II performance level.                                                                                                                                                                       |      |
| <b>PP5</b>  | For UN 1204, packagings shall be so constructed that explosion is not possible by reason of increased internal pressure. Gas cylinders and gas receptacles shall not be used for these substances.                                               |      |
| <b>PP10</b> | For UN 1791, packing group II, the packaging shall be vented.                                                                                                                                                                                    |      |
| <b>PP31</b> | For UN 1131, packagings shall be hermetically sealed.                                                                                                                                                                                            |      |
| <b>PP33</b> | For UN 1308, packing groups I and II, only combination packagings with a maximum gross mass of 75 kg are allowed.                                                                                                                                |      |
| <b>PP81</b> | For UN 1790 with more than 60 % but not more than 85 % hydrogen fluoride and UN 2031 with more than 55 % nitric acid, the permitted use of plastics, drums and jerricans as single packagings shall be two years from their date of manufacture. |      |
| <b>PP93</b> | For UN Nos. 3532 and 3534, packagings shall be designed and constructed to permit the release of gas or vapour to prevent a build-up of pressure that could rupture the packagings in the event of loss of stabilization.                        |      |

|             | formance tests in Chapter 6.1.                                                                                                                                                                                                                                              |      |
| <b>PP15</b> | For UN 1324 and UN 2623, packagings shall meet the packing group III performance level.                                                                                                                                                                                     |      |
| <b>PP20</b> | For UN 2217, any siftproof, tearproof receptacle may be used.                                                                                                                                                                                                               |      |
| <b>PP30</b> | For UN 2471, paper or fibre inner packagings are not permitted.                                                                                                                                                                                                             |      |
| <b>PP34</b> | For UN 2969 (as whole beans), 5H1, 5L1 and 5M1 bags are permitted.                                                                                                                                                                                                          |      |
| <b>PP37</b> | For UN 2590 and UN 2212, 5M1 bags are permitted. All bags of any type must be transported in closed cargo transport units or be placed in closed rigid overpacks.                                                                                                           |      |
| <b>PP38</b> | For UN 1309, packaging group II, bags are permitted only in closed cargo transport units.                                                                                                                                                                                   |      |
| <b>PP84</b> | For UN 1057, rigid outer packagings meeting the packaging group II performance level must be used. The packagings must be designed and constructed and arranged to prevent movement, inadvertent ignition of the devices or inadvertent release of flammable gas or liquid. |      |
| <b>PP85</b> | For UN Nos. 1748, 2208, 2880, 3485, 3486 and 3487, if bags are used as single packagings they should be adequately separated to allow for the dissipation of heat. For transport by sea, bags are not allowed as single packagings.                                         |      |
| <b>PP92</b> | For UN Nos. 3531 and 3533, packagings must be designed and constructed to permit the release of gas or vapour to prevent a build-up of pressure that could rupture the packagings in the event of loss of stabilization.                                                    |      |

| P003                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | PACKING INSTRUCTION                                                                                                                                                      | P003 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| Dangerous goods must be placed in suitable outer packagings. The packagings must meet the provisions of <b>4.1.1.1</b> , <b>4.1.1.2</b> , <b>4.1.1.4</b> , <b>4.1.1.8</b> and <b>4.1.3</b> and be so designed that they meet the construction requirements of <b>6.1.4</b> . Outer packagings constructed of suitable material, and of adequate strength and design in relation to the packaging capacity and its intended use, must be used. Where this packing instruction is used for the transport of articles or inner packagings of combination packagings the packaging must be designed and constructed to prevent inadvertent discharge of articles during normal conditions of transport. |                                                                                                                                                                          |      |
| <b>Special packing provisions:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                          |      |

| <b>Note:</b> The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                          |      |

| <b>P003</b> | <b>PACKING INSTRUCTION</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>P003</b> |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <b>PP90</b> | For UN Nos. 3506 and 3554, sealed inner liners or bags of strong leak-proof and puncture resistant material impervious to mercury or gallium, as appropriate, which will prevent escape of the substance from the package irrespective of the position of the package must be used. For air transport additional requirements may apply.                                                                                                                                                                             |             |
| <b>PP91</b> | For UN 1044, large fire extinguishers may also be transported unpackaged provided that the requirements of 4.1.3.8 (a) to (e) are met, the valves are protected by one of the methods in accordance with 4.1.6.1.8 (a) to (d) and other equipment mounted on the fire extinguisher is protected to prevent accidental activation. For the purpose of this special packing provision, "large fire extinguishers" means fire extinguishers as described in indents (c) to (e) of special provision 225 of Chapter 3.3. |             |
| <b>PP96</b> | For UN 2037 waste gas cartridges carried in accordance with special provision 327, the packagings shall be adequately ventilated to prevent the creation of dangerous atmospheres and the build-up of pressure.                                                                                                                                                                                                                                                                                                      |             |

| This instruction applies to UN Nos. 3528, 3529 and 3530.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                     |      |
| <p>If the engine or machinery is constructed and designed so that the means of containment containing the dangerous goods affords adequate protection, an outer packaging is not required.</p> <p>Dangerous goods in engines or machinery must otherwise be packed in outer packagings constructed of suitable material, and of adequate strength and design in relation to the packaging capacity and its intended use, and meeting the applicable requirements of 4.1.1.1, or they must be fixed in such a way that they will not become loose during normal conditions of transport, e.g. in cradles or crates or other handling devices.</p> <p><b>NOTE:</b> <i>The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3).</i></p> <p>In addition, the manner in which means of containment are contained within the engine or machinery, must be such that under normal conditions of transport, damage to the means of containment containing the dangerous goods is prevented; and in the event of damage to the means of containment containing liquid dangerous goods, no leakage of the dangerous goods from the engine or machinery is possible (a leakproof liner may be used to satisfy this requirement).</p> <p>Means of containment containing dangerous goods must be so installed, secured or cushioned as to prevent their breakage or leakage and so as to control their movement within the engine or machinery during normal conditions of transport. Cushioning material must not react dangerously with the content of the means of containment. Any leakage of the contents must not substantially impair the protective properties of the cushioning material.</p> |                     |      |
| <p><b>Additional requirement:</b></p> <p>Other dangerous goods (e.g. batteries, fire extinguishers, compressed gas accumulators or safety devices) required for the functioning or safe operation of the engine or machinery must be securely mounted in the engine or machine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                     |      |

| P006                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | PACKING INSTRUCTION | P006 |

|      | <p>ported unpackaged or on pallets when the dangerous goods are afforded equivalent protection by the article in which they are contained.</p> <p><b>Note:</b> <i>The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3).</i></p> <p>(3) Additionally, the following conditions must be met:</p> <ul style="list-style-type: none"> <li>(a) Receptacles within articles containing liquids or solids must be constructed of suitable materials and secured in the article in such a way that, under normal conditions of transport, they cannot break, be punctured or leak their contents into the article itself or the outer packaging;</li> <li>(b) Receptacles containing liquids with closures must be packed with their closures correctly oriented. The receptacles must in addition conform to the internal pressure test provisions of 6.1.5.5;</li> <li>(c) Receptacles that are liable to break or be punctured easily, such as those made of glass, porcelain or stoneware or of certain plastics materials must be properly secured. Any leakage of the contents must not substantially impair the protective properties of the article or of the outer packaging;</li> <li>(d) Receptacles within articles containing gases must meet the requirements of Section 4.1.6 and Chapter 6.2 as appropriate or be capable of providing an equivalent level of protection as packing instructions P200 or P208;</li> <li>(e) Where there is no receptacle within the article, the article must fully enclose the dangerous substances and prevent their release under normal conditions of transport.</li> </ul> <p>(4) Articles must be packed to prevent movement and inadvertent operation during normal conditions of transport.</p> <p>(5) Articles containing pre-production prototype lithium cells or batteries when these prototypes are transported for testing or production runs of not more than 100 lithium cells or batteries that are of a type that have not met the testing requirements of the Manual of Tests and Criteria, part III, sub-section 38.3 shall in addition meet the following:</p> <ul style="list-style-type: none"> <li>(a) Packagings shall conform to the requirements in paragraph (1) of this packing instruction;</li> <li>(b) Appropriate measures shall be taken to minimize the effects of vibration and shocks and prevent movement of the article within the package that may lead to damage and a dangerous condition during transport. When cushioning material is used to meet this requirement it shall be non-combustible and electrically non-conductive;</li> <li>(c) Non-combustibility of the cushioning material shall be assessed according to a standard recognised in the country where the packaging is designed or manufactured;</li> <li>(d) The article may be transported unpackaged under conditions specified by the competent authority. Additional conditions that may be considered in the approval process include, but are not limited to: <ul style="list-style-type: none"> <li>(i) The article shall be strong enough to withstand the shocks and loadings normally encountered during transport, including trans-shipment between cargo transport units and between cargo transport units and warehouses as well as any removal from a pallet for subsequent manual or mechanical handling; and</li> <li>(ii) The article shall be fixed in cradles or crates or other handling devices in such a way that it will not become loose during normal conditions of transport.</li> </ul> </li> </ul> |      |

| <b>Special packing provisions:</b><br><b>PP45</b> For UN 0144, intermediate packagings are not required.<br><b>PP53</b> For UN Nos. 0075, 0143, 0495 and 0497, when boxes are used as the outer packaging, inner packagings must have taped screw cap closures and be not more than 5 litres capacity each. Inner packagings must be surrounded with non-combustible absorbent cushioning materials. The amount of absorbent cushioning material must be sufficient to absorb the liquid contents. Metal receptacles must be cushioned from each other. Net mass of propellant is limited to 30 kg for each package when outer packagings are boxes.<br><b>PP54</b> For UN Nos. 0075, 0143, 0495 and 0497, when drums are used as the outer packaging and when intermediate packagings are drums, they must be surrounded with non-combustible cushioning material in a quantity sufficient to absorb the liquid contents. A composite packaging consisting of a plastic receptacle in a metal drum may be used instead of the inner and intermediate packagings. The net volume of propellant in each package must not exceed 120 litres.<br><b>PP55</b> For UN 0144, absorbent cushioning material must be inserted.<br><b>PP56</b> For UN 0144, metal receptacles may be used as inner packagings.<br><b>PP57</b> For UN Nos. 0075, 0143, 0495 and 0497, bags must be used as intermediate packagings when boxes are used as outer packagings.<br><b>PP58</b> For UN Nos. 0075, 0143, 0495 and 0497, drums must be used as intermediate packagings when drums are used as outer packagings.<br><b>PP59</b> For UN 0144, fibreboard boxes (4G) may be used as outer packagings.<br><b>PP60</b> For UN 0144, aluminium drums (1B1 and 1B2) and metal, other than steel or alu- |                                                                                                             |                                                                                                                                                                                                                                                                                    |

| <b>PP67</b>                        | <p>The following applies to UN Nos. 0006, 0009, 0010, 0015, 0016, 0018, 0019, 0034, 0035, 0038, 0039, 0048, 0056, 0137, 0138, 0168, 0169, 0171, 0181, 0182, 0183, 0186, 0221, 0243, 0244, 0245, 0246, 0254, 0280, 0281, 0286, 0287, 0297, 0299, 0300, 0301, 0303, 0321, 0328, 0329, 0344, 0345, 0346, 0347, 0362, 0363, 0370, 0412, 0424, 0425, 0434, 0435, 0436, 0437, 0438, 0451, 0488, 0502 and 0510: Large and robust explosives articles, normally intended for military use, without their means of initiation or with their means of initiation containing at least two effective protective features, may be carried unpackaged. When such articles have propelling charges or are self-propelled, their ignition systems must be protected against stimuli encountered during normal conditions of transport. A negative result in test series 4 on an unpackaged article indicates that the article can be considered for transport unpackaged. Such unpackaged articles may be fixed to cradles or contained in crates or other suitable handling devices.</p> <p><b>NOTE:</b> The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3)</p> |      |

| <b>Special packing provisions:</b><br><b>PP70</b> For UN Nos. 0059, 0439, 0440 and 0441, when the shaped charges are packed singly, the conical cavity must face downwards and the package must be marked as illustrated in figures 5.2.3 or 5.2.4. When the shaped charges are packed in pairs, the conical cavities must face inwards to minimise the jetting effect in the event of accidental initiation. |  |                                                                                                                                                                          |

|      | <p>a: Aluminium alloy pressure receptacles must not be used.</p> <p>b: Copper valves must not be used:</p> <p>c: Metal parts in contact with the contents must not contain more than 65% copper.</p> <p>d: When steel pressure receptacles or composite pressure receptacles with steel liners are used, only those bearing the "H" mark in accordance with 6.2.2.7.4 (p) are permitted:</p> <p><i>Requirements for toxic substances with an LC<sub>50</sub> less than or equal to 200 ml/m<sup>3</sup> (ppm)</i></p> <p>k: Valve outlets must be fitted with pressure retaining gas-tight plugs or caps having threads that match those of the valves outlets.</p> <p>Each cylinder within a bundle must be fitted with an individual valve that must be closed during transport. After filling, the manifold must be evacuated, purged and plugged.</p> <p>Bundles containing UN 1045 Fluorine, compressed, may be constructed with isolation valves on groups of cylinders not exceeding 150 litres total water capacity instead of isolation valves on every cylinder.</p> <p>Cylinders and individual cylinders in a bundle must have a test pressure greater than or equal to 200 bar and a minimum wall thickness of 3.5 mm for aluminium alloy or 2 mm for steel. Individual cylinders not complying with this requirement must be transported in a rigid outer packaging that will adequately protect the cylinder and its fittings and meeting the packing group I performance level. Pressure drums must have a minimum wall thickness as specified by the competent authority.</p> <p>Pressure receptacles must not be fitted with a pressure relief device.</p> <p>Cylinders and individual cylinders in a bundle must be limited to a maximum water capacity of 85 litres.</p> <p>Each valve must be capable of withstanding the test pressure of the pressure receptacle and be connected directly to the pressure receptacle by either a taper thread or other means which meets the requirements of ISO 10692-2:2001.</p> <p>Each valve must either be of the packless type with non-perforated diaphragm, or be of a type which prevents leakage through or past the packing.</p> <p>Each pressure receptacle must be tested for leakage after filling.</p> <p><i>Gas specific provisions</i></p> <p>l: UN 1040 ethylene oxide may also be packed in hermetically sealed glass or metal inner packagings suitably cushioned in fibreboard, wooden or metal boxes meeting the packing group I performance level. The maximum quantity permitted in any glass inner packaging is 30 g, and the maximum quantity permitted in any metal inner packaging is 200 g. After filling, each inner packaging must be determined to be leak-tight by placing the inner packaging in a hot water bath at a temperature, and for a period of time, sufficient to ensure that an internal pressure equal to the vapour pressure of ethylene oxide at 55 °C is achieved. The maximum net mass in any outer packaging must not exceed 2.5 kg.</p> <p>m: Pressure receptacles must be filled to a working pressure not exceeding 5 bar.</p> |      |

| P200                | PACKING INSTRUCTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | P200 |

| n:                  | Cylinders and individual cylinders in a bundle must contain not more than 5 kg of the gas. When bundles containing UN 1045 Fluorine, compressed, are divided into groups of cylinders in accordance with special packing provision “k”, each group must contain not more than 5 kg of the gas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |      |
| o:                  | In no case must the working pressure or filling ratio shown in the table be exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |      |
| p:                  | <p>For UN 1001 acetylene, dissolved and UN 3374 acetylene, solvent free: cylinders must be filled with a homogeneous monolithic porous material; the working pressure and the quantity of acetylene must not exceed the values prescribed in the approval or in ISO 3807-1:2000, ISO 3807-2:2000, ISO 3807:2013 or AS 2030.2, as applicable.</p> <p>For UN 1001 acetylene, dissolved: cylinders must contain a quantity of acetone or suitable solvent as specified in the approval (see ISO 3807-1:2000, ISO 3807-2:2000, ISO 3807-2:2013 or AS 2030.2, as applicable); cylinders fitted with pressure relief devices or manifolded together must be transported vertically.</p> <p>The test pressure of 52 bar applies only to cylinders fitted with a fusible plug.</p> |      |
| q:                  | Valve outlets of pressure receptacles for pyrophoric gases or flammable mixtures of gases containing more than 1% of pyrophoric compounds must be fitted with gas-tight plugs or caps. When these pressure receptacles are manifolded in a bundle, each of the pressure receptacles must be fitted with an individual valve that must be closed during transport, and the outlet of the manifold valve must be fitted with a pressure retaining gas-tight plug or cap. Gas-tight plugs or caps must have threads that match those of the valves outlets.                                                                                                                                                                                                                   |      |
| r:                  | The filling ratio of this gas must be limited such that, if complete decomposition occurs, the pressure does not exceed two thirds of the test pressure of the pressure receptacle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |      |

|      | <p>the filling temperature and at a pressure of 100 kPa (1 bar) must not exceed 98% of the water capacity of the pressure receptacle.</p> <p>For flammable refrigerated liquefied gases the gas filled into the receptacle must remain below the level at which, if the contents were raised to the temperature at which the vapour pressure equalled the opening pressure of the relief valve, the volume of the liquid phase would reach 98% of the water capacity at that temperature.</p> <p>(6) Pressure-relief devices<br/>Closed cryogenic receptacles must be fitted with at least one pressure-relief device.</p> <p>(7) Compatibility<br/>Materials used to ensure the leakproofness of the joints or for the maintenance of the closures must be compatible with the contents. In the case of receptacles intended for the transport of oxidising gases, (i.e. with a subsidiary hazard of 5.1) these materials must not react with these gases in a dangerous manner.</p> <p>(8) Periodic inspection<br/>The periodic inspection and test frequencies of pressure relief valves in accordance with 6.2.1.6.3 must not exceed five years.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |      |
|      | <p><b>Requirements for open cryogenic receptacles:</b></p> <p>Only the following non oxidising refrigerated liquefied gases of Division 2.2 may be transported in open cryogenic receptacles: UN Nos. 1913, 1951, 1963, 1970, 1977, 2591, 3136 and 3158. For these gases, when used as a coolant the requirements of 5.5.3 shall apply.</p> <p>Open cryogenic receptacles must be constructed to meet the following requirements:</p> <ol style="list-style-type: none"> <li>(1) The receptacles must be designed, manufactured, tested and equipped in such a way as to withstand all conditions, including fatigue, to which they will be subjected during their normal use and during normal conditions of transport.</li> <li>(2) The capacity must be not more than 450 litres.</li> <li>(3) The receptacle must have a double wall construction with the space between the inner and outer wall being evacuated (vacuum insulation). The insulation must prevent the formation of hoar frost on the exterior of the receptacle.</li> <li>(4) The materials of construction must have suitable mechanical properties at the service temperature.</li> <li>(5) Materials which are in direct contact with the dangerous goods must not be affected or weakened by the dangerous goods intended to be transported and must not cause a dangerous effect, e.g. catalysing a reaction or reacting with the dangerous goods.</li> <li>(6) Receptacles of glass double wall construction must have an outer packaging with suitable cushioning or absorbent materials which withstand the pressures and impacts liable to occur under normal conditions of transport.</li> <li>(7) The receptacle must be designed to remain in an upright position during transport e.g. have a base whose smaller horizontal dimension is greater than the height of the centre of gravity when filled to capacity or be mounted on gimbals.</li> <li>(8) The openings of the receptacles must be fitted with devices allowing gases to escape, preventing any splashing out of liquid, and so configured that they remain in place during transport.</li> </ol> |      |

| <b>P203</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>PACKING INSTRUCTION</b> | <b>P203</b> |

| <b>PP87</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | For UN 1950 waste aerosols transported in accordance with special provision 327, the packagings must have a means of retaining any free liquid that might escape during transport, e.g. absorbent material. The packaging must be adequately ventilated to prevent the creation of dangerous atmospheres and the build-up of pressure. |             |

| <b>P208</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>PACKING INSTRUCTIONS</b> | <b>P208</b> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-------------|
| This instruction applies to Class 2 adsorbed gases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                             |             |
| <p>(1) The following packagings are authorized provided the general packing requirements of <b>4.1.6.1</b> are met:</p> <p>(a) Cylinders constructed as specified in 6.2.2 and in accordance with ISO 11513:2011, ISO 11513:2019, ISO 9809-1:2010 or ISO 9809-1:2019; and</p> <p>(b) Cylinders constructed before 1 January 2016 in accordance with 6.2.3 and a specification approved by the competent authorities of the countries of transport and use.</p> <p>(2) The pressure of each filled cylinder must be less than 101.3 kPa at 20°C and less than 300 kPa at 50°C.</p> <p>(3) The minimum test pressure of the cylinder must be 21 bar.</p> <p>(4) The minimum burst pressure of the cylinder must be 94.5 bar.</p> <p>(5) The internal pressure at 65°C of the filled cylinder must not exceed the test pressure of the cylinder.</p> <p>(6) The adsorbent material must be compatible with the cylinder and must not form harmful or dangerous compounds with the gas to be adsorbed. The gas in combination with the adsorbent material must not affect or weaken the cylinder or cause a dangerous reaction (e.g. a catalyzing reaction).</p> <p>(7) The quality of the adsorbent must be verified at the time of each fill to assure the pressure and chemical stability requirements of this packing instruction are met each time an adsorbed gas package is offered for transport.</p> |                             |             |

- (8) The adsorbent material must not meet the criteria of any of the Classes or Divisions in this Code.
- (9) Requirements for cylinders and closures containing toxic gases with an LC<sub>50</sub> less than or equal to 200 ml/m<sup>3</sup> (ppm) (see table 1) must be as follows:
- (a) Valve outlets must be fitted with pressure retaining gas-tight plugs or caps having threads matching those of the valve outlets.
  - (b) Each valve must either be of the packless type with non-perforated diaphragm, or be of a type which prevents leakage through or past the packing.
  - (c) Each cylinder and closure must be tested for leakage after filling.
  - (d) Each valve must be capable of withstanding the test pressure of the cylinder and be directly connected to the cylinder by either a taper-thread or other means which meets the requirements of ISO 10692-2:2001.
  - (e) Cylinders and valves must not be fitted with a pressure relief device.
- (10) Valve outlets for cylinders containing pyrophoric gases must be fitted with gas-tight plugs or caps having threads matching those of the valve outlets.
- (11) The filling procedure must be in accordance with annex A of ISO 11513:2011 (applicable until 31 December 2024) or annex A of ISO 11513:2019.
- (12) The maximum period for periodic inspections must be 5 years.
- (13) Special packing provisions that are specific to a substance (see table 1).

*Material compatibility*

a: Aluminium alloy cylinders must not be used.

d: When steel cylinders are used, only those bearing the "H" mark in accordance with 6.2.2.7.4 (p) are permitted.

*Gas specific provisions*

r: The filling of this gas must be limited such that, if complete decomposition occurs, the pressure does not exceed two thirds of the test pressure of the cylinder.

*Material compatibility for n.o.s. adsorbed gas entries*

z: The construction materials of the cylinders and their accessories must be compatible with the contents and must not react to form harmful or dangerous compounds.

**Table 1: ADSORBED GASES**

| UN No. | Name and description                   | Class or Division | Subsidiary hazard | LC <sub>50</sub> ml/m <sup>3</sup> | Special packing provisions |
