| This instruction applies to UN Nos. 2814 and 2900.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                            |             |
| <p>The following packagings are authorised provided that the special packing provisions of <b>4.1.8</b> are met:</p> <p>Packagings meeting the requirements of chapter 6.3 and approved accordingly consisting of:</p> <ol style="list-style-type: none"> <li>(a) Inner packagings comprising: <ol style="list-style-type: none"> <li>(i) leakproof primary receptacle(s);</li> <li>(ii) a leakproof secondary packaging;</li> <li>(iii) other than for solid infectious substances, an absorbent material in sufficient quantity to absorb the entire contents placed between the primary receptacle(s) and the secondary packaging; if multiple primary receptacles are placed in a single secondary packaging, they must be either individually wrapped or separated so as to prevent contact between them;</li> </ol> </li> <li>(b) A rigid outer packaging: <p>Drums (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);</p> <p>Boxes (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p>Jerricans (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).</p> <p>The smallest external dimension must be not less than 100 mm.</p> </li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                            |             |
| <p><b>Additional requirements:</b></p> <ol style="list-style-type: none"> <li>1. Inner packagings containing infectious substances must not be consolidated with inner packagings containing unrelated types of goods. Complete packages may be overpacked in accordance with the provisions of 1.2.1 and 5.1.2: such an overpack may contain dry ice. When dry ice or other refrigerants presenting a risk of asphyxiation are used as a coolant, the requirements of 5.5.3 shall apply.</li> <li>2. Other than for exceptional consignments, e.g. whole organs which require special packing, the following additional requirements must apply: <ol style="list-style-type: none"> <li>(a) Substances consigned at ambient temperatures or at a higher temperature. Primary receptacles must be of glass, metal or plastics. Positive means of ensuring a leak-proof seal must be provided, e.g. a heat seal, a skirted stopper or a metal crimp seal. If screw caps are used, they must be secured by positive means, e.g., tape, paraffin sealing tape or manufactured locking closure;</li> <li>(b) Substances consigned refrigerated or frozen. Ice, dry ice or other refrigerant must be placed around the secondary packaging(s) or alternatively in an overpack with one or more complete packages marked in accordance with 6.3.3. Interior supports must be provided to secure secondary packaging(s) or packages in position after the ice or dry ice has dissipated. When dry ice or other refrigerants presenting a risk of asphyxiation are used as a coolant, the requirements of 5.5.3 shall apply. If ice is</li> </ol> </li> </ol> |                            |             |

| P620                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | PACKING INSTRUCTION | P620 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|------|
| <p>used, the outer packaging or overpack must be leakproof. If dry ice is used, the outer packaging or overpack must permit the release of carbon dioxide gas. The primary receptacle and the secondary packaging must maintain their integrity at the temperature of the refrigerant used;</p> <p>(c) Substances consigned in liquid nitrogen. When liquid nitrogen is used as a coolant, the requirements of 5.5.3 shall apply. Plastics primary receptacles capable of withstanding very low temperature must be used. The secondary packaging must also be capable of withstanding very low temperatures, and in most cases will need to be fitted over the primary receptacle individually. Provisions for the consignment of liquid nitrogen must also be fulfilled. The primary receptacle and the secondary packaging must maintain their integrity at the temperature of the liquid nitrogen;</p> <p>(d) Lyophilised substances may also be transported in primary receptacles that are flame-sealed glass ampoules or rubber-stoppered glass vials fitted with metal seals.</p> <p>3. Whatever the intended temperature of the consignment, the primary receptacle or the secondary packaging must be capable of withstanding without leakage an internal pressure producing a pressure differential of not less than 95 kPa. This primary receptacle or secondary packaging shall also be capable of withstanding temperatures in the range -40 °C to +55 °C.</p> <p>4. Other dangerous goods must not be packed in the same packaging as Division 6.2 infectious substances unless they are necessary for maintaining the viability, stabilising or preventing degradation or neutralising the hazards of the infectious substances. A quantity of 30 ml or less of dangerous goods included in Classes 3, 8 or 9 may be packed in each primary receptacle containing infectious substances. These small quantities of dangerous goods of Classes 3, 8 or 9 are not subject to any additional requirements of this Code when packed in accordance with this packing instruction.</p> <p>5. Alternative packagings for the transport of animal material may be authorised by the competent authority in accordance with the provisions of 4.1.3.7.</p> |                     |      |

| P621                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | PACKING INSTRUCTION | P621 |

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|-------------|
| <p>This instruction applies to UN No. 3373.</p> <ol style="list-style-type: none"> <li>(1) The packaging must be of good quality, strong enough to withstand the shocks and loadings normally encountered during transport, including transshipment between cargo transport units and between cargo transport units and warehouses as well as any removal from a pallet or overpack for subsequent manual or mechanical handling. Packagings must be constructed and closed to prevent any loss of contents that might be caused under normal conditions of transport by vibration or by changes in temperature, humidity or pressure.</li> <li>(2) The packaging must consist of at least three components: <ol style="list-style-type: none"> <li>(a) a primary receptacle;</li> <li>(b) a secondary packaging; and</li> <li>(c) an outer packaging</li> </ol> of which either the secondary or the outer packaging must be rigid. </li> <li>(3) Primary receptacles must be packed in secondary packagings in such a way that, under normal conditions of transport, they cannot break, be punctured or leak their contents into the secondary packaging. Secondary packagings must be secured in outer packagings with suitable cushioning material. Any leakage of the contents must not compromise the integrity of the cushioning material or of the outer packaging.</li> <li>(4) For transport, the mark illustrated below must be displayed on the external surface of the outer packaging on a background of a contrasting colour and must be clearly visible and legible. The mark must be in the form of a square set at an angle of 45° (diamond-shaped) with each side have a length of at least 50 mm, the width of the line must be at least 2 mm; the letters and numbers must be at least 6 mm high. The proper shipping name "BIOLOGICAL SUBSTANCE, CATEGORY B" in letters at least 6 mm high must be</li> </ol> |                            |             |

marked on the outer packaging adjacent to the diamond-shaped mark.

- (5) At least one surface of the outer packaging must have a minimum dimension of 100 mm X 100 mm.
- (6) The completed package must be capable of withstanding a 1.2 m drop in any orientation without leakage from the primary receptacle(s) which must remain protected by absorbent material, when required, in the secondary packaging.

**NOTE:** Capability may be demonstrated by testing, assessment or experience.

- (7) For liquid substances

- (a) The primary receptacle(s) must be leakproof;
- (b) The secondary packaging must be leakproof;
- (c) If multiple fragile primary receptacles are placed in a single secondary packaging, they must be either individually wrapped or separated to prevent contact between them;
- (d) Absorbent material must be placed between the primary receptacle(s) and the secondary packaging. The absorbent material must be in quantity sufficient to absorb the entire contents of the primary receptacle(s) so that any release of the liquid substance will not compromise the integrity of the cushioning material or of the outer packaging; and
- (e) The primary receptacle or the secondary packaging must be capable of withstanding, without leakage, an internal pressure of 95 kPa (0.95 bar).

**NOTE:** Capability may be demonstrated by testing, assessment or experience.

- (8) For solid substances

- (a) The primary receptacle(s) must be siftproof;
- (b) The secondary packaging must be siftproof;
- (c) If multiple fragile primary receptacles are placed in a single secondary packaging, they must be either individually wrapped or separated to prevent contact between them; and
- (d) If there is any doubt as to whether or not residual liquid may be present in the primary receptacle during transport then a packaging suitable for liquids, including absorbent materials, must be used.

- (9) Refrigerated or frozen specimens: Ice, dry ice and liquid nitrogen

- (a) When dry ice or liquid nitrogen is used as a coolant, the requirements of 5.5.3 apply.

| P650 | PACKING INSTRUCTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | P650 |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
|      | <p>When used, ice must be placed outside the secondary packagings or in the outer packaging or an overpack. Interior supports must be provided to secure the secondary packagings in the original position. If ice is used, the outside packaging or overpack must be leakproof; and</p> <p>(b) The primary receptacle and the secondary packaging must maintain their integrity at the temperature of the refrigerant used as well as the temperatures and the pressures which could result if refrigeration were lost.</p> <p>(10) When packages are placed in an overpack, the package marks required by this packing instruction must either be clearly visible or be reproduced on the outside of the overpack.</p> <p>(11) Infectious substances assigned to UN 3373 which are packed and marked in accordance with this packing instruction are not subject to any other requirement in this Code.</p> <p>(12) Clear instructions on filling and closing such packages must be provided by packaging manufacturers and subsequent distributors to the consignor or to the person who prepares the package (e.g. patient) to enable the package to be correctly prepared for transport.</p> <p>(13) Other dangerous goods must not be packed in the same packaging as Division 6.2 infectious substances unless they are necessary for maintaining the viability, stabilising or preventing degradation or neutralising the hazards of the infectious substances. A quantity of 30 ml or less of dangerous goods included in Classes 3, 8 or 9 may be packed in each primary receptacle containing infectious substances. When these small quantities of dangerous goods are packed with infectious substances in accordance with this packing instruction no other requirements in this Code need be met.</p> |      |
|      | <p><b>Additional requirement:</b></p> <p>Alternative packagings for the transport of animal material may be authorised by the competent authority in accordance with the provisions of 4.1.3.7.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |      |

| <b>PP41</b>                       | <p>For UN 2803, when it is necessary to transport Gallium at low temperatures in order to maintain it in a completely solid state, the above packagings may be overpacked in a strong, water-resistant outer packaging which contains dry ice or other means of refrigeration. When dry ice or other means of refrigeration presenting a risk of asphyxiation are used as a coolant, the requirements of 5.5.3 shall apply. If a refrigerant is used, all of the above materials used in the packaging of gallium must be chemically and physically resistant to the refrigerant and must have impact resistance at the low temperatures of the refrigerant employed. If dry ice is used, the outer packaging must permit the release of carbon dioxide gas. Interior supports shall be provided to prevent movement after the dissipation of the refrigerant.</p> |        |

| <p>The following packagings are authorised:</p> <p>(1) Packagings meeting the provisions of 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.8 and 4.1.3 and so designed that they meet the construction requirements of 6.1.4. Outer packagings constructed of suitable material, and of adequate strength and design in relation to the packaging capacity and its intended use, must be used. Where this packing instruction is used for the transport of inner packagings of combination packagings the packaging must be designed and constructed to prevent inadvertent discharge during normal conditions of transport.</p> <p>(2) Packagings, which need not conform to the packaging test requirements of part 6, but conforming to the following:</p> <p>(a) An inner packaging comprising:</p> <ul style="list-style-type: none"> <li>(i) primary receptacle(s) and a secondary packaging, the primary receptacle(s) or the secondary packaging must be leakproof for liquids or siftproof for solids;</li> <li>(ii) for liquids, absorbent material placed between the primary receptacle(s) and the secondary packaging. The absorbent material must be in a quantity sufficient to absorb the entire contents of the primary receptacle(s) so that any release of the liquid substance will not compromise the integrity of the cushioning material or of the outer packaging;</li> <li>(iii) if multiple fragile primary receptacles are placed in a single secondary packaging they must be individually wrapped or separated to prevent contact between them;</li> </ul> |                     |      |

| P904                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | PACKING INSTRUCTION | P904 |

| <p>(b) An outer packaging must be strong enough for its capacity, mass and intended use, and with a smallest external dimension of at least 100 mm.</p> <p>For transport, the mark illustrated below must be displayed on the external surface of the outer packaging on a background of a contrasting colour and must be clearly visible and legible. The mark must be in the form of a square set at an angle of 45° (diamond-shaped) with each side having a length of at least 50 mm; the width of the line must be at least 2 mm and the letters and numbers must be at least 6 mm high.</p> |                     |      |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                     |      |
| <p><b>Additional requirement:</b></p> <p>When dry ice or liquid nitrogen is used as a coolant, the requirements of 5.5.3 apply. When used, ice must be placed outside the secondary packagings or in the outer packaging or an overpack. Interior supports must be provided to secure the secondary packaging in the original position. If ice is used, the outside packaging or overpack must be leakproof.</p>                                                                                                                                                                                  |                     |      |

| P905                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | PACKING INSTRUCTION | P905 |

| <p>The following packagings are authorised, provided that the general provisions of <b>4.1.1</b> and <b>4.1.3</b> are met:</p> <ol style="list-style-type: none"> <li>1. For liquids and solids containing or contaminated with PCBs, polyhalogenated biphenyls, polyhalogenated terphenyls or halogenated monomethyldiphenylmethanes: Packagings in accordance with P001 or P002, as appropriate.</li> <li>2. For transformers and condensers and other articles; <ol style="list-style-type: none"> <li>(a) Packagings in accordance with packing instructions P001 or P002. Articles must be secured with suitable cushioning material to prevent inadvertent movement during normal conditions of transport; or</li> <li>(b) Leakproof packagings which are capable of containing, in addition to the articles, at least 1.25 times the volume of the liquid PCBs, polyhalogenated biphenyls, polyhalogenated terphenyls or halogenated monomethyldiphenylmethanes present in them. There must be sufficient absorbent material in the packagings to absorb at least 1.1 times the volume of liquid which is contained in the articles. In general, transformers and condensers must be carried in leakproof metal packagings which are capable of holding, in addition to the transformers and condensers, at least 1.25 times the volume of the liquid present in them.</li> </ol> </li> </ol> <p><b>NOTE 1:</b> <i>The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3).</i></p> <p>Notwithstanding the above, liquids and solids not packaged in accordance with P001 and P002 and unpackaged transformers and condensers may be transported in cargo transport units fitted with a leakproof metal tray to a height of at least 800 mm, containing sufficient inert absorbent material to absorb at least 1.1 times the volume of any free liquid.</p> <p><b>NOTE 2:</b> <i>The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3)</i></p> |                     |      |
| <p><b>Additional requirement:</b></p> <p>Adequate provisions must be taken to seal the transformers and condensers to prevent leakage during normal conditions of transport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                     |      |

| P907                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | PACKING INSTRUCTION | P907 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|------|
| This instruction applies to articles such as machinery, apparatus or devices of UN 3363.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                     |      |
| <p>If the article is constructed and designed so that the receptacles containing the dangerous goods are afforded adequate protection, an outer packaging is not required. Dangerous goods in an article must otherwise be packed in outer packagings constructed of suitable material, and of adequate strength and design in relation to the packaging capacity and its intended use, and meeting the applicable requirements of 4.1.1.1.</p> <p>Receptacles containing dangerous goods must conform to the general provisions in 4.1.1, except that 4.1.1.3, 4.1.1.4, 4.1.1.12 and 4.1.1.14 do not apply. For Division 2.2 gases, the inner cylinder or receptacle, its contents and filling ratio must be to the satisfaction of the competent authority of the country in which the cylinder or receptacle is filled.</p> <p>In addition, the manner in which receptacles are contained within the article, must be such that under normal conditions of transport, damage to receptacles containing the dangerous goods is</p> |                     |      |

| P907                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | PACKING INSTRUCTION | P907 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|------|
| <p>unlikely; and in the event of damage to receptacles containing solid or liquid dangerous goods, no leakage of the dangerous goods from the article is possible (a leakproof liner may be used to satisfy this requirement). Receptacles containing dangerous goods must be so installed, secured or cushioned as to prevent their breakage or leakage and so as to control their movement within the article during normal conditions of transport.</p> <p>Cushioning material must not react dangerously with the content of the receptacles. Any leakage of the contents must not substantially impair the protective properties of the cushioning material.</p> <p><b>NOTE:</b> <i>The packagings authorised may exceed a net mass of 400 kg (see 4.1.3.3)</i></p> |                     |      |

| P908                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | PACKING INSTRUCTION | P908 |

| <p>This instruction applies to damaged or defective lithium ion cells and batteries and damaged or defective lithium metal cells and batteries, including those contained in equipment, of UN Nos. 3090, 3091, 3480, 3481, 3551 and 3552.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                     |      |
| <p>The following packagings are authorised, provided that the general provisions of <b>4.1.1</b> and <b>4.1.3</b> are met:</p> <p>For cells and batteries and equipment containing cells and batteries:</p> <p style="padding-left: 40px;">Drums (1A2, 1B2, 1N2, 1H2, 1D, 1G);</p> <p style="padding-left: 40px;">Boxes (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p style="padding-left: 40px;">Jerricans (3A2, 3B2, 3H2)</p> <p>The packagings must conform to the packing group II performance level.</p> <p>Packagings must also meet the following requirements:</p> <ol style="list-style-type: none"> <li>(a) Each damaged or defective cell or battery or equipment containing such cells or batteries must be individually packed in inner packaging and placed inside of an outer packaging. The inner packaging or outer packaging must be leak-proof to prevent the potential release of electrolyte.</li> <li>(b) Each inner packaging must be surrounded by sufficient non-combustible and electrically non-conductive thermal insulation material to protect against a dangerous evolution of heat.</li> <li>(c) Sealed packagings must be fitted with a venting device when appropriate.</li> <li>(d) Appropriate measures must be taken to minimize the effects of vibrations and shocks, prevent movement of the cells or batteries within the package that may lead to further damage and a dangerous condition during transport. Cushioning material that is non-combustible and electrically non-conductive may also be used to meet this requirement.</li> <li>(e) The non-combustibility of the thermal insulation material and the cushioning material must be assessed according to a standard recognised in the country where the packaging is designed or manufactured.</li> </ol> <p>For leaking cells or batteries, sufficient inert absorbent material must be added to the inner or outer packaging to absorb any release of electrolyte.</p> |                     |      |

| P908                                                                                                             | PACKING INSTRUCTION | P908 |
|------------------------------------------------------------------------------------------------------------------|---------------------|------|
| A cell or battery with a net mass of more than 30 kg must be limited to one cell or battery per outer packaging. |                     |      |
| <b>Additional requirement:</b><br>Cells and batteries must be protected against short circuit.                   |                     |      |

| P909                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | PACKING INSTRUCTION | P909 |

| a dangerous evolution of heat or a dangerous emission of toxic, corrosive or flammable gases or vapours under normal conditions of transport.                                                                                                                                                                                                                          |                     |      |
| The following packagings are authorised, provided that the general provisions of <b>4.1.1</b> and <b>4.1.3</b> are met:                                                                                                                                                                                                                                                |                     |      |
| For cells and batteries and equipment containing cells and batteries:                                                                                                                                                                                                                                                                                                  |                     |      |
| Drums (1A2, 1B2, 1N2, 1H2, 1D, 1G);                                                                                                                                                                                                                                                                                                                                    |                     |      |
| Boxes (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);                                                                                                                                                                                                                                                                                                                    |                     |      |
| Jerricans (3A2, 3B2, 3H2)                                                                                                                                                                                                                                                                                                                                              |                     |      |
| The packagings must conform to the packing group I performance level.                                                                                                                                                                                                                                                                                                  |                     |      |
| (1) The packaging must be capable of meeting the following additional performance requirements in case of rapid disassembly, dangerous reaction, production of a flame or a dangerous evolution of heat or a dangerous emission of toxic, corrosive or flammable gases or vapours of the cells or batteries:                                                           |                     |      |
| (a) The outside surface temperature of the completed package shall not have a temperature of more than 100°C. A momentary spike in temperature up to 200°C is acceptable;                                                                                                                                                                                              |                     |      |
| (b) No flame shall occur outside the package;                                                                                                                                                                                                                                                                                                                          |                     |      |
| (c) No projectiles shall exit the package;                                                                                                                                                                                                                                                                                                                             |                     |      |
| (d) The structural integrity of the package shall be maintained;                                                                                                                                                                                                                                                                                                       |                     |      |
| (e) The packagings shall have a gas management system (e.g. filter system, air circulation, containment for gas, gas tight packaging etc.), as appropriate.                                                                                                                                                                                                            |                     |      |
| (2) The additional packaging performance requirements shall be verified by a test as specified by the competent authority <sup>a</sup> .                                                                                                                                                                                                                               |                     |      |
| A verification report shall be available on request. As a minimum requirement, the cell or battery name, the cell or battery number, the mass, type, energy content of the cells or batteries, the packaging identification and the test data according to the verification method as specified by the competent authority shall be listed in the verification report. |                     |      |
| (3) When dry ice or liquid nitrogen is used as a coolant, the requirements of section 5.5.3 shall apply. The inner packaging and outer packaging shall maintain their integrity at the temperature of the refrigerant used as well as the temperatures and the pressures which could result if refrigeration were lost.                                                |                     |      |
| <b>Additional requirement:</b>                                                                                                                                                                                                                                                                                                                                         |                     |      |
| Cells or batteries must be protected against short circuit.                                                                                                                                                                                                                                                                                                            |                     |      |

| <b>B9</b>  | For UN 0082, this packing instruction may only be used when the substances are mixtures of ammonium nitrate or other inorganic nitrates with other combustible substances which are not explosive ingredients. Such explosives must not contain nitroglycerin, similar liquid organic nitrates, or chlorates. Metal IBCs are not authorised.                                                             |        |
| <b>B10</b> | For UN 0241, this packing instruction may only be used for substances which consist of water as an essential ingredient and high proportions of ammonium nitrate or other oxidising substances some or all of which are in solution. The other constituents may include hydrocarbons or aluminium powder, but must not include nitro-derivatives such as trinitrotoluene. Metal IBCs are not authorised. |        |
| <b>B17</b> | For UN No. 0222, metal IBCs are not authorised.                                                                                                                                                                                                                                                                                                                                                          |        |

| IBC520                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                 | PACKING INSTRUCTIONS |              |                           | IBC520              |                       |

**Additional requirements:**

1. IBCs must be provided with a device to allow venting during transport. The inlet to the pressure-relief device must be sited in the vapour space of the IBC under maximum filling conditions during transport.
2. To prevent explosive rupture of metal IBCs or composite IBCs with complete metal casing, the emergency-relief devices must be designed to vent all the decomposition products and vapours evolved during self-accelerating decomposition or during a period of not less than one hour of complete fire-engulfment as calculated by the formula in 4.2.1.13.8. The control and emergency temperatures specified in this packing instruction are based on a non-insulated IBC. When consigning an organic peroxide in an IBC in accordance with this instruction, it is the responsibility of the consignor to ensure that:
  - (a) the pressure and emergency relief devices installed on the IBC are designed to take appropriate account of the self-accelerating decomposition of the organic peroxide and of fire-engulfment; and
  - (b) when applicable, the control and emergency temperatures indicated are appropriate, taking into account the design (e.g. insulation) of the IBC to be used.

| <p>(4) The inner packaging and/or the intermediate packaging may be flexible. When flexible packagings are used, they must be capable of passing the impact resistance test of at least 165g according to ISO 7765-1:1988 “Plastics film and sheeting – Determination of impact resistance by the free-falling dart method – Part 1: Staircase methods” and the tear resistance test of at least 480g in both parallel and perpendicular planes with respect to the length of the bag in accordance with ISO 6383-2:1983 “Plastics – Film and sheeting – Determination of tear resistance – Part 2: Elmendorf method”. The maximum net mass of each flexible inner packaging must be 30kg.</p> <p>(5) Each flexible intermediate packaging must contain only one inner packaging.</p> <p>(6) Inner packagings containing a small amount of free liquid may be included in intermediate packaging provided that there is sufficient absorbent or solidifying material in the inner or intermediate packaging to absorb or solidify all the liquid content present. Suitable absorbent material which withstands the temperatures and vibrations liable to occur under normal conditions of transport must be used.</p> <p>(7) Intermediate packagings must be secured in outer packagings with suitable cushioning and/or absorbent material.</p> |                     |       |

|       | <p>Criteria, the maximum number of batteries, the total mass of batteries, the total energy content of the batteries, the large packaging identification and the test data according to the verification method as specified by the competent authority must be listed in the verification report. A set of specific instructions describing the way to use the package must also be part of the verification report.</p> <p>(3) When dry ice or liquid nitrogen is used as a coolant, the requirements of section 5.5.3 shall apply. The inner packaging and outer packaging shall maintain their integrity at the temperature of the refrigerant used as well as the temperatures and the pressures which could result if refrigeration were lost.</p> <p>(4) The specific instructions for use of the package must be made available by the packaging manufacturers and subsequent distributors to the consignor. They must include at least the identification of the batteries and items of equipment that may be contained inside the packaging, the maximum number of batteries contained in the package and the maximum total of the batteries energy content, as well as the configuration inside the package, including the separations and protections used during the performance verification test.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |
|       | <p><b>Additional requirement:</b></p> <p>Batteries must be protected against short circuit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |
|       | <p><b>Table Notes:</b></p> <p>a. <i>The following criteria, as relevant, may be considered to assess the performance of the large packaging:</i></p> <ul style="list-style-type: none"> <li>(a) <i>The assessment shall be done under a quality management system (as described e.g. in section 2.9.4 (e)) allowing for the traceability of tests results, reference data and characterization models used;</i></li> <li>(b) <i>The list of hazards expected in case of thermal runaway for the battery type, in the condition it is transported (e.g. usage of an inner packaging, state of charge (SOC), use of sufficient non-combustible, electrically non-conductive and absorbent cushioning material etc.), must be clearly identified and quantified; the reference list of possible hazards for batteries (e.g. rapidly disassemble, dangerously react, produce a flame or a dangerous evolution of heat or a dangerous emission of toxic, corrosive or flammable gases or vapours) can be used for this purpose. The quantification of these hazards shall rely on available scientific literature;</i></li> <li>(c) <i>The mitigating effects of the large packaging must be identified and characterized, based on the nature of the protections provided and the construction material properties. A list of technical characteristics and drawings must be used to support this assessment (density [<math>\text{kg}\cdot\text{m}^{-3}</math>], specific heat capacity [<math>\text{J}\cdot\text{kg}^{-1}\cdot\text{K}^{-1}</math>], heating value [<math>\text{kJ}\cdot\text{kg}^{-1}</math>], thermal conductivity [<math>\text{W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}</math>], melting temperature and flammability temperature [<math>\text{K}</math>], heat transfer coefficient of the outer packaging [<math>\text{W}\cdot\text{m}^{-2}\cdot\text{K}^{-1}</math>], ...);</i></li> <li>(d) <i>The test and any supporting calculations must assess the result of a thermal runaway of the battery inside the large packaging in the normal conditions of transport;</i></li> <li>(e) <i>In case the SOC of the battery is not known, the assessment used, must be done with the highest possible SOC corresponding to the battery use conditions;</i></li> <li>(f) <i>The surrounding conditions in which the large packaging may be used and transported must be described (including for possible consequences of gas or smoke emissions on the environment, such as ventilation or other methods) according to the gas management system of the large packaging;</i></li> </ul> |       |

| LP906 | PACKING INSTRUCTION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | LP906 |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
|       | <p>(g) <i>The tests or the model calculation must consider the worst case scenario for the thermal runaway triggering and propagation inside the battery: this scenario includes the worst possible failure in the normal transport condition, the maximum heat and flame emissions for the possible propagation of the reaction;</i></p> <p>(h) <i>These scenarios must be assessed over a period of time long enough to allow all possible consequences to occur (e.g. 24 hours).</i></p> <p>(i) <i>In the case of multiple batteries and multiple items of equipment containing batteries, additional requirements such as the maximum number of batteries and items of equipment, the total maximum energy content of the batteries, and the configuration inside the package, including separations and protections of the parts, must be considered.</i></p> |       |

#### 4.1.5 SPECIAL PACKING PROVISIONS FOR GOODS OF CLASS 1

**NOTE:** *These special provisions for Class 1 are included for information only.*

- 4.1.5.1 The general provisions of section 4.1.1 must be met.
- 4.1.5.2 All packagings for Class 1 goods must be so designed and constructed that:
- (a) They will protect the explosives, prevent them escaping and cause no increase in the risk of unintended ignition or initiation when subjected to normal conditions of transport including foreseeable changes in temperature, humidity and pressure;
  - (b) The complete package can be handled safely in normal conditions of transport; and
  - (c) The packages will withstand any loading imposed on them by foreseeable stacking to which they will be subject during transport so that they do not add to the risk presented by the explosives, the containment function of the packagings is not harmed, and they are not distorted in a way or to an extent which will reduce their strength or cause instability of a stack.
- 4.1.5.3 All explosive substances and articles, as prepared for transport, must have been classified in accordance with the procedures detailed in 2.1.3.
- 4.1.5.4 Class 1 goods must be packed in accordance with the appropriate packing instruction shown in Column 8 of the Dangerous Goods List, as detailed in 4.1.4.
- 4.1.5.5 Unless otherwise specified in this Code, packagings, including IBCs and large packagings, must conform to the requirements of chapters 6.1, 6.5 or 6.6, as appropriate, and must meet their test requirements for packing group II.
- 4.1.5.6 The closure device of packagings containing liquid explosives must ensure a double protection against leakage.

- 4.1.5.7 The closure device of metal drums must include a suitable gasket; if a closure device includes a screw-thread, the ingress of explosive substances into the screw-thread must be prevented.
- 4.1.5.8 Packagings for water soluble substances must be water-resistant. Packagings for desensitised or phlegmatised substances must be closed to prevent changes in concentration during transport.
- 4.1.5.9 When the packaging includes a double envelope filled with water which may freeze during transport, a sufficient quantity of an anti-freeze agent must be added to the water to prevent freezing. Anti-freeze that could create a fire hazard because of its inherent flammability must not be used.
- 4.1.5.10 Nails, staples and other closure devices made of metal without protective covering must not penetrate to the inside of the outer packaging unless the inner packaging adequately protects the explosives against contact with the metal.
- 4.1.5.11 Inner packagings, fittings and cushioning materials and the placing of explosive substances or articles in packages must be accomplished in a manner which prevents the explosive substances or articles from becoming loose in the outer packaging under normal conditions of transport. Metallic components of articles must be prevented from making contact with metal packagings. Articles containing explosive substances not enclosed in an outer casing must be separated from each other in order to prevent friction and impact. Padding, trays, partitioning in the inner or outer packaging, mouldings or receptacles may be used for this purpose.
- 4.1.5.12 Packagings must be made of materials compatible with, and impermeable to, the explosives contained in the package, so that neither interaction between the explosives and the packaging materials, nor leakage, causes the explosive to become unsafe to transport, or the hazard division or compatibility group to change.
- 4.1.5.13 The ingress of explosive substances into the recesses of seamed metal packagings must be prevented.
- 4.1.5.14 Plastics packagings must not be liable to generate or accumulate sufficient static electricity so that a discharge could cause the packaged explosive substances or articles to initiate, ignite or function.
- 4.1.5.15 Large and robust explosives articles, normally intended for military use, without their means of initiation or with their means of initiation containing at least two effective protective features, may be carried unpackaged. When such articles have propelling charges or are self-propelled, their ignition systems must be protected against stimuli encountered during normal conditions of transport. A negative result in test series 4 on an unpackaged article indicates that the article can be considered for transport unpackaged. Such unpackaged articles may be fixed to cradles or contained in crates or other suitable handling, storage or launching devices in such a way that they will not become loose during normal conditions of transport.

Where such large explosive articles are as part of their operational safety and suitability tests subjected to test regimes that meet the intentions of UN23 and such tests have been successfully undertaken, the competent authority may approve such articles to be transported under the relevant Regulations.

- 4.1.5.16 Explosive substances must not be packed in inner or outer packagings where the differences in internal and external pressures, due to thermal or other effects, could cause an explosion or rupture of the package.
- 4.1.5.17 Whenever loose explosive substances or the explosive substance of an uncased or partly cased article may come into contact with the inner surface of metal packagings (1A1, 1A2, 1B1, 1B2, 4A, 4B and metal receptacles), the metal packaging shall be provided with an inner liner or coating (see 4.1.1.2).
- 4.1.5.18 Packing instruction P101 may be used for any explosive provided the package has been approved by a competent authority regardless of whether the packaging complies with the packing instruction assignment in the Dangerous Goods List.

## **4.1.6 SPECIAL PACKING PROVISIONS FOR GOODS OF CLASS 2**

### **4.1.6.1 General requirements**

- 4.1.6.1.1 This section provides general requirements applicable to the use of pressure receptacles for the transport of Class 2 gases and other dangerous goods in pressure receptacles (e.g. UN 1051 hydrogen cyanide, stabilised). Pressure receptacles must be constructed and closed so as to prevent any loss of contents which might be caused under normal conditions of transport, including by vibration, or by changes in temperature, humidity or pressure (resulting from change in altitude, for example).
- 4.1.6.1.2 Parts of pressure receptacles which are in direct contact with dangerous goods must not be affected or weakened by those dangerous goods and must not cause a dangerous effect (e.g. catalysing a reaction or reacting with the dangerous goods). The provisions of ISO 11114-1:2020 and ISO 11114-2:2021 must be met as applicable.
- 4.1.6.1.3 Pressure receptacles, including their closures, must be selected to contain a gas or a mixture of gases according to the requirements of 6.2.1.2 and the requirements of the specific packing instructions of 4.1.4.1. This section also applies to pressure receptacles which are elements of MEGCs.
- 4.1.6.1.4 Refillable pressure receptacles must not be filled with a gas or gas mixture different from that previously contained unless the necessary operations for change of gas service have been performed. The change of service for compressed and liquefied gases must be in accordance with ISO 11621:1997 or AS 2030.1, as applicable. In addition, a pressure receptacle that previously contained a Class 8 corrosive substance or a substance of another class with a corrosive subsidiary hazard must not be authorised for the transport of a Class 2 substance unless the necessary inspection and testing as specified in 6.2.1.6 have been performed.

- 4.1.6.1.5 Prior to filling, the filler must perform an inspection of the pressure receptacle and ensure that the pressure receptacle is authorised for the gas and, in case of a chemical under pressure, for the propellant, to be transported and that the provisions of this Code have been met. Shut-off valves must be closed after filling and remain closed during transport. The consignor must verify that the closures and equipment are not leaking.
- 4.1.6.1.6 Pressure receptacles must be filled according to the working pressures, filling ratios and provisions specified in the appropriate packing instruction for the specific substance being filled and taking into account the lowest pressure rating of any component. Service equipment having a pressure rating lower than other components must nevertheless comply with 6.2.1.3.1. Reactive gases and gas mixtures must be filled to a pressure such that if complete decomposition of the gas occurs, the working pressure of the pressure receptacle must not be exceeded.
- 4.1.6.1.7 Pressure receptacles, including their closures, must conform to the design, construction, inspection and testing requirements detailed in chapter 6.2. When outer packagings are prescribed, the pressure receptacles must be firmly secured therein. Unless otherwise specified in the detailed packing instructions, one or more inner packagings may be enclosed in an outer packaging.
- 4.1.6.1.8 Valves must be designed and constructed in such a way that they are inherently able to withstand damage without release of the contents or must be protected from damage which could cause inadvertent release of the contents of the pressure receptacle, by one of the following methods:
- (a) Valves are placed inside the neck of the pressure receptacle and protected by a threaded plug or cap;
  - (b) Valves are protected by caps or guards. Caps must possess vent-holes of sufficient cross-sectional area to evacuate the gas if leakage occurs at the valves;
  - (c) Valves are protected by shrouds or permanent protective attachments;
  - (d) Pressure receptacles are transported in frames, (e.g. bundles); or
  - (e) Pressure receptacles are transported in an outer packaging. The packaging as prepared for transport must be capable of meeting the drop test specified in 6.1.5.3 at the packing group I performance level.
- For pressure receptacles with valves as described in (b) and (c), the requirements of ISO 11117:1998, ISO 11117:2008 + Cor 1:2009 or ISO 11117:2019 must be met. Requirements for shrouds and permanent protective attachments used as valve protection under (c), are given in the relevant pressure receptacle shell design standards, see 6.2.2.1. Valves with inherent protection used for refillable pressure receptacles shall meet the requirements of clause 4.6.2 of ISO 10297:2006 or clause 5.5.2 of ISO 10297:2014 or clause 5.5.2 of ISO 10297:2014 + Amd 1:2017, or in case of self-closing valves, of clause 5.4.2 of ISO 17879:2017. For valves with inherent protection used for non-refillable

cylinders, the requirements of clause 9.2.5 of ISO 11118:2015 or of clause 9.2.5 of ISO 11118:2015 + Amd 1:2019 shall be met.

For metal hydride storage systems, the valve protection requirements specified in ISO 16111:2008 or ISO 16111:2018 must be met.

4.1.6.1.9

Non-refillable pressure receptacles must:

- (a) be transported in an outer packaging, such as a box, or crate, or in shrink-wrapped trays or stretch-wrapped trays;
- (b) be of a water capacity less than or equal to 1.25 litres when filled with flammable or toxic gas;
- (c) not be used for toxic gases with an LC<sub>50</sub> less than or equal to 200 ml/m<sup>3</sup>; and
- (d) not be repaired after being put into service.

4.1.6.1.10

Refillable pressure receptacles, other than closed cryogenic receptacles, must be periodically inspected according to the provisions of 6.2.1.6 and packing instruction P200, P205, P206 or P208 as applicable. Pressure relief valves for closed cryogenic receptacles must be subject to periodic inspections and tests according to the provisions of 6.2.1.6.3 and packing instruction P203. Pressure receptacles must not be filled after they become due for periodic inspection but may be transported after the expiry of the time limit.

4.1.6.1.11

Repairs must be consistent with the fabrication and testing requirements of the applicable design and construction standards and are only permitted as indicated in the relevant periodic inspection standards specified in AS 2030. Pressure receptacles, other than the jacket of closed cryogenic receptacles, must not be subjected to repairs of any of the following:

- (a) Weld cracks or other weld defects;
- (b) Cracks in walls;
- (c) Leaks or defects in the material of the wall, head or bottom.

4.1.6.1.12

Pressure receptacles must not be offered for filling:

- (a) when damaged to such an extent that the integrity of the pressure receptacle or its service equipment may be affected;
- (b) unless the pressure receptacle and its service equipment has been examined and found to be in good working order; or
- (c) unless the required certification, retest, and filling marks are legible.

4.1.6.1.13

Filled pressure receptacles must not be offered for transport;

- (a) when leaking;
- (b) when damaged to such an extent that the integrity of the pressure receptacle or its service equipment may be affected;
- (c) unless the pressure receptacle and its service equipment has been examined and found to be in good working order; or
- (d) unless the required certification, retest, and filling marks are legible.

## 4.1.7

### **SPECIAL PACKING PROVISIONS FOR ORGANIC PEROXIDES (DIVISION 5.2) AND SELF-REACTIVE SUBSTANCES OF DIVISION 4.1**

#### 4.1.7.0.1

For organic peroxides, all receptacles must be "effectively closed". Where significant internal pressure may develop in a package by the evolution of a gas, a vent may be fitted, provided the gas emitted will not cause danger, otherwise the degree of filling must be limited. Any venting device must be so constructed that liquid will not escape when the package is in an upright position and it must be able to prevent ingress of impurities. The outer packaging, if any, must be so designed as not to interfere with the operation of the venting device.

#### 4.1.7.1

##### **Use of Packagings (Except IBCs)**

##### 4.1.7.1.1

Packagings for organic peroxides and self-reactive substances must conform to the requirements of chapter 6.1 and must meet its test requirements for packing group II.

##### 4.1.7.1.2

The packing methods for organic peroxides and self-reactive substances are listed in packing instruction P520 and are designated OP1 to OP8. The quantities specified for each packing method are the maximum quantities authorised per package.

##### 4.1.7.1.3

The packing methods appropriate for the individual currently assigned organic peroxides and self-reactive substances are listed in 2.4.2.3.2.3 and 2.5.3.2.4.

##### 4.1.7.1.4

For new organic peroxides, new self-reactive substances or new formulations of currently assigned organic peroxides or self-reactive substances, the following procedure must be used to assign the appropriate packing method:

(a) **ORGANIC PEROXIDE, TYPE B or SELF-REACTIVE SUBSTANCE, TYPE B:**

Packing method OP5 must be assigned, provided that the organic peroxide (or self-reactive substance) satisfies the criteria of 2.5.3.3.2(b) (resp. 2.4.2.3.3.2(b)) in a packaging authorised by the packing method. If the organic peroxide (or self-reactive substance) can only satisfy these criteria in a smaller packaging than those authorised by packing method OP5 (viz. one of the packagings listed for OP1 to OP4), then the corresponding packing method with the lower OP number is assigned;

(b) **ORGANIC PEROXIDE, TYPE C or SELF-REACTIVE SUBSTANCE, TYPE C:**

Packing method OP6 must be assigned, provided that the organic peroxide (or self-reactive substance) satisfies the criteria of 2.5.3.3.2(c) (resp. 2.4.2.3.3.2(c)) in packaging authorised by the packing method. If the organic peroxide (or self-reactive substance) can only satisfy these criteria in a smaller packaging than those authorised by packing method OP6 then the corresponding packing method with the lower OP number is assigned;

- (c) ORGANIC PEROXIDE, TYPE D or SELF-REACTIVE SUBSTANCE, TYPE D:

Packing method OP7 must be assigned to this type of organic peroxide or self-reactive substance;

- (d) ORGANIC PEROXIDE, TYPE E or SELF-REACTIVE SUBSTANCE, TYPE E:

Packing method OP8 must be assigned to this type of organic peroxide or self-reactive substance;

- (e) ORGANIC PEROXIDE, TYPE F or SELF-REACTIVE SUBSTANCE, TYPE F:

Packing method OP8 must be assigned to this type of organic peroxide or self-reactive substance.

#### 4.1.7.2

#### Use of intermediate bulk containers

##### 4.1.7.2.1

The currently assigned organic peroxides specifically listed in packing instruction IBC520 may be transported in IBCs in accordance with this packing instruction. IBCs must conform to the requirements of chapter 6.5 and must meet its test requirements for packing group II.

##### 4.1.7.2.2

Other organic peroxides and self-reactive substances of type F may be transported in IBCs under conditions determined by the competent authority of the jurisdiction of origin when, on the basis of the appropriate tests, that competent authority is satisfied that such transport may be safely conducted. The tests undertaken must include those necessary:

- (a) to prove that the organic peroxide (or self-reactive substance) complies with the principles for classification given in 2.5.3.3.2(f), exit box F of figure 2.5.1; (resp. 2.4.2.3.3.2 (f), exit box F of figure 2.4.1);
- (b) to prove the compatibility of all materials normally in contact with the substance during the transport;
- (c) to determine, when applicable, the control and emergency temperatures associated with the transport of the product in the IBC concerned as derived from the SADT;
- (d) to design, when applicable, pressure and emergency relief devices; and
- (e) to determine if any special provisions are necessary for safe transport of the substance.

##### 4.1.7.2.3

For self-reactive substances temperature control is required according to 2.4.2.3.4. For organic peroxides temperature control is required according to 2.5.3.4.1. Temperature control provisions are given in 7.1.5.3.

- 4.1.7.2.4 Emergencies to be taken into account are self-accelerating decomposition and fire engulfment. To prevent explosive rupture of metal IBCs with a complete metal casing, the emergency-relief devices must be designed to vent all the decomposition products and vapours evolved during self-accelerating decomposition or during a period of not less than one hour of complete fire engulfment calculated by the equations given in 4.2.1.13.8.
- 4.1.8 SPECIAL PACKING PROVISIONS FOR INFECTIOUS SUBSTANCES OF CATEGORY A (DIVISION 6.2, UN 2814 AND UN 2900)**
- 4.1.8.1 Packages of infectious substances must be prepared in such a manner that they arrive at their destination in good condition and present no hazard to persons or animals during transport.
- 4.1.8.2 The definitions in 1.2.1 and the general packing provisions of 4.1.1.1 to 4.1.1.14, except 4.1.1.10 to 4.1.1.12, apply to infectious substances packages. However, liquids must only be filled into packagings, which have an appropriate resistance to the internal pressure that may develop under normal conditions of transport.
- 4.1.8.3 An itemised list of contents must be enclosed between the secondary packaging and the outer packaging. When the infectious substances to be transported are unknown, but suspected of meeting the criteria for inclusion in category A, the words "suspected category A infectious substance" must be shown, in parentheses, following the proper shipping name on the document inside the outer packaging.
- 4.1.8.4 Before an empty packaging is returned to the consignor, or sent elsewhere, it must be disinfected or sterilised to nullify any hazard and any label or mark indicating that it had contained an infectious substance must be removed or obliterated.
- 4.1.8.5 Provided an equivalent level of performance is maintained, the following variations in the primary receptacles placed within a secondary packaging are allowed without further testing of the completed package:
- (a) Primary receptacles of equivalent or smaller size as compared to the tested primary receptacles may be used provided:
    - (i) The primary receptacles are of similar design to the tested primary receptacle (e.g. shape: round, rectangular, etc.);
    - (ii) The material of construction of the primary receptacle (glass, plastics, metal, etc.) offers resistance to impact and stacking forces equal to or greater than that of the originally tested primary receptacle;
    - (iii) The primary receptacles have the same or smaller openings and the closure is of similar design (e.g. screw cap, friction lid, etc.);
    - (iv) Sufficient additional cushioning material is used to take up void spaces and to prevent significant movement of the primary receptacles; and
    - (v) Primary receptacles are oriented within the secondary packaging in the same manner as in the tested package;

- (b) A lesser number of the tested primary receptacles, or of the alternative types of primary receptacles identified in (a) above, may be used provided sufficient cushioning is added to fill the void space(s) and to prevent significant movement of the primary receptacles.

### **SPECIAL PACKING PROVISIONS FOR RADIOACTIVE MATERIAL**

Reserved

**NOTE:** *The following information from the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) now replaces the information found in earlier editions of the ADG Code.*

[Code for the Safe Transport of Radioactive Material](#)

*See general comments on page xvi.*

## **CHAPTER 4.2: USE OF PORTABLE TANKS AND MULTIPLE-ELEMENT GAS CONTAINERS (MEGCs)**

### **4.2.1 GENERAL PROVISIONS FOR THE USE OF PORTABLE TANKS FOR THE TRANSPORT OF SUBSTANCES OF CLASS 1 AND CLASSES 3 TO 9**

- 4.2.1.1 This section provides general requirements applicable to the use of portable tanks for the transport of substances of Classes 1, 3, 4, 5, 6, 7, 8 and 9. In addition to these general requirements, portable tanks must conform to the design, construction, inspection and testing requirements detailed in 6.7.2. Substances must be transported in portable tanks conforming to the applicable portable tank instruction identified in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6 (T1 to T23) and the portable tank special provisions assigned to each substance in Column 11 of the Dangerous Goods List and described in 4.2.5.3.
- 4.2.1.2 During transport, portable tanks must be adequately protected against damage to the shell and service equipment resulting from lateral and longitudinal impact and overturning. If the shell and service equipment are so constructed as to withstand impact or overturning it need not be protected in this way. Examples of such protection are given in 6.7.2.17.5.
- 4.2.1.3 Certain substances are chemically unstable. They are accepted for transport only when the necessary steps have been taken to prevent their dangerous decomposition, transformation or polymerisation during transport. To this end, care must in particular be taken to ensure that shells do not contain any substances liable to promote these reactions.
- 4.2.1.4 The temperature of the outer surface of the shell excluding openings and their closures or of the thermal insulation must not exceed 70 °C during transport. When necessary, the shell must be thermally insulated.
- 4.2.1.5 Empty portable tanks not cleaned and not gas-free must comply with the same requirements as portable tanks filled with the previous substance.
- 4.2.1.6 Substances must not be transported in the same or adjoining compartments of shells when they may react dangerously with each other and cause:
- (a) combustion and/or evolution of considerable heat;
  - (b) evolution of flammable, toxic or asphyxiant gases;
  - (c) the formation of corrosive substances;
  - (d) the formation of unstable substances;
  - (e) dangerous rise in pressure.

**4.2.1.7**                      **Reserved**

**4.2.1.8**                      **Reserved**

**4.2.1.9**                      **Degree of Filling**

4.2.1.9.1                      Prior to filling, steps must be taken to ensure that the appropriate portable tank is used and that the portable tank is not loaded with substances which in contact with the materials of the shell, gaskets, service equipment and any protective linings, are likely to react dangerously with them to form dangerous products or appreciably weaken these materials. It may be necessary to consult the manufacturer of the substance in conjunction with the competent authority for guidance on the compatibility of the substance with the portable tank materials.

4.2.1.9.1.1                      Portable tanks must not be filled above the extent provided in 4.2.1.9.2 to 4.2.1.9.6. The applicability of 4.2.1.9.2, 4.2.1.9.3 or 4.2.1.9.5.1 to individual substances is specified in the applicable portable tank instructions or special provisions in 4.2.5.2.6 or 4.2.5.3 and Columns 10 or 11 of the Dangerous Goods List.

4.2.1.9.2                      The maximum degree of filling (in %) for general use is determined by the formula:

$$\text{Degree of filling} = \frac{97}{1 + \alpha (t_r - t_f)}$$

4.2.1.9.3                      The maximum degree of filling (in %) for liquids of Division 6.1 and Class 8, in packing groups I and II, and liquids with an absolute vapour pressure of more than 175 kPa (1.75 bar) at 65 °C, is determined by the formula:

$$\text{Degree of filling} = \frac{95}{1 + \alpha (t_r - t_f)}$$

4.2.1.9.4                      In these formulae,  $\alpha$  is the mean coefficient of cubical expansion of the liquid between the mean temperature of the liquid during filling ( $t_f$ ) and the maximum mean bulk temperature during transport ( $t_r$ ) (both in °C). For liquids transported under ambient conditions  $\alpha$  could be calculated by the formula:

$$\alpha = \frac{d_{15} - d_{50}}{35d_{50}}$$

in which  $d_{15}$  and  $d_{50}$  are the densities of the liquid at 15 °C and 50 °C, respectively.

- 4.2.1.9.4.1 The maximum mean bulk temperature ( $t_r$ ) must be taken as 50 °C except that, for journeys under temperate or extreme climatic conditions, the competent authorities concerned may agree to a lower or require a higher temperature, as appropriate.
- 4.2.1.9.5 The requirements of 4.2.1.9.2 to 4.2.1.9.4.1 do not apply to portable tanks which contain substances maintained at a temperature above 50 °C during transport (e.g. by means of a heating device). For portable tanks equipped with a heating device, a temperature regulator must be used to ensure the maximum degree of filling is not more than 95% full at any time during transport.
- 4.2.1.9.5.1 The maximum degree of filling (in %) for solids transported above their melting points and for elevated temperature liquids must be determined by the following formula:

$$\text{Degree of filling} = 95 \frac{d_r}{d_f}$$

in which  $d_f$  and  $d_r$  are the densities of the liquid at the mean temperature of the liquid during filling and the maximum mean bulk temperature during transport respectively.

- 4.2.1.9.6 Portable tanks must not be offered for transport:
- (a) with a degree of filling, for liquids having a viscosity less than 2,680 mm<sup>2</sup>/s at 20 °C or maximum temperature of the substance during transport in the case of the heated substance, of more than 20% but less than 80% unless the shells of portable tanks are divided, by partitions or surge plates, into sections of not more than 7,500 litres capacity;
  - (b) with residue of substances previously transported adhering to the outside of the shell or service equipment;
  - (c) when leaking or damaged to such an extent that the integrity of the portable tank or its lifting or securing arrangements may be affected; and
  - (d) unless the service equipment has been examined and found to be in good working order.
- 4.2.1.9.7 Forklift pockets of portable tanks must be closed off when the tank is filled. This provision does not apply to portable tanks which according to 6.7.2.17.4 need not be provided with a means of closing off the forklift pockets.
- 4.2.1.10 Additional provisions applicable to the transport of Class 3 substances in portable tanks**
- 4.2.1.10.1 All portable tanks intended for the transport of flammable liquids must be closed and be fitted with relief devices in accordance with 6.7.2.8 to 6.7.2.15.
- 4.2.1.10.1.1 Reserved

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>4.2.1.13</b> | <p><b>Additional provisions applicable to the transport of Division 5.2 substances and Division 4.1 self-reactive substances in portable tanks</b></p>                                                                                                                                                                                                                                                                                                                                                         |
| 4.2.1.13.1      | <p>Each substance must have been tested as necessary:</p> <ul style="list-style-type: none"> <li>(a) to prove the compatibility of all materials normally in contact with the substance during transport;</li> <li>(b) to provide data for the design of the pressure and emergency relief devices taking into account the design characteristics of the portable tank.</li> </ul> <p>Any additional provision necessary for safe transport of the substance must be clearly described in the test report.</p> |
| 4.2.1.13.2      | <p>The following provisions apply to portable tanks intended for the transport of Type F organic peroxides or Type F self-reactive substances with a Self-Accelerating Decomposition Temperature (SADT) of 55 °C or more. In case of conflict these provisions prevail over those specified in section 6.7.2. Emergencies to be taken into account are self-accelerating decomposition of the substance and fire-engulfment as described in 4.2.1.13.8.</p>                                                    |
| 4.2.1.13.3      | <p>The additional provisions for transport of organic peroxides or self-reactive substances with an SADT less than 55 °C in portable tanks must be determined by the competent authority of the jurisdiction of origin. Notification thereof must be sent to the competent authority of the jurisdiction of destination.</p>                                                                                                                                                                                   |
| 4.2.1.13.4      | <p>The portable tank must be designed for a test pressure of at least 0.4 MPa (4 bar).</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 4.2.1.13.5      | <p>Portable tanks must be fitted with temperature sensing devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4.2.1.13.6      | <p>Portable tanks must be fitted with pressure-relief devices and emergency-relief devices. Vacuum-relief devices may also be used. Pressure-relief devices must operate at pressures determined according to both the properties of the substance and the construction characteristics of the portable tank. Fusible elements are not allowed in the shell.</p>                                                                                                                                               |

4.2.1.13.7 The pressure-relief devices must consist of spring-loaded valves fitted to prevent significant build-up within the portable tank of the decomposition products and vapours released at a temperature of 50°C. The capacity and start-to-discharge pressure of the relief valves must be based on the results of the tests specified in 4.2.1.13.1. The start-to-discharge pressure must, however, in no case be such that liquid would escape from the valve(s) if the portable tank were overturned.

4.2.1.13.8 The emergency-relief devices may be of the spring-loaded or frangible types, or a combination of the two, designed to vent all the decomposition products and vapours evolved during a period of not less than one hour of complete fire-engulfment as calculated by the following formula:

$$q = 70961 \times F \times A^{0.82}$$

where:

q = heat absorption [W]

A = wetted area [m<sup>2</sup>]

F = insulation factor

F = 1 for non-insulated shells, or

$$F = \frac{U(923-T)}{47032} \text{ for insulated shells}$$

where:

K = heat conductivity of insulation layer [ $W \times m^{-1} \times K^{-1}$ ]

L = thickness of insulation layer [m]

U = K/L = heat transfer coefficient of the insulation [ $W \times m^{-2} \times K^{-1}$ ]

T = temperature of substance at relieving conditions [K]

The start-to-discharge pressure of the emergency-relief device(s) must be higher than that specified in 4.2.1.13.7 and based on the results of the tests referred to in 4.2.1.13.1. The emergency-relief devices must be dimensioned in such a way that the maximum pressure in the portable tank never exceeds the test pressure of the tank.

**NOTE:** An example of a method to determine the size of emergency-relief devices is given in Appendix 5 of the Manual of Tests and Criteria.

4.2.1.13.9 For insulated portable tanks the capacity and setting of emergency-relief device(s) must be determined assuming a loss of insulation from 1% of the surface area.

4.2.1.13.10 Vacuum-relief devices and spring-loaded valves must be provided with flame arresters. Due attention must be paid to the reduction of the relief capacity caused by the flame arrester.

|                 |                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.2.1.13.11     | Service equipment such as valves and external piping must be so arranged that no substance remains in them after filling the portable tank.                                                                                                                                                             |
| 4.2.1.13.12     | Portable tanks may be either insulated or protected by a sun-shield. If the SADT of the substance in the portable tank is 55 °C or less, or the portable tank is constructed of aluminium, the portable tank must be completely insulated. The outer surface must be finished in white or bright metal. |
| 4.2.1.13.13     | The degree of filling must not exceed 90% at 15°C.                                                                                                                                                                                                                                                      |
| 4.2.1.13.14     | The mark as required in 6.7.2.20.2 must include the UN number and the technical name with the approved concentration of the substance concerned.                                                                                                                                                        |
| 4.2.1.13.15     | Organic peroxides and self-reactive substances specifically listed in portable tank instruction T23 in 4.2.5.2.6 may be transported in portable tanks.                                                                                                                                                  |
| <b>4.2.1.14</b> | <b>Additional provisions applicable to the transport of Division 6.1 substances in portable tanks</b><br><br>Reserved                                                                                                                                                                                   |
| <b>4.2.1.15</b> | <b>Additional provisions applicable to the transport of Division 6.2 substances in portable tanks</b><br><br>Reserved                                                                                                                                                                                   |
| <b>4.2.1.16</b> | <b>Additional provisions applicable to the transport of Class 7 substances in portable tanks</b>                                                                                                                                                                                                        |
| 4.2.1.16.1      | Portable tanks used for the transport of radioactive material must not be used for the transport of other goods.                                                                                                                                                                                        |
| 4.2.1.16.2      | Reserved                                                                                                                                                                                                                                                                                                |
| <b>4.2.1.17</b> | <b>Additional provisions applicable to the transport of Class 8 substances in portable tanks</b>                                                                                                                                                                                                        |
| 4.2.1.17.1      | Pressure-relief devices of portable tanks used for the transport of Class 8 substances must be inspected at intervals not exceeding one year.                                                                                                                                                           |

#### **4.2.1.19 Additional provisions applicable to the transport of solid substances transported above their melting point**

4.2.1.19.1 Solid substances transported or offered for transport above their melting point which are not assigned a portable tank instruction in column (10) of the Dangerous Goods List or when the assigned portable tank instruction does not apply to transport at temperatures above their melting point may be transported in portable tanks provided that the solid substances are classified in Divisions 4.1, 4.2, 4.3, 5.1 or 6.1 or Classes 8 or 9 and have no subsidiary hazard other than that of Division 6.1 or Class 8 and are in packing group II or III.

4.2.1.19.2 Unless otherwise indicated in the Dangerous Goods List of Chapter 3.2, portable tanks used for the transport of these solid substances above their melting point must conform to the provisions of portable tank instruction T4 for solid substances of packing group III or T7 for solid substances of packing group II. A portable tank that affords an equivalent or greater level of safety may be selected according to 4.2.5.2.5. The maximum degree of filling (in %) must be determined according to 4.2.1.9.5 (TP3).

#### **4.2.2 GENERAL PROVISIONS FOR THE USE OF PORTABLE TANKS FOR THE TRANSPORT OF NON-REFRIGERATED LIQUEFIED GASES AND CHEMICALS UNDER PRESSURE**

4.2.2.1 This section provides general requirements applicable to the use of portable tanks for the transport of non-refrigerated liquefied gases and chemicals under pressure.

4.2.2.2 Portable tanks must conform to the design, construction, inspection and testing requirements detailed in 6.7.3. Non-refrigerated liquefied gases and chemicals under pressure must be transported in portable tanks conforming to portable tank instruction T50 as described in 4.2.5.2.6 and any portable tank special provisions assigned to specific non-refrigerated liquefied gases in Column 11 of the Dangerous Goods List and described in 4.2.5.3.

4.2.2.3 During transport, portable tanks must be adequately protected against damage to the shell and service equipment resulting from lateral and longitudinal impact and overturning. If the shell and service equipment are so constructed as to withstand impact or overturning it need not be protected in this way. Examples of such protection are given in 6.7.3.13.5.

4.2.2.4 Certain non-refrigerated liquefied gases are chemically unstable. They are accepted for transport only when the necessary steps have been taken to prevent their dangerous decomposition, transformation or polymerisation during transport. To this end, care must in particular be taken to ensure that portable tanks do not contain any non-refrigerated liquefied gases liable to promote these reactions.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4.2.2.5</b> | <b>Reserved</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 4.2.2.6        | Empty portable tanks not cleaned and not gas-free must comply with the same requirements as portable tanks filled with the previous non-refrigerated liquefied gas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>4.2.2.7</b> | <b>Filling</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 4.2.2.7.1      | Prior to filling, steps must be taken to ensure that the portable tank is approved for the non-refrigerated liquefied gas or the propellant of the chemical under pressure to be transported and that the portable tank is not loaded with non-refrigerated liquefied gases, or with chemicals under pressure, which in contact with the materials of the shell, gaskets and service equipment, are likely to react dangerously with them to form dangerous products or appreciably weaken these materials. During filling, the temperature of the non-refrigerated liquefied gas or propellant of chemicals under pressure must fall within the limits of the design temperature range. |
| 4.2.2.7.2      | The maximum mass of non-refrigerated liquefied gas per litre of shell capacity (kg/L) must not exceed the density of the non-refrigerated liquefied gas at 50 °C multiplied by 0.95. Furthermore, the shell must not be liquid-full at 60 °C.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4.2.2.7.3      | Portable tanks must not be filled above their maximum permissible gross mass and the maximum permissible load mass specified for each gas to be transported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>4.2.2.8</b> | <b>Portable tanks must not be offered for transport:</b> <ul style="list-style-type: none"> <li>(a) in an ullage condition liable to produce an unacceptable hydraulic force due to surge within the portable tank;</li> <li>(b) when leaking;</li> <li>(c) when damaged to such an extent that the integrity of the tank or its lifting or securing arrangements may be affected; and</li> <li>(d) unless the service equipment has been examined and found to be in good working order.</li> </ul>                                                                                                                                                                                     |
| 4.2.2.9        | Forklift pockets of portable tanks must be closed off when the tank is filled. This provision does not apply to portable tanks which according to 6.7.3.13.4 need not be provided with a means of closing off the forklift pockets.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>4.2.3</b>   | <b>GENERAL PROVISIONS FOR THE USE OF PORTABLE TANKS FOR THE TRANSPORT OF REFRIGERATED LIQUEFIED GASES</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 4.2.3.1        | This section provides general requirements applicable to the use of portable tanks for the transport of refrigerated liquefied gases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

- 4.2.3.2 Portable tanks must conform to the design, construction, inspection and testing requirements detailed in 6.7.4. Refrigerated liquefied gases must be transported in portable tanks conforming to portable tank instruction T75 as described in 4.2.5.2.6 and the portable tank special provisions assigned to each substance in Column 11 of the Dangerous Goods List and described in 4.2.5.3.
- 4.2.3.3 During transport, portable tanks must be adequately protected against damage to the shell and service equipment resulting from lateral and longitudinal impact and overturning. If the shell and service equipment are so constructed as to withstand impact or overturning it need not be protected in this way. Examples of such protection are provided in 6.7.4.12.5.
- 4.2.3.4 Reserved**
- 4.2.3.5 Empty portable tanks not cleaned and not gas-free must comply with the same requirements as portable tanks filled with the previous substance.
- 4.2.3.6 Filling**
- 4.2.3.6.1 Prior to filling, steps must be taken to ensure that the portable tank is approved for the refrigerated liquefied gas to be transported and that the portable tank is not loaded with refrigerated liquefied gases which in contact with the materials of the shell, gaskets and service equipment, are likely to react dangerously with them to form dangerous products or appreciably weaken these materials. During filling, the temperature of the refrigerated liquefied gas must be within the limits of the design temperature range.
- 4.2.3.6.2 In estimating the initial quantity of gas filled into the shell, the necessary holding time for the intended journey including any delays which might be encountered must be taken into consideration. The initial quantity of gas filled into the shell of the shell, except as provided for in 4.2.3.6.3 and 4.2.3.6.4, must be such that if the contents, except helium, were to be raised to a temperature at which the vapour pressure is equal to the maximum allowable working pressure (MAWP) the volume occupied by liquid would not exceed 98%.
- 4.2.3.6.3 Shells intended for the transport of helium can be filled up to but not above the inlet of the pressure-relief device.
- 4.2.3.6.4 A higher initial quantity of gas filled into the shell may be allowed, subject to competent authority exemption, when the intended duration of transport is considerably shorter than the holding time.
- 4.2.3.7 Actual holding time**
- 4.2.3.7.1 The actual holding time must be calculated for each journey in accordance with a procedure recognised by the competent authority, on the basis of the following:
- (a) The reference holding time for the refrigerated liquefied gas to be transported (see 6.7.4.2.8.1) (as indicated on the plate referred to in 6.7.4.15.1);

- (b) The actual filling density;
- (c) The actual filling pressure;
- (d) The lowest set pressure of the pressure limiting device(s).

4.2.3.7.2 The actual holding time must be marked either on the portable tank itself or on a metal plate firmly secured to the portable tank, in accordance with 6.7.4.15.2.

4.2.3.7.3 The date at which the actual holding time ends must be entered in the transport document (see 11.1.1.5.13).

#### **4.2.3.8 Portable tanks must not be offered for transport:**

- (a) in an ullage condition liable to produce an unacceptable hydraulic force due to surge within the shell;
- (b) when leaking;
- (c) when damaged to such an extent that the integrity of the portable tank or its lifting or securing arrangements may be affected;
- (d) unless the service equipment has been examined and found to be in good working order;
- (e) unless the actual holding time for the refrigerated liquefied gas being transported has been determined in accordance with 4.2.3.7 and the portable tank is marked in accordance with 6.7.4.15.2; and
- (f) unless the duration of transport, after taking into consideration any delays which might be encountered, does not exceed the actual holding time.

4.2.3.9 Forklift pockets of portable tanks must be closed off when the tank is filled. This provision does not apply to portable tanks which according to 6.7.4.12.4 need not be provided with a means of closing off the forklift pockets.

#### **4.2.4 GENERAL PROVISIONS FOR THE USE OF MULTIPLE-ELEMENT GAS CONTAINERS (MEGCS)**

4.2.4.1 This section provides general requirements applicable to the use of multiple-element gas containers (MEGCs) for the transport of non-refrigerated gases.

4.2.4.2 MEGCs must conform to the design, construction, inspection and testing requirements detailed in 6.7.5. The elements of MEGCs must be periodically inspected according to the provisions set out in P200 and in 6.2.1.6.

4.2.4.3 During transport, MEGCs must be protected against damage to the elements and service equipment resulting from lateral and longitudinal impact and overturning. If the elements and service equipment are so constructed as to withstand impact or overturning, they need not be protected in this way. Examples of such protection are given in 6.7.5.10.4.

4.2.4.4 The periodic testing and inspection requirements for MEGCs are specified in 6.7.5.12. MEGCs or their elements must not be charged or filled after they become due for periodic inspection but may be transported after the expiry of the time limit.

#### 4.2.4.5

### Filling

##### 4.2.4.5.1

Prior to filling, the MEGC must be inspected to ensure that it is authorised for the gas to be transported and that the applicable provisions of this Code have been met.

##### 4.2.4.5.2

Elements of MEGCs must be filled according to the working pressures, filling ratios and filling provisions specified in packing instruction P200 for the specific gas being filled into each element. In no case must a MEGC or group of elements be filled as a unit in excess of the lowest working pressure of any given element.

##### 4.2.4.5.3

MEGCs must not be filled above their maximum permissible gross mass.

##### 4.2.4.5.4

Isolation valves must be closed after filling and remain closed during transport. Toxic gases of division 2.3 must only be transported in MEGCs where each element is equipped with an isolation valve.

##### 4.2.4.5.5

The opening(s) for filling must be closed by caps or plugs. The leak-proofness of the closures and equipment must be verified by the consignor after filling.

##### 4.2.4.5.6

MEGCs must not be offered for filling:

- (a) when damaged to such an extent that the integrity of the pressure receptacles or its structural or service equipment may be affected;
- (b) unless the pressure receptacles and its structural and service equipment has been examined and found to be in good working order; and
- (c) unless the required certification, retest, and filling marks are legible.

##### 4.2.4.6

Charged MEGCs must not be offered for transport:

- (a) when leaking;
- (b) when damaged to such an extent that the integrity of the pressure receptacles or its structural or service equipment may be affected;
- (c) unless the pressure receptacles and its structural and service equipment have been examined and found to be in good working order; and
- (d) unless the required certification, retest, and filling marks are legible.

##### 4.2.4.7

Empty MEGCs that have not been cleaned and purged must comply with the same requirements as MEGCs filled with the previous substance.

#### 4.2.5

### PORTABLE TANK INSTRUCTIONS AND SPECIAL PROVISIONS

**NOTE:** For instructions on the use of road tank vehicles and rail tank wagons for dangerous goods, see Chapter 4.4.

## 4.2.5.1

### General

#### 4.2.5.1.1

This section includes the portable tank instructions and special provisions applicable to dangerous goods authorised to be transported in portable tanks. Each portable tank instruction is identified by an alpha-numeric designation (e.g. T1). Column 10 of the Dangerous Goods List in chapter 3.2 indicates the portable tank instruction that must be used for each substance permitted for transport in a portable tank. When no portable tank instruction appears in Column 10 for a specific dangerous goods entry then transport of the substance in portable tanks is not permitted unless a competent authority determination is granted as detailed in 6.7.1.3. Portable tank special provisions are assigned to specific dangerous goods in Column 11 of the Dangerous Goods List in chapter 3.2. Each portable tank special provision is identified by an alpha-numeric designation (e.g. TP1). A listing of the portable tank special provisions is provided in 4.2.5.3.

**NOTE:** *The gases authorised for transport in MEGCs are indicated in the column "MEGC" in Tables 1 and 2 of packing instruction P200 in 4.1.4.1.*

## 4.2.5.2

### Portable tank instructions

#### 4.2.5.2.1

Portable tank instructions apply to dangerous goods of Classes 1 to 9. Portable tank instructions provide specific information relevant to portable tanks provisions applicable to specific substances. These provisions must be met in addition to the general provisions of this Chapter and the general requirements of chapter 6.7 or chapter 6.9.

#### 4.2.5.2.2

For substances of Class 1 and Classes 3 to 9, the portable tank instructions indicate the applicable minimum test pressure, the minimum shell thickness (in reference steel or the minimum shell thickness of fibre-reinforced plastics), bottom opening requirements and pressure relief requirements. In T23, self-reactive substances of Division 4.1 and Division 5.2 organic peroxides permitted to be transported in portable tanks are listed along with the applicable control and emergency temperatures.

#### 4.2.5.2.3

Non-refrigerated liquefied gases are assigned to portable tank instruction T50. T50 provides the maximum allowable working pressures, bottom opening requirements, pressure relief requirements and filling ratio requirements for non-refrigerated liquefied gases permitted for transport in portable tanks.

#### 4.2.5.2.4

Refrigerated liquefied gases are assigned to portable tank instruction T75.

#### 4.2.5.2.5

Determination of the appropriate portable tank instructions

When a specific portable tank instruction is specified in Column 10 for a specific dangerous goods entry additional portable tanks which possess higher test pressures, greater shell thicknesses, more stringent bottom opening and pressure-relief device arrangements may be used. The fol-

lowing guidelines apply to determining the appropriate portable tanks which may be used for transport of particular substances:

**Table 4.2.5.2.5: Determination of the Appropriate Portable Tank Instructions**

| Portable tank instruction specified | Portable tank instructions also permitted                                                       |
|-------------------------------------|-------------------------------------------------------------------------------------------------|
| T1                                  | T2, T3, T4, T5, T6, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22 |
| T2                                  | T4, T5, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22             |
| T3                                  | T4, T5, T6, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22         |
| T4                                  | T5, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22                 |
| T5                                  | T10, T14, T19, T20, T22                                                                         |
| T6                                  | T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22                     |
| T7                                  | T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22                         |
| T8                                  | T9, T10, T13, T14, T19, T20, T21, T22                                                           |
| T9                                  | T10, T13, T14, T19, T20, T21, T22                                                               |
| T10                                 | T14, T19, T20, T22                                                                              |
| T11                                 | T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22                                           |
| T12                                 | T14, T16, T18, T19, T20, T22                                                                    |
| T13                                 | T14, T19, T20, T21, T22                                                                         |
| T14                                 | T19, T20, T22                                                                                   |
| T15                                 | T16, T17, T18, T19, T20, T21, T22                                                               |
| T16                                 | T18, T19, T20, T22                                                                              |
| T17                                 | T18, T19, T20, T21, T22                                                                         |
| T18                                 | T19, T20, T22                                                                                   |
| T19                                 | T20, T22                                                                                        |

**NOTE:** For the selection of suitable road tank vehicles or rail tank wagons where there is a “T” entry in Column 10 of the Dangerous Goods List, see Chapter 4.4.

#### 4.2.5.2.6

#### Portable tank instructions

Portable tank instructions specify the requirements applicable to a portable tank when used for the transport of specific substances. Portable tank instructions T1 to T22 specify the applicable minimum test pressure, the minimum shell thickness (in mm reference steel) or the minimum shell thickness of fibre-reinforced plastics (FRP) portable tanks, and the pressure-relief and bottom-opening requirements.

#### Tables 4.2.5.2.6: Portable Tank Instructions

| T1 - T22                                                                                                                                                                                                                                                                                                          |                             | PORTABLE TANK INSTRUCTIONS                                    |                                                         |                                                        | T1 - T22 |

| These portable tank instructions apply to liquid and solid substances of Class 1 and Classes 3 to 9.                                                                                                                                                                                                              |                             |                                                               |                                                         |                                                        |          |
| The general provisions of section 4.2.1 and the requirements of section 6.7.2 must be met. The instructions for portable tank with FRP shells apply to substances of Classes or Division 1, 3, 5.1, 6.1, 6.2, 8 and 9. Additionally, the requirements of section 6.9 apply to the portable tanks with FRP shells. |                             |                                                               |                                                         |                                                        |          |

| This portable tank instruction applies to self-reactive substances of Division 4.1 and organic peroxides of Division 5.2. The general provisions of section 4.2.1 and the requirements of section 6.7.2 must be met. The provisions specific to self-reactive substances of Division 4.1 and organic peroxides of Division 5.2 in 4.2.1.13 must also be met. The formulations not listed in 2.4.2.3.2.3 or 2.5.3.2.4 but listed below may also be transported packed in accordance with packing method OP8 of packing instruction P520 of 4.1.4.1, with the same control and emergency temperatures, if applicable. |                                                                            |                           |                                           |                             |                                                         |                   |               |                 |  |

**Table Note:**

- Provided that steps have been taken to achieve the safety equivalence of 65% tert-Butyl hydroperoxide and 35% water.*
- Diluent type B is tert-Butyl alcohol*
- maximum quantity per portable tank 2 000 kg.*
- As approved by the competent authority.*
- Formulation derived from distillation of peroxyacetic acid originating from peroxyacetic acid in concentration of not more than 41% water, total active oxygen (peroxyacetic acid+H<sub>2</sub>O<sub>2</sub>) ≤ 9.5%, which fulfils the criteria of 2.5.3.3.2 (f). "CORROSIVE" subsidiary hazard placard required (Model No 8, see 5.2.2.2.2).*

| <p>This portable tank instruction applies to refrigerated liquefied gases. The general provisions of section 4.2.3 and the requirements of section 6.7.4 must be met.</p> |                                  |            |

#### 4.2.5.3 Portable tank special provisions

Portable tank special provisions are assigned to certain substances to indicate provisions which are in addition to or in lieu of those provided by the portable tank instructions or the requirements in chapter 6.7. Portable tank special provisions are identified by an alphanumeric designation beginning with the letters "TP" (tank provision) and are assigned to specific substances in Column 11 of the Dangerous Goods List in chapter 3.2.

The following is a list of the portable tank special provisions:

TP1 The degree of filling prescribed in 4.2.1.9.2 must not be exceeded

$$\text{Degree of filling} = \frac{97}{1 + \alpha(t_r - t_f)}$$

TP2 The degree of filling prescribed in 4.2.1.9.3 must not be exceeded

$$\text{Degree of filling} = \frac{95}{1 + \alpha(t_r - t_f)}$$

TP3 The maximum degree of filling (in %) for solids transported above their melting points and for elevated temperature liquids must be determined in accordance with 4.2.1.9.5.

$$\text{Degree of filling} = 95 \frac{d_r}{d_f}$$

TP4 The degree of filling must not exceed 90% or, alternatively, any other value approved by the competent authority (see 4.2.1.16.2).

TP5 The restrictions on of filling prescribed in 4.2.3.6 must be met.

- TP6 To prevent the tank bursting in any event, including fire engulfment, it must be provided with pressure-relief devices which are adequate in relation to the capacity of the tank and to the nature of the substance transported. The device must also be compatible with the substance.
- TP7 Air must be eliminated from the vapour space by nitrogen or other means.
- TP8 The test pressure for the portable tank may be reduced to 1.5 bar when the flash point of the substances transported is greater than 0 °C.
- TP9 A substance under this description may only be transported in a portable tank under a determination granted by the competent authority.
- TP10 A lead lining, not less than 5 mm thick, which must be tested annually, or another suitable lining material approved by the competent authority is required. A portable tank may be offered for transport after the date of expiry of the last lining inspection for a period not to exceed three months beyond that date, after emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling.
- TP12 Deleted
- TP13 Self-contained breathing apparatus must be provided when this substance is transported.
- TP16 The tank must be fitted with a special device to prevent under-pressure and excess pressure during normal transport conditions. This device must be approved by the competent authority. Pressure-relief requirements are as indicated in 6.7.2.8.3 to prevent crystallisation of the product in the pressure-relief valve.
- TP17 Only inorganic non-combustible materials must be used for thermal insulation of the tank.
- TP18 Temperature must be maintained between 18 °C and 40 °C. Portable tanks containing solidified methacrylic acid must not be reheated during transport.
- TP19 At the time of construction, the minimum shell thickness determined according to 6.7.3.4 shall be increased by 3 mm as a corrosion allowance. Shell thickness must be verified ultrasonically at intervals midway between periodic hydraulic tests and must never be lower than the minimum shell thickness determined according to 6.7.3.4.
- TP20 This substance may only be transported in insulated tanks under a nitrogen blanket.
- TP21 The shell thickness must be not less than 8 mm. Tanks must be hydraulically tested and internally inspected at intervals not exceeding 2.5 years.
- TP22 Lubricant for joints or other devices must be oxygen compatible.
- TP23 Deleted
- TP24 The portable tank may be fitted with a device located under maximum filling conditions in the vapour space of the shell to prevent the build up of excess pressure due to the slow decomposition of the substance transported. This device must also prevent an unacceptable amount of leakage of liquid in the case of overturning or entry of foreign matter into the tank. This device must be approved by the competent authority or its authorised body.
- TP25 Sulphur trioxide 99.95% pure and above may be transported in tanks without an inhibitor provided that it is maintained at a temperature equal to or above 32.5 °C.
- TP26 When transported under heated conditions, the heating device must be fitted outside the shell. For UN 3176 this requirement only applies when the substance reacts dangerously with water.
- TP27 A portable tank having a minimum test pressure of 4 bar may be used if it is shown that a test pressure of 4 bar or less is acceptable according to the test pressure definition in 6.7.2.1.

TP28 A portable tank having a minimum test pressure of 2.65 bar may be used if it is shown that a test pressure of 2.65 bar or less is acceptable according to the test pressure definition in 6.7.2.1.

TP29 A portable tank having a minimum test pressure of 1.5 bar may be used if it is shown that a test pressure of 1.5 bar or less is acceptable according to the test pressure definition in 6.7.2.1.

TP30 This substance must be transported in insulated tanks.

TP31 This substance may only be transported in tanks in the solid state.

TP32 For UN Nos. 0331, 0332 and 3375, portable tanks may be used subject to the following conditions:

(a) To avoid unnecessary confinement, each portable tank constructed of metal or fibre-reinforced plastics must be fitted with a pressure-relief device that may be of the reclosing spring-loaded type, a frangible disc or a fusible element. The set to discharge or burst pressure, as applicable, must not be greater than 2.65 bar for portable tanks with minimum test pressures greater than 4 bar;

(b) For UN 3375 only, the suitability for transport in tanks must be demonstrated. One method to evaluate this suitability is test 8 (d) in test series 8 (see "Manual of Tests and Criteria", Part 1, sub-section 18.7).

(c) Substances must not be allowed to remain in the portable tank for any period that could result in caking. Appropriate measures must be taken to avoid accumulation and packing of substances in the tank (e.g. cleaning, etc).

TP33 The portable tank instruction assigned for this substance applies for granular and powdered solids and for solids which are filled and discharged at temperatures above their melting point which are cooled and transported as a solid mass. For solids which are transported above their melting point see 4.2.1.19.

TP34 Portable tanks need not be subjected to the impact test in 6.7.4.14.1 if the portable tank is marked "NOT FOR RAIL TRANSPORT" on the plate specified in 6.7.4.15.1 and also in letters of at least 10 cm high on both sides of the outer jacket.

TP35 Deleted

TP36 Fusible elements in the vapour space may be used on portable tanks.

TP37 Deleted

TP38 Deleted

TP39 Deleted

TP40 Portable tanks must not be transported when connected with spray application equipment.

TP41 The 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body, provided that the portable tank is dedicated to the transport of the organometallic substances to which this tank special provision is assigned. However this examination is required when the conditions of 6.7.2.19.7 are met.

TP42 Portable tanks are not authorised for the transport of caesium or rubidium dispersions.

#### **4.2.6 TRANSITIONAL MEASURES**

Portable tanks and MEGCs manufactured before 1 January 2012, that conform to the marking requirements of 6.7.2.20.1, 6.7.3.16.1, 6.7.4.15.1 or 6.7.5.13.1 of this Code, 7th edition, as published in 2007,

as relevant, may continue to be used if they comply with all other relevant requirements of the current edition of this Code including, when applicable, the requirement of 6.7.2.20.1 (g) for marking the symbol "S" on the plate when the shell or the compartment is divided by surge plates into sections of not more than 7 500 litres capacity. When the shell, or the compartment, was already divided by surge plates into sections of not more than 7 500 litres capacity before 1 January 2012, the capacity of the shell, or respectively of the compartment, need not be supplemented with the symbol "S" until the next periodic inspection or test according to 6.7.2.19.5 is performed.

Portable tanks manufactured before 1 January 2014 need not be marked with the portable tank instruction as required in 6.7.2.20.2, 6.7.3.16.2 and 6.7.4.15.2 until the next periodic inspection and test.

Portable tanks and MEGCs manufactured before 1 January 2014 need not comply with the requirements of 6.7.2.13.1 (f), 6.7.3.9.1 (e), 6.7.4.8.1 (e) and 6.7.5.6.1 (d) concerning the marking of the pressure relief devices.

## CHAPTER 4.3: USE OF BULK CONTAINERS (for solids)

### 4.3.1 GENERAL PROVISIONS

- 4.3.1.1 This section provides general requirements applicable to the use of containers for the transport of solid substances in bulk. Substances must be transported in bulk containers conforming to the applicable bulk container instruction identified by the letters BK in column 10 of the Dangerous Goods List, with the following meaning:
- BK1: the transport in sheeted bulk containers is permitted
- BK2: the transport in closed bulk containers is permitted
- BK3: the transport in flexible bulk containers is permitted
- The bulk container used must conform to the requirements of chapter 6.8.
- 4.3.1.2 Except as provided in 4.3.1.3, bulk containers may only be used when a substance is assigned to a bulk container code in Column 10 of the Dangerous Goods List in chapter 3.2.
- 4.3.1.3 When a substance is not assigned a bulk container code in Column 10 of the Dangerous Goods List in chapter 3.2, a determination in accordance with Regulation 1.5.1(2) may be issued by the competent authority. The determination must be included in the documentation of the consignment and contain, as a minimum, the information normally provided in the bulk container instruction and the conditions under which the substance must be transported. Appropriate measures should be initiated by the competent authority to include the assignment in the Dangerous Goods List.
- 4.3.1.4 Substances which may become liquid at temperatures likely to be encountered during transport, are not permitted in bulk containers.
- 4.3.1.5 Bulk containers must be siftproof and must be so closed that none of the contents can escape under normal conditions of transport including the effect of vibration, or by changes of temperature, humidity or pressure.
- 4.3.1.6 Bulk solids must be loaded into bulk containers and evenly distributed in a manner that minimises movement that could result in damage to the container or leakage of the dangerous goods.
- 4.3.1.7 Where venting devices are fitted they must be kept clear and operable.
- 4.3.1.8 Bulk solids must not react dangerously with the material of the bulk container, gaskets, equipment including lids and tarpaulins and with protective coatings which are in contact with the contents or significantly weaken them. Bulk containers must be so constructed or adapted that the goods can not penetrate between wooden floor coverings or come into contact with those parts of the bulk containers that may be affected by the materials or residues thereof.
- 4.3.1.9 Before being filled and offered for transport each bulk container must be inspected and cleaned to ensure that it does not contain any residue on the interior or exterior of the bulk container that could:

- (a) cause a dangerous reaction with the substance intended for transport;
  - (b) detrimentally affect the structural integrity of the bulk container; or
  - (c) affect the dangerous goods retention capabilities of the bulk container.
- 4.3.1.10 During transport, no dangerous residues may adhere to the outer surfaces of bulk containers.
- 4.3.1.11 If several closure systems are fitted in series, the system which is located nearest to the substance to be transported must be closed first before filling.
- 4.3.1.12 Empty bulk containers that have contained a dangerous substance must be treated in the same manner as is required by this Code for a filled bulk container, unless adequate measures have been taken to nullify any hazard.
- 4.3.1.13 If bulk containers are used for the carriage of bulk goods liable to cause a dust explosion, or evolve flammable vapours (e.g. for certain wastes) measures must be taken to exclude sources of ignition and prevent dangerous electrostatic discharge during transport filling or discharge of the substance.
- 4.3.1.14 Substances, for example wastes, which may react dangerously with one another and substances of different classes and goods not subject to this Code, which are liable to react dangerously with one another must not be mixed together in the same bulk container. Dangerous reactions are:
  - (a) combustion and/or evolution of considerable heat;
  - (b) emission of flammable and/or toxic gases;
  - (c) formation of corrosive liquids; or
  - (d) formation of unstable substances.
- 4.3.1.15 Before a bulk container is filled it must be visually examined to ensure it is structurally serviceable, its interior walls, ceiling and floors are free from protrusions or damage and that any inner liners or substance retaining equipment are free from rips, tears or any damage that would compromise its cargo retention capabilities. Structurally serviceable means the bulk container does not have major defects in its structural components, such as top and bottom side rails, top and bottom end rails, door sill and header, floor cross members, corner posts, and corner fittings in a freight container. Major defects include:
  - (a) bends, cracks or breaks in structural or supporting members, or any damage to service or operational equipment that affect the integrity of the container;
  - (b) Any distortion of the overall configuration or any damage to lifting attachments or handling equipment interface features great enough to prevent proper alignment of handling equipment, mounting and securing chassis or vehicle, or insertion into ships' cells; and, where applicable
  - (c) Door hinges, door seals and hardware that are seized, twisted, broken, missing, or otherwise inoperative.

- 4.3.1.16 Before a flexible bulk container is filled it must be visually examined to ensure it is structurally serviceable, its textile slings, load-bearing structure straps, body fabric, lock device parts including metal and textile parts are free from protrusions or damage and that inner liners are free from rips, tears or any damage.
- 4.3.1.16.1 For flexible bulk containers, the period of use permitted for the transport of dangerous goods must be two years from the date of manufacture of the flexible bulk container.
- 4.3.1.16.2 A venting device must be fitted if a dangerous accumulation of gases may develop within the flexible bulk container. The vent must be so designed that the penetration of foreign substances or the ingress of water is prevented under normal conditions of transport.
- 4.3.2 ADDITIONAL PROVISIONS APPLICABLE TO BULK GOODS OF DIVISIONS 4.2, 4.3, 5.1, 6.2 AND CLASSES 7 AND 8**
- 4.3.2.1 Bulk goods of Division 4.2**
- Only closed bulk containers (code BK2) may be used. The total mass carried in a bulk container must be such that its spontaneous ignition temperature is greater than 55 °C.
- 4.3.2.2 Bulk Goods of Division 4.3**
- Only closed bulk containers (code BK2) and flexible bulk containers (code BK3) may be used. These goods must be transported in bulk containers which are waterproof.
- 4.3.2.3 Bulk Goods of Division 5.1**
- Bulk containers must be so constructed or adapted that the goods cannot come into contact with wood or any other incompatible material.
- 4.3.2.4 Bulk goods of Division 6.2**
- 4.3.2.4.1 Bulk Transport of Animal Material of Division 6.2
- Animal material containing infectious substances (UN Nos. 2814, 2900 and 3373) is authorised for transport in bulk containers provided the following conditions are met:
- (a) Sheeted bulk containers BK1 are permitted provided that they are not filled to maximum capacity to avoid substances coming into contact with the sheeting. Closed bulk containers BK2 are also permitted.
  - (b) Closed and sheeted bulk containers, and their openings, must be leak-proof by design or by the fitting of a suitable liner.
  - (c) The animal material must be thoroughly treated with an appropriate disinfectant before loading prior to transport.
  - (d) Sheeted bulk containers must be covered by an additional top liner weighted down by absorbent material treated with an appropriate disinfectant.

- (e) Closed or sheeted bulk containers must not be re-used until after they have been thoroughly cleaned and disinfected.

**NOTE:** *Additional provisions may be required by health or environmental authorities.*

#### 4.3.2.4.2

##### Bulk wastes of Division 6.2 (UN 3291)

- (a) Only closed bulk containers (BK2) are permitted;
- (b) Closed bulk containers, and their openings, must be leakproof by design. These bulk containers must have non porous interior surfaces and must be free from cracks or other features which could damage packagings inside, impede disinfection or permit inadvertent release;
- (c) Wastes of UN No. 3291 must be contained within the closed bulk container in UN type tested and approved sealed leakproof plastics bags tested for solids of packing group II and marked in accordance with 6.1.3.1. Such plastics bags must be capable of passing the tests for tear and impact resistance according to ISO 7765-1:1988 "Plastics film and sheeting. Determination of impact resistance by the free-falling dart method. Part 1: Staircase methods" and ISO 6383-2:1983 "Plastics. Film and sheeting. Determination of tear resistance. Part 2: Elmendorf method". Each bag must have an impact resistance of at least 165 g and a tear resistance of at least 480 g in both parallel and perpendicular planes with respect to the length of the bag. The maximum net mass of each plastics bag must be 30 kg;
- (d) Single articles exceeding 30 kg such as soiled mattresses may be transported without the need for a plastics bag when authorised by the competent authority;
- (e) Wastes of UN 3291 which contain liquids must only be transported in plastics bags containing sufficient absorbent material to absorb the entire amount of liquid without it spilling in the bulk container;
- (f) Wastes of UN 3291 containing sharp objects must only be transported in UN type tested and approved rigid packagings meeting the provisions of packing instructions P621, IBC620 or LP621.
- (g) Rigid packagings specified in packing instructions P621, IBC620 or LP621 may also be used. They must be properly secured to prevent damage during normal conditions of transport. Wastes transported in rigid packagings and plastics bags together in the same closed bulk container must be adequately segregated from each other, e.g. by suitable rigid barriers or dividers, mesh nets or otherwise securing, such that they prevent damage to the packagings during normal conditions of transport;
- (h) Wastes of UN 3291 in plastics bags must not be compressed in a closed bulk container in such a way that bags may be rendered no longer leakproof;
- (i) The closed bulk container must be inspected for leakage or spillage after each journey. If any wastes of UN 3291 have leaked or been spilled in the closed bulk container, it must not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated with an appropriate agent. No other goods must be

transported together with UN 3291 other than medical or veterinary wastes. Any such other wastes transported in the same closed bulk container must be inspected for possible contamination.

#### **4.3.2.5 Bulk material of Class 7**

Reserved

**NOTE:** *The following information from the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) now replaces the information found in earlier editions of the ADG Code.*

[Code for the Safe Transport of of Radioactive Material](#)

*See general comments on page xvi.*

#### **4.3.2.6 Bulk goods of Class 8**

Only closed bulk containers (code BK2) may be used. These goods must be transported in bulk containers which are watertight.

## CHAPTER 4.4: USE OF VEHICLES, TANK VEHICLES, FREIGHT CONTAINERS, EQUIPMENT AND SEGREGATION DEVICES

### 4.4.1

#### GENERAL

A vehicle used to transport dangerous goods:

- (a) must be suitable for transporting the goods;
- (b) must be free of any defect that is likely to create a risk in transporting the goods;
- (c) must be clean;
- (d) in the case of a tank vehicle- must be selected and used in accordance with Section 4.4.2;
- (e) in the case of a road vehicle used to transport a freight container, portable tank or bulk container fitted with corner castings - must be fitted with twistlocks or other equipment for securing a container on a vehicle set out in AS/NZS 3711.10;
- (f) in the case of a road vehicle used to transport a demountable tank or bulk container without corner castings - must be fitted with devices to secure the container;
- (g) in the case of a rail wagon used to transport a freight container, portable tank or bulk container - must be fitted with:
  - (i) twistlocks or other equipment for securing a container on a vehicle set out in AS/NZS 3711.10; or
  - (ii) other fittings that will prevent the movement of the container during transport.

### 4.4.2

#### USE OF TANK VEHICLES

**NOTE 1:** Tank vehicles include road tank vehicles and rail tank wagons. In the case of a road tank vehicle, this includes a vehicle to which a tank, other than a portable tank, is attached. Use of portable tanks must comply with Chapter 4.2.

**NOTE 2:** A tank vehicle does not include a hopper vehicle or any other vehicle into which solid dangerous goods are directly loaded, unless the receptacle is a tank that would also be suitable for use with liquids. Use of hopper vehicles etc. must comply with Chapter 4.3.

#### 4.4.2.1

This Section provides requirements for the use of tank vehicles for the transport of substances of Classes 2, 3, 4, 5, 6, 8 and 9. In addition to these usage requirements, tank vehicles must conform to the design, construction, inspection, testing and approval requirements detailed in Chapter 6.10.

#### 4.4.2.2

Except in accordance with a Competent Authority determination under Regulation 1.5.1(2), dangerous goods must not be transported in a road tank vehicle or rail tank wagon if there is no Portable Tank Instruction allocated to the substance in Column (10) of the Dangerous Goods List in 3.2.3.

#### **4.4.2.3 Vehicle and tank selection**

4.4.2.3.1 Dangerous goods must not be transported in a tank vehicle unless the compliance plate fitted to the vehicle in accordance with 6.10.2.2 indicates that the tank:

- (a) is suitable for the properties of the substance to be transported; and
- (b) has been maintained and tested in accordance with Chapter 6.10.

4.4.2.3.2 Dangerous goods must not be transported in a road tank vehicle unless that vehicle conforms with AS 2809 Part 1 and such other Part of AS 2809 as is applicable to the particular substance, in accordance with Table 6.1 in Chapter 6.10.

#### **4.4.2.4 Condition of container and equipment**

4.4.2.4.1 Dangerous goods must not be transported in a tank vehicle if the tank is:

- (a) constructed of material which is incompatible with the goods; or
- (b) leaking, defective or damaged so that it is not safe to transport the goods; or
- (c) is not free from dangerous goods which are incompatible with the dangerous goods to be transported.

4.4.2.4.2 Every valve, cap, manhole cover or other closure on a tank vehicle transporting dangerous goods as a liquid or a gas, including the receptacle or any associated piping, must be kept closed and secured so as to avoid unsafe loss of containment.

4.4.2.4.3 If a tank vehicle is used to transport dangerous goods that are likely to polymerise or solidify:

- (a) any fittings on the tank or vehicle that are likely to come into contact with the goods (whether in a liquid or vapour state) should not be obstructed by the goods so as to create a risk; and
- (b) any material removed during cleaning operations should be kept wetted or otherwise kept safe until it has been removed to a safe place.

#### **4.4.3 USE OF FREIGHT CONTAINERS**

A freight container used to transport dangerous goods must comply with the relevant Standards specified in Chapter 6.12 and be:

- (a) suitable for transporting the goods; and
- (b) free of any defect that is likely to cause a hazard in transporting the goods; and
- (c) clean and dry on the inside; and
- (d) free of dangerous residues; and
- (e) secured to the vehicle in accordance with Section 8.2.1.

#### **4.4.4 USE OF EQUIPMENT ON VEHICLES**

Any equipment that is on the vehicle and that is to be used in loading dangerous goods onto the vehicle, or unloading dangerous goods from the vehicle must be:

- (a) suitable for the purpose; and
- (b) free of any defect that is likely to increase risk in loading or unloading the goods.

**NOTE:** For equipment used for fluid transfer, see Chapter 10.1.

## **4.4.5 USE OF SEGREGATION DEVICES**

### **4.4.5.1 Application and purpose**

4.4.5.1.1 The use of segregation devices, when permitted by Section 9.2.2, applies only to transport by road and rail within Australia.

4.4.5.1.2 The purpose of a Segregation Device is to provide an additional level of all-round protection to its contents in the event of an abnormal situation. It provides an additional barrier against the contact of incompatibles or the contamination of foodstuffs, etc.

4.4.5.1.3 Subject to Section 9.2.2, dangerous goods of packing group II or III may be segregated from incompatible goods by packing either the dangerous goods or the incompatible goods in a segregation device which may be:

- (a) an Overpacking Drum Segregation Device as described in 6.11.2; or
- (b) a Type I Segregation Device as detailed in 6.11.3; or
- (c) a Type II Segregation Device in accordance with 6.11.4; or
- (d) a Non-Type I Underslung Segregation Device in accordance with 6.11.7

**NOTE:** Other methods of segregation may be permitted by Section 9.2.2.

### **4.4.5.2 Packing and stowage**

4.4.5.2.1 Each dangerous goods package or unpackaged dangerous article that is stowed in a segregation device must be:

- (a) an approved sole package or combination package, packed in accordance with Chapter 4.1, that is labelled and marked in accordance with Chapter 5.2; or
- (b) an unpackaged dangerous article that is labelled and marked in accordance with Chapter 5.2; or
- (c) dangerous goods packed and marked as limited quantities in accordance with Chapter 3.4.

4.4.5.2.2 Each package or article must be stowed in the segregation device so that it will remain in position during transport.

4.4.5.2.3 The segregation device must be restrained on the vehicle or in the freight container so that it will remain in position during transport.

4.4.5.2.4 All other goods on the vehicle or in the freight container must be stowed in the vehicle or container such that they will not be adversely affected in the event of leakage of any goods from the segregation device.

4.4.5.2.5 The dangerous goods and the incompatible goods must not be stowed above each other.

#### **4.4.5.3**

#### **Marking and Labelling**

##### **4.4.5.3.1**

An overpacking drum in which dangerous goods are transported must be marked and labelled as required for an Overpack in Section 5.1.2.

##### **4.4.5.3.2**

Type I and II segregation devices and Non – Type I underslung segregation devices in which dangerous goods are transported must be labelled in accordance with Section 5.2.2.

#### **4.4.5.4**

#### **Non-Type I Underslung Segregation Device**

##### **4.4.5.4.1**

Equipment such as tools or jacks must not be stored in a Non-Type I underslung segregation device at any time while the device contains dangerous goods.

**PART 5**

**CONSIGNMENT PROCEDURES -  
INCLUDING LABELLING, MARKING AND  
PLACARDING**

## CHAPTER 5.1: GENERAL PROVISIONS

### 5.1.1 APPLICATION AND GENERAL PROVISIONS

5.1.1.1 This Part sets forth provisions for dangerous goods consignments relative to preparation of consignments, marking, labelling, and placarding.

### 5.1.1.2 Reserved

### 5.1.2 USE OF OVERPACKS

**NOTE:** *UN23 uses the word “overpack” to describe what was known as a ‘unit load’ in previous editions of this Code. In the UN Model Regulations, the definition of “overpack” restricts its use to a single consignor. This Code omits that restriction for transport within Australia by road or rail, thus permitting packaged dangerous goods to be unitised in accordance with this section by transporters, freight forwarders and load consolidators.*

### 5.1.2.1 Overpack marking

5.1.2.1.1 Unless marks and labels representative of all dangerous goods in the overpack are visible, the overpack must be:

- (a) marked with the word “OVERPACK”. The lettering of the “OVERPACK” mark shall be at least 12 mm high; and
- (b) labelled and marked with the proper shipping name, UN number and other marks, as required for packages by chapter 5.2, for each item of dangerous goods contained in the overpack.

Labelling of overpacks containing radioactive material shall be in accordance with 5.2.2.1.12.

5.1.2.1.2 Despite 5.1.2.1.1, an overpack intended only for transport by road or rail within Australia need not be marked with the word “OVERPACK”.<sup>1</sup>

5.1.2.1.3 Despite 5.1.2.1.1, if marks and labels representative of all dangerous goods in the overpack are not visible, and all of the dangerous goods are limited quantity items, the overpack may be marked with the limited quantity mark specified in Chapter 3.4.

### 5.1.2.2 Package provisions

5.1.2.2.1 Each package of dangerous goods contained in the overpack must comply with all applicable provisions of this Code. The intended function of each package must not be impaired by the overpack.

---

<sup>1</sup> However, ‘OVERPACK’ marking will be required on overpacks transported by sea between Australian ports.

- 5.1.2.2.2 Except for limited quantities where 3.4.5 applies, packages containing dangerous goods which are incompatible may not be transported together in an overpack.
- 5.1.2.2.3 Packages transported in an overpack must be wrapped, strapped or otherwise secured in a manner that minimises the likelihood of damage to the packages during transport.
- 5.1.2.2.4 Paints, Adhesives, Printing Inks and Resin Solutions to which special packing provision PP1 applies (see Packing Instruction P001 in Section 4.1.4) may be transported in inner packagings in an overpack subject to the conditions of PP1.
- 5.1.2.3 Package orientation**
- Each package bearing package orientation marks as prescribed in 5.2.1.7 of this Code and which is overpacked or placed in a large packaging must be oriented in accordance with such marks.
- 5.1.2.4 Overpack provisions**
- 5.1.2.4.1 The overpack must be strong enough to withstand repeated handling.
- 5.1.2.4.2 If the overpack is intended to support overstowage it must be of a shape suitable for this purpose and strong enough to support stacking of other loads of similar density to the height to which they are intended to be stacked during transport.
- 5.1.2.4.3 The materials used to enclose or secure the packages in the overpack must be capable of withstanding exposure to moisture, extremes of temperature, sunlight and minor leakages of substance in the overpack.
- 5.1.2.4.4 The overpack must be suitable for lifting by fork lift truck or other lifting apparatus. If the lifting points are not apparent, they must be marked on the overpack.
- NOTE:** Provision is made for the transport of electric storage batteries in overpacks in Packing Instructions P003, P408, P801 and P903, as referenced from the entries for the particular types of batteries in the Dangerous Goods List.
- 5.1.3 EMPTY PACKAGINGS**
- 5.1.3.1 Other than for Class 7, a packaging which previously contained dangerous goods must be identified, marked and labelled as required for those dangerous goods unless freed from dangerous goods.
- 5.1.3.2 Freight containers, tanks, IBCs, as well as other packagings and overpacks, used for the transport of radioactive material must not be used for the storage or transport of other goods unless decontaminated below the level of 0.4 Bq/cm<sup>2</sup> for beta and gamma emitters and low toxicity alpha emitters and 0.04 Bq/cm<sup>2</sup> for all other alpha emitters.
- 5.1.3.3 Unused pre-labelled dangerous goods packagings should be clearly identified as such on any transport documentation, any outer packaging or the exterior of the cargo transport unit in order to avoid inappropriate emergency response.

#### **5.1.4**

#### **MIXED PACKING**

When two or more dangerous goods are packed within the same outer packaging, the package must be labelled and marked as required for each substance. Subsidiary hazard labels need not be applied if the hazard is already represented by a primary hazard label.

## CHAPTER 5.2: MARKING AND LABELLING

**NOTE:** In addition to the marking and labelling required by this chapter, all placardable units (any receptacle, including an IBC, with a capacity of more than 500 kg(L)) must be placarded with emergency information panels in accordance with Chapter 5.3. Where the proper shipping name, UN number or any label required by this chapter is incorporated in the emergency information panel, the requirement of this chapter for that marking or label are met.

### 5.2.1

### MARKING

#### 5.2.1.1

Unless provided otherwise in this Code, the proper shipping name for the dangerous goods as determined in accordance with 3.1.2 and the corresponding UN number preceded by the letters “UN”, must be displayed on each package. The UN number and the letters “UN” must be at least 12 mm high, except for packages of 30 litres capacity or less or of 30 kg maximum net mass and for cylinders of 60 litres water capacity or less when they must be at least 6 mm in height and except for packages of 5 litres capacity or less or 5 kg maximum net mass when they must be of an appropriate size. In the case of unpackaged articles the mark must be displayed on the article, on its cradle or on its handling, storage or launching device. For goods of Division 1.4, Compatibility Group S, the division and compatibility group letter must also be marked unless the label for 1.4S is displayed. A typical package mark is:

“CORROSIVE LIQUID, ACIDIC, ORGANIC, N.O.S. (Caprylyl chloride)  
UN 3265”

If a size requirement in this clause is inconsistent with a size requirement in Table 5.2, Table 5.2 prevails.

#### 5.2.1.1.1

Unless provided otherwise in this Code (as in 5.2.1.1.2 for imported dangerous goods, Chapter 3.4 for dangerous goods packed in limited quantities), the name and address in Australia of the manufacturer or consignor of the dangerous goods, or their agent must be displayed on each package, IBC, cylinder, pressure drum, tube, MEGC or unpackaged article.

#### 5.2.1.1.2

Clause 5.2.1.1.1 does not apply when the dangerous goods are being transported in a closed freight container that has been imported into, or is to be exported from Australia, if:

- (a) no goods (dangerous or not) have been removed from or added to the freight container since:
  - (i) if imported – its arrival in Australia; or
  - (ii) if to be exported — the load was first consigned for transport to the place from which it is to be exported; and
- (b) the freight container is placarded in accordance with section 5.3.8.

#### 5.2.1.2

All marks required by 5.2.1.1:

- (a) must be readily visible and legible;
- (b) must be able to withstand open weather exposure without a substantial reduction in effectiveness;

- (c) must be displayed on a background of contrasting colour on the external surface of the package;
- (d) must not be located with other package marks that could substantially reduce their effectiveness; and.
- (e) should be in letters and numbers of at least the size specified for the package in Table 5.2 (see 5.2.2.2.1.9).

5.2.1.3 Salvage packagings including large salvage packings and salvage pressure receptacles must additionally be marked with the word “SALVAGE”. The lettering of the “SALVAGE” mark must be at least 12 mm high.

**NOTE:** For marking of overpacks, see 5.1.2.1.

5.2.1.4 Large packagings must be marked on at least two opposing sides.

## 5.2.1.5 Reserved

## 5.2.1.6 Special marking provisions for environmentally hazardous substances.

**NOTE:** The application of 5.2.1.6 is conditional on Australian Special Provision AU01 in Chapter 3.3.3

5.2.1.6.1 Unless otherwise specified in this Code, packages containing environmentally hazardous substances meeting the criteria of 2.9.3 (UN Nos. 3077 and 3082) must be durably marked with the environmentally hazardous substance mark.

5.2.1.6.2 The environmentally hazardous substance mark must be located adjacent to the marks required by 5.2.1.1. The requirements of 5.2.1.2 and 5.2.1.4 must be met.

5.2.1.6.3 The environmentally hazardous substance mark must be as shown in Figure 5.2.2.

**Figure 5.2.2: Environmentally hazardous substance mark**

### Environmentally hazardous substance mark

The mark must be in the form of a square set at an angle of 45 degrees (diamond-shaped). The symbol (fish and tree) must be black on white or suitable contrasting background. The minimum dimensions must be 100 mm x 100 mm and the minimum width of line forming the diamond must

be 2 mm. If the size of the package so requires, the dimensions/line thickness may be reduced, provided the mark remains clearly visible. Where dimensions are not specified, all features must be in approximate proportion to those shown.

**NOTE:** The labelling provisions of 5.2.2 apply in addition to any requirement for packages to bear the environmentally hazardous substance mark.

### 5.2.1.7

#### Orientation arrows

##### 5.2.1.7.1

Except as provided in 5.2.1.7.2:

- (a) Combination packagings having inner packagings containing liquid dangerous goods;
- (b) Single packagings fitted with vents;
- (c) Closed and open cryogenic receptacles intended for the transport of refrigerated liquefied gases; and
- (d) Machinery or apparatus containing liquid dangerous goods when it is required to ensure the liquid dangerous goods remain in their intended orientation (see special provision 301 of chapter 3.3).

must be legibly marked with package orientation arrows which are similar to the illustration shown below or with those meeting the specifications of ISO 780:1997. The orientation arrows must appear on two opposite vertical sides of the package with the arrows pointing in the correct upright direction. They must be rectangular and of a size that is clearly visible commensurate with the size of the package. Depicting a rectangular border around the arrows is optional.

**Figures 5.2.3 and 5.2.4: Orientation arrows**

Two black or red arrows on white or suitable contrasting background

or

The rectangular border is optional

All features must be in approximate proportions shown.

##### 5.2.1.7.2

Orientation arrows are not required on:

- (a) Outer packagings containing pressure receptacles except closed or open cryogenic receptacles;
- (b) Outer packagings containing dangerous goods in inner packagings each containing not more than 120 ml, with sufficient absorbent material between the inner and outer packagings to completely absorb the liquid contents;
- (c) Outer packagings containing Division 6.2 infectious substances in primary receptacles each containing not more than 50 ml;
- (d) Type IP-2, type IP-3, type A, type B(U), type B(M) or type C packages containing Class 7 radioactive material;
- (e) Outer packagings containing articles which are leak-tight in all orientations (e.g. alcohol or mercury in thermometers, aerosols, etc.); or
- (f) Outer packagings containing dangerous goods in hermetically sealed inner packagings each containing not more than 500 ml.

5.2.1.7.3 Arrows for purposes other than indicating proper package orientation must not be displayed on a package marked in accordance with this sub-section.

## **5.2.1.8 Excepted Quantities Mark**

Packages containing excepted quantities of dangerous goods must be marked according to 3.5.4

## **5.2.1.9 Lithium or sodium ion battery mark**

5.2.1.9.1 Packages containing lithium or sodium ion cells or batteries prepared in accordance with special provision 188 must be marked as shown in Figure 5.2.5.

5.2.1.9.2 The mark must indicate the UN number preceded by the letters "UN", i.e. 'UN 3090' for lithium metal cells or batteries or 'UN 3480' for lithium ion cells or batteries, or 'UN 3551' for sodium ion cells or batteries. Where the lithium cells or batteries are contained in, or packed with, equipment, the UN number, preceded by the letters "UN", i.e. 'UN 3091' or 'UN 3481' or 'UN 3552' as appropriate shall be indicated. Where a package contains lithium cells or batteries assigned to different UN numbers, all applicable UN numbers shall be indicated on one or more marks.

**Figure 5.2.5: Lithium or sodium ion battery mark**

Minimum dimension 100 mm x 100 mm

\* Place for UN number(s)

The mark must be in the form of a rectangle or a square with hatched edging. The dimensions must be a minimum of 100 mm wide x 100 mm high and the minimum width of the hatching must be 5 mm. The symbol (group of batteries, one damaged and emitting flame, above the UN number (s)) must be black on white or suitable contrasting background. The hatching must be red. If the size of the package so requires, the dimensions may be reduced to not less than 100 mm wide x 70 mm high. Where dimensions are not specified, all features must be in approximate proportion to those shown.

**NOTE:** The mark shown in Figure 5.2.5 in 5.2.1.9 of edition 7.7 of the Code may continue to be used until 31 December 2026.

## 5.2.2

## LABELLING

### 5.2.2.1

### Labelling provisions

**NOTE:** These provisions relate essentially to danger labels. However, additional marks or symbols indicating precautions to be taken in handling or storing a package (e.g. a symbol representing an umbrella indicating that a package must be kept dry) may be displayed on a package if appropriate.

#### 5.2.2.1.1

All dangerous goods packages, cylinders, pressure drums, tubes, MEGCs, IBCs, overpacks and unpackaged articles that are subject to this Code must have a label that identifies the primary and subsidiary hazards of the dangerous goods and that conforms to models Nos. 1 to 9 illustrated in 5.2.2.2.2, except:

- (a) those IBCs, pressure drums, tubes and MEGCs which are placardable units that are placarded with emergency information panels in accordance with Chapter 5.3; or
- (b) where there is an exemption from labelling in an applicable Special Provision in Chapter 3.3; or

- (c) for dangerous goods in limited quantities that are packed and marked in accordance with Chapter 3.4; or

For the purposes of this provision, the “EXPLOSIVE” subsidiary hazard label is model No. 1.

#### 5.2.2.1.2

Where articles or substances are specifically listed in the Dangerous Goods List, a danger class label must be affixed for the hazard shown in Column 3. A subsidiary hazard label must also be affixed for any hazard indicated by a class or division number in Column 4 of the Dangerous Goods List. However, special provisions indicated in Column 6 may also require a subsidiary hazard label where no subsidiary hazard is indicated in Column 4 or may exempt from the requirement for a subsidiary hazard label where such a hazard is indicated in the Dangerous Goods List.

#### 5.2.2.1.3

Except as provided in 5.2.2.1.3.1, if a substance which meets the definition of more than one class is not specifically listed by name in the Dangerous Goods List in chapter 3.2, the provisions in chapter 2.0 must be used to determine the primary hazard class of the goods. In addition to the label required for that primary hazard class, subsidiary hazard labels must also be applied as specified in the Dangerous Goods List.

#### 5.2.2.1.3.1

Packages containing substances of Class 8 need not bear subsidiary hazard label model No. 6.1 if the toxicity arises solely from the destructive effect on tissue. Packages containing substances of Division 4.2 need not bear subsidiary hazard label model No. 4.1.

#### 5.2.2.1.4

Labels for Class 2 gases with subsidiary hazard(s)

**Table 5.2.2.1.4: Labels for Class 2 Gases With Subsidiary Hazard(s)**

| Division           | Subsidiary hazard(s) shown in chapter 2.2 | Primary hazard label | Subsidiary hazard label(s) |
|--------------------|-------------------------------------------|----------------------|----------------------------|
| 2.1                | None                                      | 2.1                  | None                       |
| 2.2                | None                                      | 2.2                  | None                       |

| Table note:        |                                           |                      |                            |
| a. See 5.2.2.1.5.1 |                                           |                      |                            |

- 5.2.2.1.5 Three separate labels have been provided for Class 2, one for flammable gases of Division 2.1 (red), one for non-flammable, non-toxic gases of Division 2.2 (green) and one for toxic gases of Division 2.3 (white). Where the Dangerous Goods List indicates that a Class 2 gas possesses single or multiple subsidiary hazards, labels must be used in accordance with the table in 5.2.2.1.4.
- 5.2.2.1.5.1 For the labelling of cylinders containing UN 1070 Nitrous Oxide or UN 1072 Oxygen, and any other gases of Division 2.2 that have a Subsidiary Hazard of 5.1, a yellow "OXIDISING GAS" label (model No. 2.5) may be used In lieu of Division 2.2 plus Subsidiary hazard 5.1 labels.
- NOTE:** *The use of the oxidising gas label is valid for road or rail transport in Australia. It may not be accepted internationally, or for sea or air transport within Australia.*
- 5.2.2.1.6 Except as provided in 5.2.2.2.1.2, each label must:
- (a) be located on the same surface of the package near the proper shipping name mark, if the package dimensions are adequate; and
  - (b) be so placed on the packaging that they are not covered or obscured by any part or attachment to the packaging or any other label or mark; and
  - (c) when primary and subsidiary hazard labels are required, be displayed next to each other.
- Where a package is of such an irregular shape or small size that a label cannot be satisfactorily affixed, the label may be attached to the package by a securely affixed tag or other suitable means.
- 5.2.2.1.7 Reserved
- 5.2.2.1.8 Labels must be affixed on a surface of contrasting colour, or must have either a dotted or solid outer boundary line.
- 5.2.2.1.9 Special provisions for the labelling of self-reactive substances
- An "EXPLOSIVE" subsidiary hazard label (model No. 1) must be applied for type B self-reactive substances, unless the competent authority has exempted a specific packaging from this label because test data have proved that the self-reactive substance in such a packaging does not exhibit explosive behaviour.
- 5.2.2.1.10 Special provisions for the labelling of organic peroxides
- The Division 5.2 label (model No. 5.2) must be affixed to packages containing organic peroxides classified as types B, C, D, E or F. This label also implies that the product may be flammable and hence no "FLAMMABLE LIQUID", subsidiary hazard label (model No. 3) is required. In addition, the following subsidiary hazard labels must be applied:
- (a) an "EXPLOSIVE" subsidiary hazard label (model No. 1) for organic peroxides type B, unless the competent authority has exempted a specific packaging from this label because test data have proved that the organic peroxide in such a packaging does not exhibit explosive behaviour;

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                | (b) a “CORROSIVE” subsidiary hazard label (model No. 8) is required when packing group I or II criteria of Class 8 are met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 5.2.2.1.11     | <p>Special provisions for the labelling of infectious substances packages</p> <p>In addition to the primary hazard label (model No. 6.2), infectious substances packages must bear any other label required by the nature of the contents.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 5.2.2.1.12     | <p>Reserved</p> <p><b>NOTE:</b> <i>The requirement to label inner packages has been removed in lieu of GHS requirements.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 5.2.2.1.13     | Labels for articles containing dangerous goods transported as UN Nos. 3537, 3538, 3539, 3540, 3541, 3542, 3543, 3544, 3545, 3546, 3547 and 3548                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 5.2.2.1.13.1   | Packages containing articles or articles transported unpackaged shall bear labels according to 5.2.2.1.2 reflecting the hazards established according to 2.0.5. If the article contains one or more lithium or sodium ion batteries with, for lithium metal batteries, an aggregate lithium content of 2 g or less, and for lithium ion or sodium ion batteries, a watt-hour rating of 100 Wh or less, the lithium or sodium ion battery mark (Figure 5.2.5) shall be affixed to the package or unpackaged article. If the article contains one or more lithium or sodium ion batteries with, for lithium metal batteries, an aggregate lithium content of more than 2 g and for lithium ion or sodium ion batteries, a watt-hour rating of more than 100 Wh, the battery label (5.2.2.2.2 No. 9A) shall be affixed to the package or unpackaged article. |
| 5.2.2.1.13.2   | When it is required to ensure articles containing liquid dangerous goods remain in their intended orientation, orientation marks meeting 5.2.1.7.1 must be affixed and visible on at least two opposite vertical sides of the package or of the unpackaged article where possible, with the arrows pointing in the correct upright direction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 5.2.2.1.14     | <p>Labelling of segregation devices</p> <p>Type I and II segregation devices and Non - Type I underslung segregation devices in which dangerous goods are transported in accordance with Section 4.4.5 must be labelled on each vertical side that may be exposed during loading or transport with labels in accordance with subsection 5.2.2.1, except that each label must be at least 250 mm square.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>5.2.2.2</b> | <b>Provisions for labels</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 5.2.2.2.1      | <p>Labels must satisfy the provisions of this section and conform, in terms of colour, symbols and general format, to the specimen labels shown in 5.2.2.2.2, except as provided in 5.2.2.2.1.5.</p> <p><b>NOTE:</b> <i>Where appropriate, labels in 5.2.2.2.2 are shown with a dotted outer boundary as provided for in 5.2.2.2.1.1. This is not required when the label is applied on a background of contrasting colour.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5.2.2.2.1.1    | <p>Labels must be configured as shown in figure 5.2.6.</p> <p>Figure 5.2.6: Class / Division Label</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

\* The class or, for divisions 5.1 and 5.2, the Division number must be shown in the bottom corner.

\*\* Additional text/numbers/symbol/letters must (if mandatory) or may (if optional) be shown in this bottom half.

\*\*\* The class or division symbol or, for divisions 1.4, 1.5 and 1.6, the division number and for Model No 7E the word “FISSILE” must be shown in the top half.

#### 5.2.2.2.1.1.1

Labels must be displayed on a background of contrasting colour, or must have either a dotted or solid outer boundary line.

#### 5.2.2.2.1.1.2

The label must be in the form of a square set at an angle of 45 degrees (diamond-shaped). The minimum dimensions must be 100 mm x 100 mm. There must be a line inside the edge forming the diamond which must be parallel and approximately 5 mm from the outside of that line to the edge of the label.”.

#### 5.2.2.2.1.1.3

If the size of the package so requires the dimensions may be reduced proportionally, provided the symbols and other elements of the label remain clearly visible. Dimensions for cylinders must comply with 5.2.2.2.1.2.

#### 5.2.2.2.1.2

Cylinders for Class 2 may, on account of their shape, orientation and securing mechanisms for transport, bear labels representative of those specified in this section, which have been reduced in size, according to ISO 7225:2005<sup>1</sup> “Gas cylinders – Precautionary labels”, for display on the non-cylindrical part (shoulder) of such cylinders. Labels may overlap to the extent provided for by ISO 7225:2005, however, in all cases, the labels representing the primary hazard and the numbers appearing on any label must remain fully visible and the symbols recognisable.

**NOTE:** When the diameter of the cylinder is too small to permit the display of the reduced size labels on the non-cylindrical upper part of the cylinder, the reduced sized labels may be displayed on the cylindrical part.

<sup>1</sup> The minimum sizes for labels specified by ISO 7225 are included in Table 5.2.

- 5.2.2.2.1.3 With the exception of Divisions 1.4, 1.5 and 1.6, the upper half of the label must contain the pictorial symbol and the lower half must contain the class or division number (and for goods of Class 1, the compatibility group letter) as appropriate. However, for label model No. 9A, the upper half of the label shall only contain the seven vertical stripes of the symbol and the lower half shall contain the group of batteries of the symbol and the class number. Except for label model No. 9A, the label may include such text as the UN number, or words describing the hazard class (e.g. “flammable”) in accordance with 5.2.2.2.1.5 provided that the text does not obscure or detract from the other required label elements.
- 5.2.2.2.1.4 In addition, except for Divisions 1.4, 1.5 and 1.6, labels for Class 1 must show in the lower half, above the class number, the division number and compatibility group letter for the substance or article. Labels for Divisions 1.4, 1.5 and 1.6 must show in the upper half the division number and in the lower half the class number and the compatibility group letter. For Division 1.4, Compatibility Group S, no label is generally required. However, in cases where a label is considered necessary for such goods, it should be based on model No. 1.4.
- 5.2.2.2.1.5 On labels other than those for material of Class 7, the insertion of any text (other than the class or division number) in the space below the symbol must be confined to particulars indicating the nature of the hazard and precautions to be taken in handling. In this Code, text indicating the nature of the risk (e.g. “FLAMMABLE GAS”, or “CORROSIVE”), is depicted on all specimen labels in 5.2.2.2.2. This text must be included on labels for material of Class 7 and on label model No. 2.5, and should be included on the other labels where practicable. For label 9A, no text other than the class mark must be included in the bottom part of the label.
- NOTE 1:** *In UN23, the IMDG Code, ICAO Rules, IATA Regulations, ADR and RID, text indicating the nature of the risk, while permitted, is not included in the illustrated labels other than those for material of Class 7. Often therefore labels on imported packages and IBCs, or used as placards on imported freight containers or portable tanks, will not incorporate text indicating the nature of the risk, or may incorporate this text in another language. Such labels are acceptable for continued transport within Australia. Text is more frequently omitted where the UN number is incorporated in a label used as a placard as shown in Figure 5.3.3.*
- NOTE 2:** *Notwithstanding Note 1, the continuing display on labels of text indicating the nature of the risk is strongly encouraged for use within Australia, particularly when used as placards on vehicles and freight containers, to assist with hazard recognition in an emergency.*
- 5.2.2.2.1.6 The symbols, text and numbers must be shown in black on all labels except for:
- (a) the Class 8 label, where the text (if any) and class number must appear in white;
  - (b) labels with entirely green, red or blue backgrounds where they may be shown in white;

- (c) the Division 5.2 label, where the symbol may be shown in white; and
- (d) the Division 2.1 label displayed on cylinders and gas cartridges for liquefied petroleum gases, where they may be shown in the background colour of the receptacle if adequate contrast is provided.

5.2.2.2.1.7

All labels must be able to withstand open weather exposure without a substantial reduction in effectiveness.

5.2.2.2.1.8

Where the colour orange, red, green, blue or yellow is specified for use in labels in 5.2.2.2 or in placards in Chapter 5.3, the colour of the label or placard must be the relevant colour as displayed and identified in Figure 5.3.7 (at the end of Chapter 5.3).

5.2.2.2.1.9

Where the size of a package is such that it is impracticable to apply a label of 100 mm x 100 mm as required by 5.2.2.2.1.1, the label must be of at least the dimensions specified for the package in Table 5.2. In each instance, the minimum dimensions apply to each side of the outer border set at 45°.

#### 5.2.2.2.3

#### Mixed Class Label

**NOTE:** The Mixed Class Label is used as a placard on cargo transport units transporting more than one class or division of dangerous goods, or a load that requires placarding based on the combined quantity calculation specified in Note 5 of Table 5.3. It is not a package label.

The Mixed Class Label depicted here is not part of the UN labelling system and is not included in the modal codes. Its use as a transport placard and is therefore valid only for road or rail transport within Australia.

**Figure 5.2.7: Mixed load label**

#### 5.2.2.2.4

##### Limited Quantity Label

- (a) The Limited Quantity Label or Mark's use is described in 3.4.
- (b) It is the applicable placard for cargo transport units transporting a placard load of limited quantities and/or domestic consumable dangerous goods that meet the requirements of Chapter 3.4

**Figure 5.2.8: Limited Quantity label**

mond

(also referred to as a  
Limited Quantity Placard)

(Model No. 11)

## CHAPTER 5.3: PLACARDING AND MARKING OF CARGO TRANSPORT UNITS, PLACARDABLE UNITS AND BULK CONTAINERS

### Introductory Note

Section 5.3.1 Details the placarding requirements applicable to all cargo transport units, bulk containers and placardable units and provides the specifications for placards.

Section 5.3.2 Specifies additional marking that is required on some cargo transport units, bulk containers or placardable units when they contain particular loads of dangerous goods.

Sections 5.3.3–5.3.9 Specify detailed placarding requirements for different types of cargo transport units, bulk containers, placardable units and loads.

### 5.3.1 GENERAL PLACARDING REQUIREMENTS

#### 5.3.1.1 Placarding Principles

5.3.1.1.1<sup>1</sup> Placards must be affixed to the exterior surface of cargo transport units that contain a placard load of dangerous goods as determined from Table 5.3, and to bulk containers and placardable units. A placard warns others that the cargo transport unit contains dangerous goods and it presents risks.

| <b>Table 5.3: Placard Load (Minimum Quantities)</b>                      |                                                                                                                        |                                                                                                                |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| (A placard load is defined in 1.2.1.1)                                   |                                                                                                                        |                                                                                                                |
| Note: the load must be assessed against both Table 5.3.1 and Table 5.3.2 |                                                                                                                        |                                                                                                                |
| Table 5.3.1 – Dangerous goods not transported under Chapter 3.4          |                                                                                                                        |                                                                                                                |

| <p><b>NOTE 1:</b> For placarding quantities of Class 1, see the Australian Explosives Code.</p> <p><b>NOTE 2:</b> For placarding quantities of Class 7, see the Codes of Practice for the Safe Transport of Radioactive Substances.</p> <p><b>NOTE 3:</b> A Fumigated Unit (UN 3359) complying with Chapter 5.5 that does not contain any other dangerous goods is not a placard load and should not be included in the aggregate quantity of dangerous goods when determining a placard load.</p> <p><b>NOTE 4:</b> For land transport wholly within Australia, this Code requires placards to be displayed on cargo transport units if they contain a placard load, as determined from Table 5.3. It should be noted that cargo transport units containing lesser quantities may need to be placarded in accordance with the IMDG Code before they are acceptable for transport by sea, even within Australian waters.</p> <p><b>NOTE 5:</b> When transporting a load that contains dangerous goods specified in (b) or (e) of Table 5.3.1 and dangerous goods specified in (g) of Table 5.3.2, each of which are below a placard load, the combined quantity of dangerous goods in the load must be calculated and the result assessed against the relevant threshold in Table 5.3.1.</p> <p><b>Calculation of combined quantity</b></p> <p>If the relevant threshold for the dangerous goods in Table 5.3.1 is (b) - the combined quantity = the aggregate qty regulated DG + 10% of the Gross weight of the LQ/DC; or</p> <p>If the relevant threshold for the dangerous goods in Table 5.3.1 is (e) - the combined quantity = the aggregate qty regulated DG + 25% of the Gross weight of the LQ/DC</p> |                                                                                                                                                 |                                                                                                                                                                                                                         |

- 5.3.1.1.2 Placards must correspond to the primary hazard of the goods contained in the cargo transport unit, bulk container or placardable unit except that:
- (a) placards are not required on cargo transport units carrying any quantity of explosives of Division 1.4, Compatibility Group S, unless they are also carrying other dangerous goods; and
  - (b) where the load is a placard load under Table 5.3.1 and there is more than one class or division in a cargo transport unit, a placard in the form of a mixed class label (model No. 10 in 5.2.2.2.3) may be used in lieu of multiple placards where permitted in Sections 5.3.3 to 5.3.7 inclusive.
  - (c) where the load is a placard load under Table 5.3.2, the cargo transport unit must be placarded with a limited quantity label (model No. 11 in 5.2.2.2.4)
  - (d) where the cargo transport unit requires placarding under both Table 5.3.1 and Table 5.3.2, it must be placarded with both labels.
  - (e) where the load is a placard load based on the calculation in Table 5.3, Note 5, the cargo transport unit must be placarded with a mixed class label (model No. 10 in 5.2.2.2.3) and the calculation shown on the dangerous goods transport document.
- NOTE:** *The use of the mixed class label as a placard is valid only in Australia, for road or rail transport.*
- 5.3.1.1.3 Placards must also be displayed for those subsidiary hazards for which a subsidiary hazard label is required according to 5.2.2.1.2. However, cargo transport units containing goods of more than one class or division need not bear a subsidiary hazard placard if the hazard represented by that placard is already indicated by a primary hazard placard or where a mixed class placard is displayed where permitted in this chapter.
- 5.3.1.1.4 Placards must be displayed on:
- (a) all placardable units containing dangerous goods or the residue of dangerous goods, in accordance with Section 5.3.3; and
  - (b) portable tanks and bulk containers containing dangerous goods or the residue of dangerous goods, in accordance with Section 5.3.4; and
  - (c) freight containers containing a placard load of dangerous goods for transport, in accordance with Section 5.3.5; and
  - (d) road vehicles transporting a placard load of dangerous goods, in accordance with Section 5.3.6; and
  - (e) rail wagons transporting a placard load of dangerous goods, in accordance with Section 5.3.7.
- 5.3.1.1.5 Reserved
- 5.3.1.1.6 If a class or division label is incorporated in an emergency information panel displayed on a face of a cargo transport unit in accordance with this Chapter, the cargo transport unit need not on that face display additional placards for the hazard represented by that label for any other goods in the cargo transport unit.

### 5.3.1.2 Specifications for placards

- 5.3.1.2.1 Except as provided in 5.3.1.2.2 for the Class 7 placard, and in 5.3.2.3.2 for the environmentally hazardous substance mark a placard must be configured as shown in figure 5.3.0.

**Figure 5.3.0: Specimen for placards**

Placard (except for class 7)

The placard must be in the form of a square set at an angle of 45 degrees (diamond-shaped). The minimum dimensions must be 250 mm x 250 mm (to the edge of the placard). The line inside the edge must be parallel and 12.5 mm from the outside of that line to the edge of the placard. The symbol and line inside the edge must correspond in colour to the label for the class or division of the dangerous goods in question. The class or division symbol/numeral must be positioned and sized in proportion to those prescribed in 5.2.2.2 for the corresponding class or division of the dangerous goods in question. The placard must display the number of the class or division (and for goods in Class 1, the compatibility group letter) of the dangerous goods in question in the manner prescribed in 5.2.2.2 for the corresponding label, in digits not less than 25 mm high. Where dimensions are not specified, all features must be in approximate proportion to those shown.

- 5.3.1.2.2 Placard for radioactive material of Class 7

For Class 7, the placard must have minimum overall dimensions of 250 mm by 250 mm (except as permitted by 5.3.1.1.5.2 of UN21 with a black line running 5 mm inside the edge and parallel with it, and must be otherwise as shown in figure 5.3.1 below. When different dimensions are used, the relative proportions must be maintained. The number “7” must not be less than 25 mm high. The background colour of the upper half of the placard must be yellow and of the lower half white, the colour of the trefoil and the printing must be black. The use of the word “RADIOACTIVE” in the bottom half is optional to allow the use of this

placard to display the appropriate United Nations number for the consignment.

**NOTE:** 5.3.1.2.2 and Figure 5.3.1 are reproduced from UN23 for information only.

**Figure 5.3.1: Placard for radioactive material of Class 7(No. 7D)**

Symbol (trefoil): black;  
Background: upper half yellow with white border, lower half white;  
The lower half must show the word RADIOACTIVE; or alternatively, when required (see 5.3.2.1), the appropriate UN number; and the figure “7” in the bottom corner

### 5.3.1.3

#### Emergency Information Panels

The loads that require an Emergency Information Panel are defined in Sections 5.3.3 to 5.3.8.

#### 5.3.1.3.1

An emergency information panel is a placard that is substantially of the colour (unless otherwise exempted by the Competent Authority), format and design specified in Figure 5.3.2 and that, except as provided in 5.3.1.3.2, 5.3.1.3.3 and 5.3.1.3.4, includes the following particulars:

- (a) in space (a)
  - the proper shipping name for the dangerous goods being transported; except that where the proper shipping name includes the expression “N.O.S.”, that expression and the names of substances which contribute to the hazard of the goods may be omitted;
- (b) in space (b)
  - the UN Number for the dangerous goods;
- (c) in space (c)
  - any Hazchem Code assigned to the dangerous goods in Appendix C;
- (d) in space (d)
  - the expression: “IN EMERGENCY DIAL 000, POLICE or FIRE BRIGADE”;
- (e) in space (e)

- the class or division label for the dangerous goods and any subsidiary hazard label or labels applicable to the dangerous goods;

(f) in space (f)

- the name of an organisation responsible for providing the telephone advisory service, and a telephone number of the service, including (STD) area code,

**NOTE:** Figure 5.3.2 is in three parts as follows:

- Figure 5.3.2(a) shows the layout and dimensions of an emergency information panel;
- Figure 5.3.2(b) is an example of a completed emergency information panel;
- Figure 5.3.2(c) provides examples of a completed emergency information panel for substances having one or more subsidiary hazards.

#### 5.3.1.3.2

##### Multi-load Emergency Information Panel

A multi-load emergency information panel is a placard substantially of the colour (unless otherwise exempted by the Competent Authority), format and design specified in Figure 5.3.2 that includes the following particulars:

(a) in space (a)

- nothing, the space is to be left blank;

(b) in space (b)

- the expression “MULTI-LOAD”;

(c) in space (c)

- the multi-load Hazchem Code ascertained in accordance with Appendix C for the combination of the dangerous goods being transported in the cargo transport unit or placardable unit;

(d) in space (d)

- the expression: “In emergency dial 000, POLICE or FIRE BRIGADE”;

(e) in space (e):

(i) if the dangerous goods all belong to the same class or division:

- the label appropriate to that class or division; or

(ii) if the dangerous goods do not all belong to the same class or division

- the mixed class label (Model No. 10 in 5.2.2.2.3);

(f) in space (f)

- - the name of an organisation responsible for providing the telephone advisory service and a telephone number of the service, including (STD) area Code.

#### 5.3.1.3.3

##### Mixed Load (Refined Petroleum Product) Emergency Information Panel

A mixed load (refined petroleum product) emergency information panel, the use of which is subject to the conditions of 3.2.5.4, is a placard substantially of the colour (unless otherwise exempted by the Competent

Authority), format and design specified in Figure 5.3.2 that includes the following particulars:

- (a) in space (a)
  - the expression “PETROLEUM FUEL”; or
  - if ethanol is included on the vehicle the following expressions may also be used: PETROL AND ETHANOL / PETROL MIXTURE or DIESEL AND ETHANOL / PETROL MIXTURE or PETROLEUM FUEL AND ETHANOL / PETROL MIXTURE
- (b) in space (b)
  - the expression “1270”
  - for PETROL AND ETHANOL / PETROL MIXTURE “1203 / 3475”
  - for PETROLEUM FUEL AND ETHANOL / PETROL MIXTURE “1270 / 3475”
- (c) in space (c)
  - the multi-load Hazchem Code ascertained in accordance with Appendix C for the combination of the dangerous goods being transported in the cargo transport unit or placardable unit;

**NOTE:** *If ethanol is on the load the ethanol specific Hazchem code must be used*
- (d) in space (d)
  - the expression: “In emergency dial 000, POLICE or FIRE BRIGADE”;
- (e) in space (e)
  - a Class 3 label (model No. 3, see 5.2.2.2.2);
- (f) in space (f)
  - the name of an organisation responsible for providing the telephone advisory service and a telephone number of the service, including (STD) area Code.

#### 5.3.1.3.4

Emergency Information Panel for Unodourised LP Gas, Butane or Propane

Where an emergency information panel is required by this Code for a portable tank, tank vehicle or placardable unit that contains the following substances, the following particulars must be included:

|                                                                  | Unodourised LP gas                               | Unodourised Butane                               | Unodourised Propane                                |
|------------------------------------------------------------------|--------------------------------------------------|--------------------------------------------------|----------------------------------------------------|
| in space (a) in lieu of the proper shipping name, the expression | “UNODOURISED LP GAS” or<br>“LP GAS, UNODOURISED” | “UNODOURISED BUTANE” or<br>“BUTANE, UNODOURISED” | “UNODOURISED PROPANE” or<br>“PROPANE, UNODOURISED” |
| in space (b), the expression                                     | “1075”                                           | “1011”                                           | “1978”                                             |

**NOTE:** *UNODOURISED*” may alternatively be spelled ‘UNODOURIZED’ In all other respects, the emergency information panel must comply with 5.3.1.3.1.

**NOTE:** *The transport of unodourised LP Gas, Butane and Propane are subject to Special Provision AU03 in Chapter 3.3.*

- 5.3.1.3.5 Dimensions of an Emergency Information Panel  
Except where permitted by Section 5.3.3, an emergency information panel must be of the dimensions specified in Figure 5.3.2.
- 5.3.1.3.6 Dividing an Emergency Information Panel  
If, because of an obstruction on the vehicle, container or unit, it is not reasonably practicable to mount an emergency information panel as a whole, the panel may be divided vertically into two parts and mounted on either side of the obstruction.
- 5.3.1.4 Placarding Methods**
- 5.3.1.4.1 If a cargo transport unit, bulk container or placardable unit must be placarded, the placard must be displayed in a substantially vertical plane and:  
(a) securely fixed to the unit; or  
(b) stencilled onto or printed on the unit; or  
(c) placed securely in a frame that is securely fixed to the unit.
- 5.3.1.4.2 The placard must:  
(a) be durable and weather resistant; and  
(b) have letters and numerals that are legible; and  
(c) not be obscured.
- 5.3.1.4.3 The part of the unit immediately behind the placard must be of a contrasting colour to the colour of the placard unless:  
(a) the border of the placard is of a contrasting colour and design; or  
(b) the placard is a label having a dotted or solid outer boundary line in accordance with 5.2.2.2.1.1.

## 5.3.2

## MARKING

### 5.3.2.1

### Display of UN numbers

The requirements of this sub-section 5.3.2.1 do not apply to consignments of dangerous goods being transported only by road or rail within Australia.

**NOTE:** 5.3.2.1 is a requirement of UN23, the IMDG Code, ICAO Rules and IATA Regulations and therefore applies to all transport by sea and air. It is included here for the information of exporters or those intending to transport dangerous goods domestically by sea or air, and to assist in interpreting placarding and marking of containers arriving by sea or air.

#### 5.3.2.1.1

For transport by sea or air, the IMDG Code, ICAO Rules and IATA Regulations require that, except for goods of Class 1, the UN number must be displayed as required by this section on consignments of:

- (a) solids, liquids or gases transported in tank cargo transport units including on each component of a multi-compartment tank cargo transport unit;
- (b) solids in bulk containers;
- (c) packaged dangerous goods of a single commodity which constitute a full load for the cargo transport unit;
- (d) unpackaged LSA-I material, SCO-I or SCO-III of Class 7 in or on a vehicle, or in a freight container, or in a tank; and
- (e) packaged radioactive material with a single UN number in or on a vehicle, or in a freight container, when required to be transported under exclusive use.

#### 5.3.2.1.2

When required for intermodal transport, the UN number for the goods must be displayed in black digits not less than 65 mm high, either:

- (a) against a white background in the area below the pictorial symbol and above the class or division number and the compatibility group letter in a manner that does not obscure or detract from the other required label elements; or
- (b) on an orange rectangular panel not less than 120 mm high and 300 mm wide, with a 10 mm black border, to be placed immediately adjacent to each placard. For portable tanks with a capacity of not more than 3000 litres and with an available surface area insufficient to affix the prescribed placards the UN number may be displayed on an orange rectangular panel of appropriately reduced size on the external surface of the tank in characters not less than 25 mm high.

#### 5.3.2.1.3

Examples of display of UN numbers

**Figure 5.3.3(b)**

\* location of class or division number

\*\* location of UN number

Completed examples for UN 1300 TURPENTINE SUBSTITUTE

## 5.3.2.2 Elevated temperature substance mark

- 5.3.2.2.1 Cargo transport units containing a substance that is transported or offered for transport in a liquid state at a temperature equal to or exceeding 100 °C, in a solid state at a temperature equal to or exceeding 240 °C must bear on each side and on each end the mark shown in figure 5.3.4.
- 5.3.2.2.2 Despite 5.3.2.2.1, where the prescribed mark for carriage at elevated temperature is incorporated as a subsidiary hazard label in an emergency information panel, the sides of the triangle must measure at least 150 mm.

**Figure 5.3.4: Mark for carriage at elevated temperature**

The mark must be an equilateral triangle. The colour of the mark must be red. The minimum dimension of the sides must be 250 mm. For portable tanks with a capacity of not more than 3 000 litres and with an available surface area insufficient to affix the prescribed marks, the minimum dimensions of the sides may be reduced to 100 mm. Where dimensions are not specified, all features must be in approximate proportion to those shown.

## 5.3.2.3 Environmentally hazardous substance mark

- 5.3.2.3.1 Subject to Special Provision AU01 in Chapter 3.3, a cargo transport unit or bulk container containing environmentally hazardous substances meeting the criteria of 2.9.3 (UN Nos. 3077 and 3082) must be marked with the environmentally hazardous substance mark (Figure 5.2.2). The mark must be placed on each surface of the cargo transport unit or bulk container that is required by this Chapter to be placarded, as near as is practicable to the class or division label.
- 5.3.2.3.2 The environmentally hazardous substance mark for cargo transport units and bulk containers must be as described in 5.2.1.6.3 and figure 5.2.2, except that the minimum dimensions must be 250 mm x 250 mm. For portable tanks with a capacity of not more than 3 000 litres and with an available surface area insufficient to affix the prescribed marks, the minimum dimensions may be reduced to 100 mm x 100 mm.
- 5.3.2.3.3 If the environmentally hazardous substance mark is incorporated in an emergency information panel, the sides of the mark must measure at least 150 mm.

### 5.3.3

### PLACARDING PLACARDABLE UNITS

#### 5.3.3.1

Except as provided in 5.3.3.6, this section applies to placardable units, being all receptacles, other than cargo transport units, that have a capacity > 500 kg(L), including:

- (a) IBCs;
- (b) pressure drums;
- (c) tubes;
- (d) MEGCs;
- (e) demountable tanks.

#### 5.3.3.2

A placardable unit that contains dangerous goods, or has contained dangerous goods and is not free from dangerous goods, must be placarded with emergency information panels as specified in 5.3.1.3.

#### 5.3.3.3

Except where 5.3.3.4 applies, two emergency information panels must be displayed in accordance with 5.3.1.4, in a substantially vertical plane. Panels should, where practicable, be displayed on opposite sides, so as to be best seen:

- (a) from a forklift when approaching to pick up the unit; and
- (b) when loaded onto a vehicle.

#### 5.3.3.4

Despite 5.3.3.3, only one emergency information panel is required on pressure drums, tubes and other placardable units having a diameter or side dimension of less than 1 metre.

#### 5.3.3.5

Despite 5.3.1.3.5, if a placardable unit has a capacity of not more than 3 cubic metres, an emergency information panel fixed to the unit may have dimensions not less than half those shown in Figure 5.3.2<sup>1</sup> in which case the size of each label and the height of lettering and numerals on the panel must be reduced in proportion to the reduced dimensions of the panel.

### 5.3.3.6

### Exception to placarding with EIPs

This section 5.3.3 does not apply to a placardable unit that is being transported in a closed freight container that has been imported into, or is to be exported from Australia, if:

- (a) the placardable unit is marked and labelled in accordance with the applicable modal code (IMDG Code, ICAO Rules or IATA Regulations);
- (b) the freight container is placarded in accordance with the applicable modal code (IMDG Code, ICAO Rules or IATA Regulations); and
- (c) no goods (dangerous or not) have been removed from or added to the freight container since:
  - (i) if imported:
    - its arrival in Australia; or
  - (ii) if to be exported:

---

<sup>1</sup>An Emergency Information Panel printed on an A3 sheet with minimum printing margins all round is deemed to meet this minimum size requirement.

- the load was first consigned for transport to the place from which it is to be exported.

## 5.3.4

### PLACARDING PORTABLE TANKS AND BULK CONTAINERS

#### 5.3.4.1

Except as exempted by 5.3.8, a portable tank or bulk container that contains dangerous goods, or has contained dangerous goods and has not been cleaned free from dangerous goods, must be placarded with emergency information panels that are:

- (a) selected in accordance with 5.3.4.2;
- (b) displayed in accordance with 5.3.1.4; and
- (c) located on two sides of the tank or container so that, when it is placed on a vehicle, the emergency information panels will, as far as practicable, be visible from both sides of the vehicle.

#### 5.3.4.2

##### EIP Selection

##### 5.3.4.2.1

A portable tank or bulk container that contains only one type of dangerous goods must be placarded with emergency information panels describing those dangerous goods in accordance with 5.3.1.3.1.

##### 5.3.4.2.2

A multi-compartment tank or bulk container that contains different types of dangerous goods in different compartments must:

- (a) have, at each outlet point of each compartment of the tank or container, a mark identifying the dangerous goods contained in that compartment; and
- (b) be placarded with the following:
  - (i) if the dangerous goods in the compartments constitute a mixed load of refined petroleum products - mixed load (refined petroleum product) emergency information panels in accordance with 5.3.1.3.3; or
  - (ii) if the dangerous goods in the compartments have different UN Numbers and are not a mixed load of refined petroleum products - multi-load emergency information panels in accordance with 5.3.1.3.2; or emergency information panels for each compartment containing dangerous goods, together with a rear facing multi-load information panel.

## 5.3.5

### PLACARDING FREIGHT CONTAINERS

**NOTE 1:** This Section 5.3.5 applies to the placarding of freight containers loaded with dangerous goods in packages, large packages, overpacks, IBCs and other placardable units. Section 5.3.4 applies to freight containers that are used as bulk containers in accordance with Chapter 4.3.

**NOTE 2:** If the loaded container is intended for transport by sea or air, then:

- (a) the placarding threshold of this Code does not apply and placarding may be required for all loads that include dangerous goods (reference should be made to the IMDG Code, ICAO Rules or IATA Regulations as applicable); and
- (b) see 5.3.2.1.1 to determine if the UN Number must also be displayed.

- 5.3.5.1 A freight container that contains a placard load of dangerous goods, as determined from Table 5.3, must be placarded in accordance with 5.3.1.4, on both long sides, with placards indicating what dangerous goods are contained, selected in accordance with 5.3.5.2.
- 5.3.5.2 Placard selection**
- 5.3.5.2.1 Where all of the dangerous goods are of a single class or division, except where 5.3.8.2 applies, the placards required by 5.3.5.1 must include:
- (a) the class or division label; and
  - (b) any subsidiary hazard label that is applicable to the goods.
- 5.3.5.2.2 Where there is more than one class or division in the freight container, except where 5.3.8.2 applies, the placards required by 5.3.5.1 must include either or both of the following:
- (a) a mixed class label (model No. 10 in 5.2.2.2.3);
  - (b) all class and division labels for each primary and subsidiary hazard of the dangerous goods in the container, in accordance with 5.3.1.1.2 and 5.3.1.1.3.
- 5.3.5.2.3 Where any dangerous goods are transported in one or more placardable units, the placards required on the freight container by 5.3.5.1 must, except where 5.3.8 applies, include emergency information panels selected in accordance with 5.3.5.3.
- 5.3.5.2.4 The requirement of 5.3.5.2.1 or 5.3.5.2.2 for a label is met if it is included in an emergency information panel required by 5.3.5.2.3.
- 5.3.5.3 EIP Selection**
- 5.3.5.3.1 A freight container in which only one type of dangerous goods is transported in placardable units must be placarded with emergency information panels describing those dangerous goods in accordance with 5.3.1.3.1.
- 5.3.5.3.2 A freight container in which different types of dangerous goods are transported in placardable units must be placarded with either:
- (a) multi-load emergency information panels in accordance with 5.3.1.3.2; or
  - (b) emergency information panels for each of the dangerous goods in accordance with 5.3.1.3.1.
- 5.3.5.4 Placard location**
- When a freight container must be placarded with class, division or mixed class labels, or with emergency information panels, each placard must be placed on the sides of the container so that when the container is placed on the vehicle, each different placard is visible from either side of the vehicle and in accordance with 5.3.1.4.

## **5.3.6 PLACARDING ROAD VEHICLES**

**NOTE:** Some illustrations of the placement of placards for typical vehicle configurations are set out in Figure 5.3.6 at the end of this Chapter.

### **5.3.6.1 All placard loads**

- 5.3.6.1.1 All road vehicles transporting a placard load of dangerous goods, as determined from Table 5.3, must be placarded in accordance with 5.3.1.4 on the front and rear with placards indicating what dangerous goods are being carried.
- 5.3.6.1.2 Where all of the dangerous goods are of a single class or division, the placards required by 5.3.6.1.1 are:
- (a) the class or division label; and
  - (b) any subsidiary hazard labels applicable to the goods
- 5.3.6.1.3 Where there is more than one class of dangerous goods on the vehicle during the journey, the placards required by 5.3.6.1.1 are either or both of the following:
- (a) mixed class labels (model No. 10 in 5.2.2.2.3);
  - (b) all class and division labels for each primary and subsidiary hazard of the dangerous goods on the vehicle, in accordance with 5.3.1.1.2 and 5.3.1.1.3.
- 5.3.6.1.4 If the vehicle is a combination road vehicle, additional placards must be fitted when required by 5.3.6.2.
- 5.3.6.1.5 Where some or all of the dangerous goods are carried in placardable units, bulk containers, portable tanks or tanks which are integral with the vehicle, additional placards must be fitted when required by 5.3.6.3.

### **5.3.6.2 Combination Road Vehicles**

- 5.3.6.2.1 Sub-section 5.3.6.2 applies to a combination road vehicle where the aggregate quantity of dangerous goods carried on all units of the combination comprises a placard load.
- 5.3.6.2.2 The placards that must be fitted in accordance with 5.3.6.1 and 5.3.6.3 to the front and rear of a combination vehicle must be determined based on the aggregate load carried on all units of the combination vehicle.
- 5.3.6.2.3 In addition, placards must be fitted to both sides of each trailer or rigid vehicle that forms part of the combination and is individually carrying a placard load, indicating the dangerous goods that are carried on the individual unit.
- 5.3.6.2.4 Placards fitted to the sides of a unit in accordance with 5.3.6.2.3 must include:
- (a) class, division and/or mixed class labels determined in accordance with 5.3.6.1.2 and 5.3.6.1.3; and
  - (b) emergency information panels determined in accordance with 5.3.6.3 if any of the dangerous goods on the unit are carried in bulk containers, tanks or placardable units.

### 5.3.6.3

### Dangerous goods in bulk containers, tanks or placardable units

#### 5.3.6.3.1

In addition to placards required by 5.3.6.1, a road vehicle on which any dangerous goods are carried in bulk containers, tanks or placardable units must be placarded with emergency information panels in accordance with this sub-section 5.3.6.3.

#### 5.3.6.3.2

#### Placement of Emergency Information Panels

##### 5.3.6.3.2.1

Except as provided in 5.3.6.4, emergency information panels, selected in accordance with 5.3.6.3.3, must be fitted:

- (a) on the rear of a vehicle or vehicle combination on any part of which dangerous goods are carried in one or more bulk containers, tanks or placardable units; and
- (b) on the sides of each trailer or rigid vehicle on which dangerous goods are carried in bulk containers, tanks or placardable units.

##### 5.3.6.3.2.2

Emergency information panels required by 5.3.6.3 must be placed on the vehicle:

- (a) in a substantially vertical plane; and
- (b) with the lower edge at least 450 millimetres<sup>1</sup> above the ground; and
- (c) when fitted to the sides of the vehicle, as close as practicable to the front of the loading area of the vehicle<sup>2</sup>; and
- (d) in accordance with 5.3.1.4.

#### 5.3.6.3.3

#### EIP Selection

##### 5.3.6.3.3.1

A road vehicle transporting only one type of dangerous goods in bulk containers, tanks or placardable units must be placarded with emergency information panels describing those dangerous goods in accordance with 5.3.1.3.1.

##### 5.3.6.3.3.2

A road vehicle transporting different types of dangerous goods in placardable units, bulk containers or tanks (including multi-compartment tanks, containers or units) must:

- (a) be placarded with:
  - (i) if the dangerous goods constitute a mixed load of refined petroleum products:
    - mixed load (refined petroleum product) emergency information panels in accordance with 5.3.1.3.3; or
  - (ii) if the goods are not a mixed load of refined petroleum products:
    - multi-load emergency information panels in accordance with 5.3.1.3.2; or
  - (iii) in lieu of either (i) or (ii):

---

<sup>1</sup> This minimum of 450 mm above ground is intended to accommodate the sides of step-deck trailers transporting portable tanks and other vehicles where location of the emergency information panel in the normal line of vision is not practicable. On road tankers and, where practicable, on other vehicles, it is recommended that panels be at least 1 m above the ground.

<sup>2</sup> Except where this is inconsistent with the placement of a placardable unit on the vehicle, as illustrated in Figure 5.3.6(e).

- individual emergency information panels describing each of the dangerous goods in accordance with 5.3.1.3.3, displayed in such a way that it is clear which goods are in what units; and
- (b) have at each outlet point of each tank or compartment of a multi-compartmented tank, a mark identifying the dangerous goods contained in that tank or compartment.

#### **5.3.6.4**

#### **Exceptions to placarding road vehicles**

##### **5.3.6.4.1**

Where a class, division or mixed class label is required to be displayed on the rear of a vehicle or side of a trailer or rigid vehicle by 5.3.6.1 or 5.3.6.2, it is sufficient compliance with those clauses if the label is incorporated in:

- (a) an emergency information panel displayed on the vehicle in accordance with 5.3.6.3; or
- (b) a placard in accordance with 5.3.3 on a placardable unit carried on the vehicle; or
- (c) a placard in accordance with 5.3.4 on a portable tank or bulk container carried on the vehicle; or
- (d) a placard in accordance with 5.3.5 on a freight container carried on the vehicle; or

that in each case faces, and is clearly visible from, the rear or side, as applicable, of the vehicle where it is required to be displayed.

##### **5.3.6.4.2**

Where a road vehicle is transporting dangerous goods in a portable tank, bulk container, freight container or placardable unit, it is sufficient compliance with 5.3.6.3 if the emergency information panel required by that sub-section is placarded on the tank, container or unit such that it faces, and is clearly visible from, the side of the unit or rear of the vehicle where it is required to be displayed.

##### **5.3.6.4.3**

Despite 5.3.6.3, emergency information panels are not required on a road vehicle transporting dangerous goods that are all in freight containers, portable tanks or bulk containers to which Section 5.3.8 applies.

##### **5.3.6.4.4**

A multi-load or mixed load (refined petroleum product) emergency information panel is not required on a side or rear of a road vehicle transporting different types of dangerous goods in portable tanks, bulk containers or placardable units, if:

- (a) all portable tanks, bulk containers and placardable units are placarded in accordance with Section 5.3.5; and
- (b) at least one emergency information panel for each of the dangerous goods is facing, and is clearly visible from, that side or rear of the vehicle on which:
  - (i) the dangerous goods are being transported; and
  - (ii) the multi-load or mixed load (refined petroleum product) emergency information panel would otherwise be required.

##### **5.3.6.4.5**

Emergency information panels on a spray vehicle may be removed or covered during spraying operations.

## **5.3.7**

## **PLACARDING RAIL WAGONS**

### **5.3.7.1**

### **Rail tank wagons**

#### **5.3.7.1.1**

A rail tank wagon transporting only one type of dangerous goods must be placarded on both sides with an emergency information panel describing those goods in accordance with 5.3.1.3.1.

#### **5.3.7.1.2**

A rail tank wagon transporting different types of dangerous goods in different compartments must:

- (a) be placarded on both sides with either:
  - (i) if the goods are a mixed load of refined petroleum products:
    - mixed load (refined petroleum product) emergency information panels in accordance with 5.3.1.3.3; or
  - (ii) if the goods are not a mixed load of refined petroleum products:
    - multi-load emergency information panels in accordance with 5.3.1.3.2; and
- (b) have at each outlet point of each tank or compartment of a multi-compartmented tank, a mark identifying the dangerous goods contained in that tank or compartment.

### **5.3.7.2**

### **Other rail wagons**

#### **5.3.7.2.1**

Where the only dangerous goods transported on a rail wagon are in freight containers, portable tanks, bulk containers or placardable units, no additional wagon placarding is required provided:

- (a) each placardable unit that contains dangerous goods is either:
  - (i) placarded in accordance with 5.3.3; or
  - (ii) transported in a freight container that is placarded in accordance with sub-clause (b); and
- (b) each freight container in which there is a placard load of dangerous goods is placarded in accordance with 5.3.5 or 5.3.8; and
- (c) each portable tank or bulk container that contains dangerous goods is placarded in accordance with 5.3.4 or 5.3.8; and
- (d) the placards on the tanks, containers and units face both sides of the wagon and are not obscured except as permitted by sub-clause (a)(ii).

#### **5.3.7.2.2**

A rail wagon transporting a placard load of dangerous goods, which are not all in cargo transport units or placardable units that are placarded in accordance 5.3.7.2.1, must be placarded on both sides with:

- (a) if there is only one class or division of dangerous goods on the wagon:
  - (i) the class or division label for the goods; and
  - (ii) any subsidiary hazard labels applicable to the goods; or
- (b) if there is more than one class or division of dangerous goods on the wagon:
  - (i) a mixed class label (model No. 10 in 5.2.2.2.3).

#### **5.3.7.2.3**

A closed rail wagon transporting dangerous goods in one or more placardable units must be placarded with:

- (a) emergency information panels describing those goods in accordance with 5.3.1.3.1 if there is only one type of dangerous goods; or
- (b) multi-load emergency information panels in accordance with 5.3.1.3.2 if there is more than one type of dangerous goods in placardable units.

5.3.7.2.4

Where a placard that is expected on a container, tank or unit in accordance with 5.3.7.2.1 is missing or obscured, the required placard must be replaced or duplicated on the container, tank, unit or wagon in such a way that it is clearly visible, and evident to which container, tank or unit it applies.

## 5.3.8

### PLACARDING INTERMODAL LOADS

5.3.8.1

A freight container, portable tank or bulk container in which dangerous goods are being transported does not need to be placarded with emergency information panels, despite a requirement in this chapter, if:

- (a) the tank or container has been:
  - (i) placarded outside Australia and imported into Australia; or
  - (ii) filled or packed for export from Australia, or for transport between Australian locations by sea or air; or
  - (iii) placarded outside Australia and imported into Australia, emptied, and is being returned overseas while containing residues; and
- (b) the tank or container is marked and placarded fully in accordance with the applicable modal code (IMDG Code, IATA Regulations or ICAO Rules); and
- (c) no goods (dangerous or not) have been removed from or added to the tank or container:
  - (i) if imported: since its arrival in Australia; or
  - (ii) if to be exported: since the load was first consigned for transport to the place from which it is to be exported; or
  - (iii) if loaded for transport between Australian locations by sea or air: the duration of the complete journey including road or rail transport to and from the nominated ports or airports.

5.3.8.2

Despite anything to the contrary in this Chapter, a freight container in which the only dangerous goods being transported are in limited quantities may be placarded with the marking shown in 3.4.6 or 3.4.8, if the conditions specified in paragraphs (a), (b) and (c) of 5.3.8.1 apply.

## 5.3.9

### PLACARD REMOVAL

5.3.9.1

Placards must not be removed from a placardable unit, portable tank, bulk container, road tank vehicle or rail tank wagon that has contained dangerous goods unless all receptacles, tanks and compartments are free from dangerous goods.

5.3.9.2

Placards must be removed from a placardable unit or cargo transport unit that has transported dangerous goods when it has been freed from dangerous goods.

### 5.3.9.3

Placards indicating a particular hazard must be removed from a placardable unit or cargo transport unit that is free from dangerous goods with that hazard.

**NOTE:** See 7.1.7.1.2 regarding restrictions on placard removal from contaminated cargo transport units.

### Figure 5.3.6: Illustrations of Placarding Typical Road Vehicle Configurations

**NOTE:** These illustrations are included for guidance only. They do not apply to all combinations of loads. To ascertain the placarding requirements for any particular load, refer to the text.

## **CHAPTER 5.4: RESERVED**

**NOTE 1:** Chapter 5.4 of the UN23 provides details of documentation required for international, intermodal transport.

**NOTE 2:** Detailed requirements for documentation are provided in Part 11 of this Code.

**NOTE 3:** Some sample documentation is displayed in Appendix B.

## CHAPTER 5.5: SPECIAL PROVISIONS

### 5.5.1 DELETED

### 5.5.2 SPECIAL PROVISIONS APPLICABLE TO FUMIGATED CARGO TRANSPORT UNITS (UN 3359)

#### 5.5.2.1 General

5.5.2.1.1 Fumigated cargo transport units (UN 3359) containing no other dangerous goods are not subject to any provisions of this Code other than those of this section.

5.5.2.1.2 When the fumigated cargo transport unit is loaded with dangerous goods in addition to the fumigant, any provision of this Code relevant to these goods (including placarding, marking and documentation) applies in addition to the provisions of this section.

5.5.2.1.3 Only cargo transport units that can be closed in such a way that the escape of gas is reduced to a minimum must be used for the transport of cargo under fumigation.

#### 5.5.2.2 Training

Persons engaged in the handling of fumigated cargo transport units must be trained commensurate with their responsibilities.

#### 5.5.2.3 Marking and placarding

5.5.2.3.1 A fumigated cargo transport unit must be marked with a warning mark, as specified in 5.5.2.3.2, affixed at each access point in a location where it will be easily seen by persons opening or entering the cargo transport unit. This mark must remain on the cargo transport unit until the following provisions are met:

- (a) The fumigated cargo transport unit has been ventilated to remove harmful concentrations of fumigant gas; and
- (b) The fumigated goods or materials have been unloaded.

5.5.2.3.2 The fumigation warning mark must be as shown in figure 5.5.1.

#### Figure 5.5.1: Fumigation warning mark

The mark must be a rectangle. The minimum dimensions must be 400 mm wide x 300 mm high and the minimum width of the outer line must be 2 mm. The mark must be in black print on a white background with lettering not less than 25 mm high. Where dimensions are not specified, all features must be in approximate proportion to those shown.

5.5.2.3.3

If the fumigated cargo transport unit has been completely ventilated either by opening the doors of the unit or by mechanical ventilation after fumigation, the date of ventilation must be marked on the fumigation warning mark.

5.5.2.3.4

When the fumigated cargo transport unit has been ventilated and unloaded, the fumigation warning mark must be removed.

5.5.2.3.5

Class 9 placards (Model No. 9, see 5.2.2.2.2) must not be affixed to a fumigated cargo transport unit except as required for other Class 9 substances or articles packed therein.

## 5.5.2.4

### Documentation

5.5.2.4.1

Documents associated with the transport of cargo transport units that have been fumigated and have not been completely ventilated before transport must include the following information:

- (a) UN 3359, fumigated cargo transport unit, 9, or UN 3359, fumigated cargo transport unit, class 9;
- (b) The date and time of fumigation; and
- (c) The type and amount of the fumigant used.

5.5.2.4.2

The transport document may be in any form, provided it contains the information required in 5.5.2.4.1. This information must be easy to identify, legible and durable.

- 5.5.2.4.3 Instructions for disposal of any residual fumigant including fumigation devices (if used) must be provided.
- 5.5.2.4.4 A document is not required when the fumigated cargo transport unit has been completely ventilated and the date of ventilation has been marked on the warning mark (see 5.5.2.3.3 and 5.5.2.3.4).

**5.5.3 SPECIAL PROVISIONS APPLICABLE TO PACKAGES AND CARGO TRANSPORT UNITS CONTAINING SUBSTANCES PRESENTING A RISK OF ASPHYXIATION WHEN USED FOR COOLING OR CONDITIONING PURPOSES (SUCH AS DRY ICE (UN 1845) OR NITROGEN, REFRIGERATED LIQUID (UN 1977) OR ARGON, REFRIGERATED LIQUID (UN 1951) OR NITROGEN)**

***NOTE:** In the context of this section the term “conditioning” may be used in a broader scope and includes protection.*

**5.5.3.1 Scope**

- 5.5.3.1.1 This section is not applicable to substances which may be used for cooling or conditioning purposes when transported as a consignment of dangerous goods. When they are transported as a consignment, these substances must be transported under the relevant entry of the Dangerous Goods List in chapter 3.2 in accordance with the associated conditions of transport.
- 5.5.3.1.2 This section is not applicable to gases in cooling cycles.
- 5.5.3.1.3 Dangerous goods used for cooling or conditioning portable tanks or MEGCs during transport are not subject to this section.
- 5.5.3.1.4 Cargo transport units containing substances used for cooling or conditioning purposes include cargo transport units containing substances used for cooling or conditioning purposes inside packages as well as cargo transport units with unpackaged substances used for cooling or conditioning purposes.

**5.5.3.2 General**

- 5.5.3.2.1 Cargo transport units containing substances used for cooling or conditioning purposes (other than fumigation) during transport are not subject to any provisions of this Code other than those of this section.
- 5.5.3.2.2 When dangerous goods are loaded in cargo transport units containing substances used for cooling or conditioning purposes any provisions of this Code relevant to these dangerous goods apply in addition to the provisions of this section.
- 5.5.3.2.3 For air transport, arrangements between consignor and operator must be made for each consignment, to ensure that ventilation safety procedures are followed.

- 5.5.3.2.4 Persons engaged in the handling or transport of cargo transport units containing substances used for cooling or conditioning purposes must be trained commensurate with their responsibilities.
- 5.5.3.3 Packages containing a coolant or conditioner**
- 5.5.3.3.1 Packaged dangerous goods requiring cooling or conditioning assigned to packing instructions P203, P620, P650 or P800, of 4.1.4.1 must meet the appropriate requirements of that packing instruction.
- 5.5.3.3.2 For packaged dangerous goods requiring cooling or conditioning assigned to other packing instructions, the packages must be capable of withstanding very low temperatures and must not be affected or significantly weakened by the coolant or conditioner. Packages must be designed and constructed to permit the release of gas to prevent a build-up of pressure that could rupture the packaging. The dangerous goods must be packed in such a way to prevent movement after the dissipation of any coolant or conditioner.
- 5.5.3.3.3 Packages containing a coolant or conditioner must be transported in well ventilated cargo transport units.
- 5.5.3.4 Marking of packages containing a coolant or conditioner**
- 5.5.3.4.1 Packages containing dangerous goods used for cooling or conditioning must be marked with the proper shipping name of these dangerous goods followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate.
- 5.5.3.4.2 The marks must be durable, legible and placed in such a location and of such a size relative to the package as to be readily visible.
- 5.5.3.5 Cargo transport units containing unpackaged dry ice**
- 5.5.3.5.1 If dry ice in unpackaged form is used, it must not come into direct contact with the metal structure of a cargo transport unit to avoid embrittlement of the metal. Measures must be taken to provide adequate insulation between the dry ice and the cargo transport unit by providing a minimum of 30 mm separation (e.g. by using suitable low heat conducting materials such as timber planks, pallets etc.).
- 5.5.3.5.2 Where dry ice is placed around packages, measures must be taken to ensure that packages remain in the original position during transport after the dry ice has dissipated.
- 5.5.3.6 Marking of cargo transport units**
- 5.5.3.6.1 Cargo transport units containing dangerous goods used for cooling or conditioning purposes must be marked with a warning mark, as specified in 5.5.3.6.2 affixed at each access point in a location where it will be easily seen by persons opening or entering the cargo transport unit. This mark must remain on the cargo transport unit until the following provisions are met:

- (a) The cargo transport unit has been ventilated to remove harmful concentrations of coolant or conditioner; and
- (b) The cooled or conditioned goods have been unloaded.

5.5.3.6.2

The warning mark must be as shown in figure 5.5.2.

**Figure 5.5.2: Asphyxiation warning mark for cargo transport units**

\* Insert proper shipping name of the coolant/conditioner. The lettering must be in capitals, all be on one line and must be at least 25 mm high. If the length of the proper shipping name is too long to fit in the space provided, the lettering may be reduced to the maximum size possible to fit. For example: CARBON DIOXIDE, SOLID. Additional information such as "AS COOLANT" or "AS CONDITIONER" may be added.

The mark must be a rectangle. The minimum dimensions must be 150 mm wide x 250 mm high. The word "WARNING" must be in red or white and be at least 25 mm high.

Where dimensions are not specified, all features must be in approximate proportion to those shown.

### **5.5.3.7**

#### **Documentation**

##### **5.5.3.7.1**

Documents (such as a bill of lading or cargo manifest) associated with the transport of cargo transport units containing or have contained substances used for cooling or conditioning purposes and have not been completely ventilated before transport must include the following information:

- (a) The UN number preceded by the letters "UN"; and
- (b) The proper shipping name followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate.

For example: UN 1845, CARBON DIOXIDE, SOLID, AS COOLANT.

##### **5.5.3.7.2**

The transport document may be in any form, provided it contains the information required in 5.5.3.7.1. This information must be easy to identify, legible and durable.

### **5.5.4**

#### **DANGEROUS GOODS IN EQUIPMENT IN USE OR INTENDED FOR USE DURING TRANSPORT**

##### **5.5.4.1**

Dangerous goods (e.g. lithium batteries, fuel cell cartridges) contained in equipment such as data loggers and cargo tracking devices, attached to or placed in packages, overpacks, containers or load compartments are not subject to any provisions of this Code other than the following:

- (a) the equipment must be in use or intended for use during transport;
- (b) the contained dangerous goods (e.g. lithium batteries, fuel cell cartridges) must meet the applicable construction and test requirements specified in this Code; and
- (c) the equipment must be capable of withstanding the shocks and loadings normally encountered during transport.

##### **5.5.4.2**

When such equipment containing dangerous goods is transported as a consignment, the relevant entry of the Dangerous Goods List in Chapter 3.2 must be used and all applicable provisions of this Code shall apply.

**PART 6**

**REQUIREMENTS FOR THE  
CONSTRUCTION AND TESTING OF  
PACKAGINGS, IBCS, LARGE  
PACKAGINGS, PORTABLE TANKS,  
MEGCS, BULK CONTAINERS, TANK  
VEHICLES, FREIGHT CONTAINERS &  
SEGREGATION DEVICES**

## CHAPTER 6.1: REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PACKAGINGS

### 6.1.1 GENERAL

#### 6.1.1.1 The requirements of this Chapter do not apply to:

- (a) packages containing radioactive material, which must comply with the Regulations of the International Atomic Energy Agency (IAEA), except that:
  - (i) radioactive material possessing other dangerous properties (subsidiary hazards) must also comply with special provision 172; and
  - (ii) low specific activity (LSA) material and surface contaminated objects (SCO) may be carried in certain packagings defined in the Model Regulations provided that the supplementary provisions set out in the IAEA Regulations are also met;
- (b) pressure receptacles;
- (c) packages whose net mass exceeds 400 kg;
- (d) packagings for liquids, other than combination packagings, with a capacity exceeding 450 litres;
- (e) packagings for Division 6.2 infectious substances of Category A except for UN 3549.

6.1.1.2 The requirements for packagings in 6.1.4 are based on packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in 6.1.4, provided that they are equally effective, acceptable to the competent authority and able to successfully fulfil the requirements described in 6.1.1.3 and 6.1.5. Methods of testing other than those described in this Code are acceptable, provided they are equivalent.

6.1.1.3 Every packaging intended to contain liquids must successfully undergo a suitable leakproofness test. This test is part of a quality assurance programme as stipulated in 6.1.1.4 which shows the capability of meeting the appropriate test level indicated in 6.1.5.4.3:

- (a) before it is first used for transport;
- (b) after remanufacturing or reconditioning, before it is re-used for transport.

For this test, packagings need not have their own closures fitted.

The inner receptacle of composite packagings may be tested without the outer packaging provided the test results are not affected. This test is not necessary for inner packagings of combination packagings.

6.1.1.4 Packagings must be manufactured, reconditioned and tested under a quality assurance programme in order to ensure that each packaging meets the requirements of this Chapter.

**NOTE:** AS ISO 16106:2020 “Transport packages for dangerous goods - Dangerous goods packagings, intermediate bulk containers (IBCs)

*and large packagings -Guidelines for the application of ISO 9001” provides acceptable guidance on procedures which may be followed.*

6.1.1.5 Manufacturers and subsequent distributors of packagings must provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for transport are capable of passing the applicable performance tests of this Chapter.

## **6.1.2 CODE FOR DESIGNATING TYPES OF PACKAGINGS**

### **6.1.2.1 The code consists of:**

- (a) an Arabic numeral indicating the kind of packaging, e.g. drum, jerrican, etc., followed by:
- (b) a capital letter(s) in Latin characters indicating the nature of the material, e.g. steel, wood, etc., followed where necessary by:
- (c) an Arabic numeral indicating the category of packaging within the kind to which the packaging belongs.

6.1.2.2 In the case of composite packagings, two capital letters in Latin characters are used in sequence in the second position of the code. The first indicates the material of the inner receptacle and the second that of the outer packaging.

6.1.2.3 In the case of combination packagings, only the code number for the outer packaging is used.

6.1.2.4 The letters “T” or “V” or “W” may follow the packaging code. The letter “T” signifies a salvage packaging conforming to the requirements of 6.1.5.1.11. The letter “V” signifies a special packaging conforming to the requirements of 6.1.5.1.12. The letter “W” signifies that the packaging, although of the same type indicated by the code, is manufactured to a specification different from that in 6.1.4 and is considered equivalent under the requirements of 6.1.1.2.

6.1.2.5 The following numerals must be used for the kinds of packaging:

1. Drum
2. Reserved
3. Jerrican
4. Box
5. Bag
6. Composite packaging

6.1.2.6 The following capital letters must be used for the types of material:

- A. Steel (all types and surface treatments)
- B. Aluminium
- C. Natural wood
- D. Plywood
- F. Reconstituted wood

- G. Fibreboard
- H. Plastics material
- L. Textile
- M. Paper, multiwall
- N. Metal (other than steel or aluminium)
- P. Glass, porcelain or stoneware

**NOTE:** *Plastics materials, is taken to include other polymeric materials such as rubber.*

6.1.2.7                   The following table indicates the codes to be used for designating types of packagings depending on the kind of packagings, the material used for their construction and their category; it also refers to the paragraphs to be consulted for the appropriate requirements:

**Table 6.1.2.7: Codes To Be Used For Designating Types of Packagings**

| Kind         | Material                                | Category           | Code | Paragraph |
|--------------|-----------------------------------------|--------------------|------|-----------|
| 1. Drums     | A. Steel                                | non-removable head | 1A1  | 6.1.4.1   |
|              |                                         | removable head     | 1A2  |           |
|              | B. Aluminium                            | non-removable head | 1B1  | 6.1.4.2   |
|              |                                         | removable head     | 1B2  |           |
|              | D. Plywood                              |                    | 1D   | 6.1.4.5   |
|              | G. Fibre                                |                    | 1G   | 6.1.4.7   |
|              | H. Plastics                             | non-removable head | 1H1  | 6.1.4.8   |
|              |                                         | removable head     | 1H2  |           |
|              | N. Metal, other than steel or aluminium | non-removable head | 1N1  | 6.1.4.3   |
|              |                                         | removable head     | 1N2  |           |
| 2. Reserved  |                                         |                    |      |           |
| 3. Jerricans | A. Steel                                | non-removable head | 3A1  | 6.1.4.4   |
|              |                                         | removable head     | 3A2  |           |
|              | B. Aluminium                            | non-removable head | 3B1  | 6.1.4.4   |
|              |                                         | removable head     | 3B2  |           |
|              | H. Plastics                             | non-removable head | 3H1  | 6.1.4.8   |
|              |                                         | removable head     | 3H2  |           |

| Kind     | Material                                | Category                       | Code | Paragraph |
|----------|-----------------------------------------|--------------------------------|------|-----------|
| 4. Boxes | A. Steel                                |                                | 4A   | 6.1.4.14  |
|          | B. Aluminium                            |                                | 4B   | 6.1.4.14  |
|          | C. Natural wood                         | ordinary                       | 4C1  | 6.1.4.9   |
|          |                                         | with sift-proof walls          | 4C2  |           |
|          | D. Plywood                              |                                | 4D   | 6.1.4.10  |
|          | F. Reconstituted wood                   |                                | 4F   | 6.1.4.11  |
|          | G. Fibreboard                           |                                | 4G   | 6.1.4.12  |
|          | H. Plastics                             | expanded                       | 4H1  | 6.1.4.13  |
|          |                                         | solid                          | 4H2  |           |
|          | N. Metal, other than steel or aluminium |                                | 4N   | 6.1.4.14  |
| 5. Bags  | H. Woven plastics                       | without inner liner or coating | 5H1  | 6.1.4.16  |
|          |                                         | sift-proof                     | 5H2  |           |
|          |                                         | water-resistant                | 5H3  |           |
|          | H. Plastics film                        |                                | 5H4  | 6.1.4.17  |
|          | L. Textile                              | without inner liner or coating | 5L1  | 6.1.4.15  |
|          |                                         | sift proof                     | 5L2  |           |
|          |                                         | water-resistant                | 5L3  |           |
|          | M. Paper                                | multiwall                      | 5M1  | 6.1.4.18  |
|          |                                         | multiwall, water-resistant     | 5M2  |           |

| Kind                    | Material                                    | Category                       | Code | Paragraph |
|-------------------------|---------------------------------------------|--------------------------------|------|-----------|
| 6. Composite packagings | H. Plastics receptacle                      | in steel drum                  | 6HA1 | 6.1.4.19  |
|                         |                                             | in steel crate or box          | 6HA2 | 6.1.4.19  |
|                         |                                             | in aluminium drum              | 6HB1 | 6.1.4.19  |
|                         |                                             | in aluminium crate or box      | 6HB2 | 6.1.4.19  |
|                         |                                             | in wooden box                  | 6HC  | 6.1.4.19  |
|                         |                                             | in plywood drum                | 6HD1 | 6.1.4.19  |
|                         |                                             | in plywood box                 | 6HD2 | 6.1.4.19  |
|                         |                                             | in fibre drum                  | 6HG1 | 6.1.4.19  |
|                         |                                             | in fibreboard box              | 6HG2 | 6.1.4.19  |
|                         |                                             | in plastics drum               | 6HH1 | 6.1.4.19  |
|                         |                                             | in solid plastics box          | 6HH2 | 6.1.4.19  |
|                         | P. Glass, porcelain or stoneware receptacle | in steel drum                  | 6PA1 | 6.1.4.20  |
|                         |                                             | in steel crate or box          | 6PA2 | 6.1.4.20  |
|                         |                                             | in aluminium drum              | 6PB1 | 6.1.4.20  |
|                         |                                             | in aluminium crate or box      | 6PB2 | 6.1.4.20  |
|                         |                                             | in wooden box                  | 6PC  | 6.1.4.20  |
|                         |                                             | in plywood drum                | 6PD1 | 6.1.4.20  |
|                         |                                             | in wickerwork hamper           | 6PD2 | 6.1.4.20  |
|                         |                                             | in fibre drum                  | 6PG1 | 6.1.4.20  |
|                         |                                             | in fibreboard box              | 6PG2 | 6.1.4.20  |
|                         |                                             | in expanded plastics packaging | 6PH1 | 6.1.4.20  |
|                         |                                             | in solid plastics packaging    | 6PH2 | 6.1.4.20  |

### 6.1.3

### MARKING

**NOTE 1:** The marks indicate that the packaging which bears them corresponds to a successfully tested design type and that it complies with the requirements of this chapter which are related to the manufacture, but not to the use, of the packaging. In itself, therefore, the marks do not necessarily confirm that the packaging may be used for any substance: generally the type of packaging (e.g. steel drum), its maximum capacity and/or mass, and any special requirements are specified for each substance in part 3 of this Code.

**NOTE 2:** The marks are intended to be of assistance to packaging manufacturers, reconditioners, packaging users, regulatory authorities and everyone involved in the transport of dangerous goods. In relation

to the use of a new packaging, the original marks area means for its manufacturer(s) to identify the type and to indicate those performance test regulations that have been met.

**NOTE 3:** The marks do not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings. For example, a packaging having an X or Y mark may be used for substances to which a packing group having a lesser degree of danger has been assigned with the relevant maximum permissible value of the relative density<sup>1</sup> determined by taking into account the factor 1.5 or 2.25 indicated in the test requirements for packagings in 6.1.5 as appropriate, i.e. packing group I packaging tested for products of relative density 1.2 could be used as a packing group II packaging for products of relative density 1.8 or a packing group III packaging of relative density 2.7, provided of course that all the performance criteria can still be met with the higher relative density product.

#### 6.1.3.1

Each packaging intended for use according to this Code must bear marks on a non-removable component which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the marks or a duplicate thereof must appear on the top or on a side of the packaging. Letters, numerals and symbols must be at least 12 mm high, except for packagings of 30 litres capacity or less or of 30 kg maximum net mass, when they must be at least 6 mm in height and except for packagings of 5 litres capacity or less or of 5 kg maximum net mass when they must be of an appropriate size.

The marks must show:

- (a) the United Nations packaging symbol.

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8. For embossed metal packagings the capital letters “UN” may be applied as the symbol;

- (b) the code designating the type of packaging according to 6.1.2;
- (c) a code in two parts:
- (i) a letter designating the packing group(s) for which the design type has been successfully tested:
    - X for packing groups I, II and III
    - Y for packing groups II and III
    - Z for packing group III only;

---

<sup>1</sup>Relative density (d) is considered to be synonymous with Specific Gravity (SG) and is used throughout this text.

- (ii) the relative density, rounded off to the first decimal, for which the design type has been tested for packagings without inner packagings intended to contain liquids; this may be omitted when the relative density does not exceed 1.2. For packagings intended to contain solids or inner packagings, the maximum gross mass in kilograms;
- (d) either the letter “S” denoting that the packaging is intended for the transport of solids or inner packagings or, for packagings (other than combination packagings) intended to contain liquids, the hydraulic test pressure which the packaging was shown to withstand in kPa rounded down to the nearest 10 kPa;
- (e) the last two digits of the year during which the packaging was manufactured. Packagings of types IH and 3H must also be appropriately marked with the month of manufacture; this may be marked on the packaging in a different place from the remainder of the marks. An appropriate method is.

\* The last two digits of the year of manufacture may be displayed at that place. In such a case and when the clock is placed adjacent to the UN design type mark, the indication of the year in the mark may be waived. However, when the clock is not placed adjacent to the UN design type mark, the two digits of the year in the mark and in the clock shall be identical

**NOTE 1:** Other methods that provide the minimum required information in a durable, visible and legible form are also acceptable.

**NOTE 2:** The provisions of 6.1.3.1 of the twenty-second revised edition of the Recommendations on the Transport of Dangerous Goods, Model Regulations may continue to be applied until 31 December 2026. Packagings manufactured before 1 January 2027 according to the provisions applicable at the date of manufacture may continue to be used.

- (f) the State authorising the allocation of the mark, indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>;
- (g) the name of the manufacturer or other identification of the packaging specified by the competent authority.

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

- 6.1.3.2 In addition to the durable marks prescribed in 6.1.3.1, every new metal drum of a capacity greater than 100 litres must bear the marks described in 6.1.3.1(a) to (e) on the bottom, with an indication of the nominal thickness of at least the metal used in the body (in mm, to 0.1 mm), in permanent form (e.g. embossed). When the nominal thickness of either head of a metal drum is thinner than that of the body, the nominal thicknesses of the top head, body, and bottom head must be marked on the bottom in permanent form (e.g. embossed), for example “1.0-1.2-1.0” or “0.9-1.0-1.0”. Nominal thicknesses of metal must be determined according to the appropriate ISO or Australian standard, for example ISO 3574:1999 or AS/NZS 1595 for steel. The marks indicated in 6.1.3.1(f) and (g) must not be applied in a permanent form (e.g. embossed) except as provided in 6.1.3.5.
- 6.1.3.3 Every packaging other than those referred to in 6.1.3.2 liable to undergo a reconditioning process must bear the marks indicated in 6.1.3.1(a) to (e) in a permanent form. Marks are permanent if they are able to withstand the reconditioning process (e.g. embossed). For packagings other than metal drums of a capacity greater than 100 litres, these permanent marks may replace the corresponding durable marks prescribed in 6.1.3.1.
- 6.1.3.4 For remanufactured metal drums, if there is no change to the packaging type and no replacement or removal of integral structural components, the required marks need not be permanent (e.g. embossed). Every other remanufactured metal drum must bear the marks in 6.1.3.1(a) to (e) in a permanent form (e.g. embossed) on the top head or side.
- 6.1.3.5 Metal drums made from materials (e.g. stainless steel) designed to be reused repeatedly may bear the marks indicated in 6.1.3.1(f) and (g) in a permanent form (e.g. embossed).
- 6.1.3.6 Packagings manufactured with recycled plastics material as defined in 1.2.1 must be marked “REC”. This marks must be placed near the mark prescribed in 6.1.3.1.
- 6.1.3.7 Marks must be applied in the sequence shown in 6.1.3.1; each mark required in these sub-paragraphs and when appropriate, (h) to (j) of 6.1.3.8, must be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For examples, see 6.1.3.10.
- Any additional marks authorised by a competent authority must still enable the other marks required in 6.1.3.1 to be correctly identified.
- 6.1.3.8 After reconditioning a packaging, the reconditioner must apply to it, in sequence, a durable marks showing:
- (h) the State in which the reconditioning was carried out, indicated by the indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>;

---

<sup>1</sup>*Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.*

- (i) the name of the reconditioner or other identification of the packaging specified by the competent authority;
- (j) the year of reconditioning; the letter “R”; and, for every packaging successfully passing the leakproofness test in 6.1.1.3, the additional letter “L”.

#### 6.1.3.9

When, after reconditioning, the marks required by 6.1.3.1(a) to (d) no longer appear on the top head or the side of a metal drum, the reconditioner also must apply them in a durable form followed by 6.1.3.8(h), (i) and (j). These marks must not identify a greater performance capability than that for which the original design type had been tested and marked.

#### 6.1.3.10

#### Examples for marking NEW packagings

|                                                                                     |                              |                                                                           |                                                                |
|-------------------------------------------------------------------------------------|------------------------------|---------------------------------------------------------------------------|----------------------------------------------------------------|

### 6.1.3.12

### Example for marking SALVAGE packagings

|                                                                                   |                            |                                                                        |
|-----------------------------------------------------------------------------------|----------------------------|------------------------------------------------------------------------|
|  | 1A2T/Y300/S/01/<br>USA/abc | as in 6.1.3.1(a), (b), (c), (d)<br>and (e)<br>as in 6.1.3.1(f) and (g) |
|-----------------------------------------------------------------------------------|----------------------------|------------------------------------------------------------------------|

**NOTE:** The marking, for which examples are given in 6.1.3.10, 6.1.3.11 and 6.1.3.12, may be applied in a single line or in multiple lines provided the correct sequence is respected.

### 6.1.3.13

Where a packaging conforms to one or more than one tested packaging design type, including one or more than one tested IBC or large packaging design type, the packaging may bear more than one mark to indicate the relevant performance test requirements that have been met. Where more than one mark appears on a packaging, the marks must appear in close proximity to one another and each mark must appear in its entirety

### 6.1.3.14

### Packagings that have not been performance tested

If a packaging is exempt from performance testing, it must be marked in a manner that enables its origins to be traced.

## 6.1.4

## REQUIREMENTS FOR PACKAGINGS

### 6.1.4.0

### General requirements

Any permeation of the substance contained in the packaging must not constitute a danger under normal conditions of transport.

### 6.1.4.1

### Steel drums

1A1 non-removable head

1A2 removable head

#### 6.1.4.1.1

Body and heads must be constructed of steel sheet of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.

**NOTE:** In the case of carbon steel drums, “suitable” steels are identified in ISO 3573:1999 “Hot rolled carbon steel sheet of commercial and drawing qualities” and ISO 3574:1999 “Cold-reduced carbon steel sheet of commercial and drawing qualities”. For carbon steel drums below 100 litres “suitable” steels in addition to the above standards are also identified in ISO 11949:1995 “Cold-reduced electrolytic tinplate”, ISO 11950:1995 “Cold-reduced electrolytic chromium/chromium oxide-coated steel” and ISO 11951:1995 “Cold-reduced blackplate in coil form for the production of tinplate or electrolytic chromium/chromium-oxide coated steel”.

#### 6.1.4.1.2

Body seams must be welded on drums intended to contain more than 40 litres of liquid. Body seams must be mechanically seamed or welded on drums intended to contain solids or 40 litres or less of liquids.

- 6.1.4.1.3 Chimes must be mechanically seamed or welded. Separate reinforcing rings may be applied.
- 6.1.4.1.4 Drums may have rolling hoops, either expanded or separate. If there are separate rolling hoops they must be fitted tightly on the body and so secured that they cannot shift. Rolling hoops must not be spot welded.
- 6.1.4.1.5 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1A1) drums must not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1A2). Closures for openings in the bodies and heads of drums must be so designed and applied that they will remain secure and leakproof under normal conditions of transport. Closure flanges may be mechanically seamed or welded in place. Gaskets or other sealing elements must be used with closures, unless the closure is inherently leakproof.
- 6.1.4.1.6 Closure devices for removable head drums must be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of transport. Gaskets or other sealing elements must be used with all removable heads.
- 6.1.4.1.7 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be transported, suitable internal protective coatings or treatments must be applied. These coatings or treatments must retain their protective properties under normal conditions of transport.
- 6.1.4.1.8 Maximum capacity of drum: 450 litres
- 6.1.4.1.9 Maximum net mass: 400 kg
- 6.1.4.2 Aluminium drums**
- 1B1 non-removable head
- 1B2 removable head
- 6.1.4.2.1 Body and heads must be constructed of aluminium at least 99% pure or of an aluminium base alloy. Material must be of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.
- 6.1.4.2.2 All seams must be welded. Chime seams, if any, must be reinforced by the application of separate reinforcing rings.
- 6.1.4.2.3 Drums may have rolling hoops, either expanded or separate. If there are separate rolling hoops they must be fitted tightly on the body and so secured that they cannot shift. Rolling hoops must not be spot welded.

- 6.1.4.2.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1B1) drums must not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1B2). Closures for openings in the bodies and heads of drums must be so designed and applied that they will remain secure and leakproof under normal conditions of transport. Closure flanges must be welded in place so that the weld provides a leakproof seam. Gaskets or other sealing elements must be used with closures, unless the closure is inherently leakproof.
- 6.1.4.2.5 Closure devices for removable head drums must be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of transport. Gaskets or other sealing elements must be used with all removable heads.
- 6.1.4.2.6 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be transported, suitable internal protective coatings or treatments must be applied. These coatings or treatments must retain their protective properties under normal conditions of transport.
- 6.1.4.2.7 Maximum capacity of drum: 450 litres
- 6.1.4.2.8 Maximum net mass: 400 kg
- 6.1.4.3 Drums of metal other than steel or aluminium**
- 1N1 non-removable head
- 1N2 removable head
- 6.1.4.3.1 The body and heads must be constructed of a metal or of a metal alloy other than steel or aluminium. Material must be of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.
- 6.1.4.3.2 Chime seams, if any, must be reinforced by the application of separate reinforcing rings. All seams, if any, must be joined (welded, soldered, etc.) in accordance with the technical state of the art for the used metal or metal alloy.
- 6.1.4.3.3 Drums may have rolling hoops, either expanded or separate. If there are separate rolling hoops they must be fitted tightly on the body and so secured that they cannot shift. Rolling hoops must not be spot welded.
- 6.1.4.3.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1N1) drums must not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1N2). Closures for openings in the bodies and heads of drums must be so designed and applied that they will remain secure and leakproof under normal conditions of transport. Closure flanges must be joined in place (welded, soldered, etc.) in accordance with the technical state of the art for the used metal or metal alloy so that the seam join is leakproof. Gaskets or other sealing elements must be used with closures, unless the closure is inherently leakproof.

- 6.1.4.3.5 Closure devices for removable head drums must be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of transport. Gaskets or other sealing elements must be used with all removable heads.
- 6.1.4.3.6 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be transported, suitable internal protective coatings or treatments must be applied. These coatings or treatments must retain their protective properties under normal conditions of transport.
- 6.1.4.3.7 Maximum capacity of drum: 450 litres
- 6.1.4.3.8 Maximum net mass: 400 kg
- 6.1.4.4 Steel or aluminium jerricans**
- 3A1 steel, non-removable head
- 3A2 steel, removable head
- 3B1 aluminium, non-removable head
- 3B2 aluminium, removable head
- 6.1.4.4.1 Body and heads must be constructed of steel sheet, of aluminium at least 99% pure or of an aluminium base alloy. Material must be of a suitable type and of adequate thickness in relation to the capacity of the jerrican and to its intended use.
- 6.1.4.4.2 Chimes of steel jerricans must be mechanically seamed or welded. Body seams of steel jerricans intended to contain more than 40 litres of liquid must be welded. Body seams of steel jerricans intended to contain 40 litres or less must be mechanically seamed or welded. For aluminium jerricans, all seams must be welded. Chime seams, if any, must be reinforced by the application of a separate reinforcing ring.
- 6.1.4.4.3 Openings in jerricans (3A1 and 3B1) must not exceed 7 cm in diameter. Jerricans with larger openings are considered to be of the removable head type (3A2 and 3B2). Closures must be so designed that they will remain secure and leakproof under normal conditions of transport. Gaskets or other sealing elements must be used with closures, unless the closure is inherently leakproof.
- 6.1.4.4.4 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be transported, suitable internal protective coatings or treatments must be applied. These coatings or treatments must retain their protective properties under normal conditions of transport.
- 6.1.4.4.5 Maximum capacity of jerrican: 60 litres
- 6.1.4.4.6 Maximum net mass: 120 kg
- 6.1.4.5 Plywood drums**
- 1D

- 6.1.4.5.1 The wood used must be well-seasoned, commercially dry and free from any defect likely to lessen the effectiveness of the drum for the purpose intended. If a material other than plywood is used for the manufacture of the heads, it must be of a quality equivalent to the plywood.
- 6.1.4.5.2 At least two-ply plywood must be used for the body and at least three-ply plywood for the heads; the plies must be firmly glued together by a water-resistant adhesive with their grain crosswise.
- 6.1.4.5.3 The body and heads of the drum and their joins must be of a design appropriate to the capacity of the drum and to its intended use.
- 6.1.4.5.4 In order to prevent sifting of the contents, lids must be lined with kraft paper or some other equivalent material which must be securely fastened to the lid and extend to the outside along its full circumference.
- 6.1.4.5.5 Maximum capacity of drum: 250 litres
- 6.1.4.5.6 Maximum net mass: 400 kg
- 6.1.4.6 Deleted**
- 6.1.4.7 Fibre drums**
- 1G
- 6.1.4.7.1 The body of the drum must consist of multiple plies of heavy paper or fibreboard (without corrugations) firmly glued or laminated together and may include one or more protective layers of bitumen, waxed kraft paper, metal foil, plastics material, etc.
- 6.1.4.7.2 Heads must be of natural wood, fibreboard, metal, plywood, plastics or other suitable material and may include one or more protective layers of bitumen, waxed kraft paper, metal foil, plastics material, etc.
- 6.1.4.7.3 The body and heads of the drum and their joins must be of a design appropriate to the capacity of the drum and to its intended use.
- 6.1.4.7.4 The assembled packaging must be sufficiently water-resistant so as not to delaminate under normal conditions of transport.
- 6.1.4.7.5 Maximum capacity of drum: 450 litres
- 6.1.4.7.6 Maximum net mass: 400 kg
- 6.1.4.8 Plastics drums and jerricans**
- 1H1 drums, non-removable head
- 1H2 drums, removable head
- 3H1 jerricans, non-removable head
- 3H2 jerricans, removable head

- 6.1.4.8.1 The packaging must be manufactured from suitable plastics material and be of adequate strength in relation to its capacity and intended use. Except for recycled plastics material as defined in 1.2.1, no used material other than production residues or regrind from the same manufacturing process may be used. The packaging must be adequately resistant to ageing and to degradation caused either by the substance contained or by ultra-violet radiation.
- 6.1.4.8.2 If protection against ultra-violet radiation is required, it must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, retesting may be waived if the carbon black content does not exceed 2% by mass or if the pigment content does not exceed 3% by mass; the content of inhibitors of ultra-violet radiation is not limited.
- 6.1.4.8.3 Additives serving purposes other than protection against ultra-violet radiation may be included in the composition of the plastics material provided that they do not adversely affect the chemical and physical properties of the material of the packaging. In such circumstances, retesting may be waived.
- 6.1.4.8.4 The wall thickness at every point of the packaging must be appropriate to its capacity and intended use, taking into account the stresses to which each point is liable to be exposed.
- 6.1.4.8.5 Openings for filling, emptying and venting in the bodies or heads of non-removable head drums (1H1) and jerricans (3H1) must not exceed 7 cm in diameter. Drums and jerricans with larger openings are considered to be of the removable head type (1H2 and 3H2). Closures for openings in the bodies or heads of drums and jerricans must be so designed and applied that they will remain secure and leakproof under normal conditions of transport. Gaskets or other sealing elements must be used with closures unless the closure is inherently leakproof.
- 6.1.4.8.6 Closure devices for removable head drums and jerricans must be so designed and applied that they will remain secure and leakproof under normal conditions of transport. Gaskets must be used with all removable heads unless the drum or jerrican design is such that, where the removable head is properly secured, the drum or jerrican is inherently leakproof.
- 6.1.4.8.7 Maximum capacity of drums and jerricans:  
1H1, 1H2: 450 litres  
3H1, 3H2: 60 litres
- 6.1.4.8.8 Maximum net mass:  
1H1, 1H2: 400 kg  
3H1, 3H2: 120 kg

#### **6.1.4.9 Boxes of natural wood**

4C1 ordinary

4C2 with sift-proof walls

6.1.4.9.1 The wood used must be well-seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the box. The strength of the material used and the method of construction must be appropriate to the capacity and intended use of the box. The tops and bottoms may be made of water-resistant reconstituted wood such as hardboard, particle board or other suitable type.

6.1.4.9.2 Fastenings must be resistant to vibration experienced under normal conditions of transport. End grain nailing must be avoided whenever practicable. Joins which are likely to be highly stressed must be made using clenched or annular ring nails or equivalent fastenings.

6.1.4.9.3 Box 4C2: each part must consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when one of the following methods of glued assembly is used: Lindermann joint, tongue and groove joint, ship lap or rabbet joint or butt joint with at least two corrugated metal fasteners at each joint.

6.1.4.9.4 Maximum net mass: 400 kg

#### **6.1.4.10 Plywood boxes**

4D

6.1.4.10.1 Plywood used must be at least 3-ply. It must be made from well-seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the box. The strength of the material used and the method of construction must be appropriate to the capacity and intended use of the box. All adjacent plies must be glued with water-resistant adhesive. Other suitable materials may be used together with plywood in the construction of boxes. Boxes must be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.

6.1.4.10.2 Maximum net mass: 400 kg

#### **6.1.4.11 Reconstituted wood boxes**

4F

6.1.4.11.1 The walls of boxes must be made of water-resistant reconstituted wood such as hardboard, particle board or other suitable type. The strength of the material used and the method of construction must be appropriate to the capacity of the boxes and to their intended use.

6.1.4.11.2 Other parts of the boxes may be made of other suitable material.

6.1.4.11.3 Boxes must be securely assembled by means of suitable devices.

6.1.4.11.4 Maximum net mass: 400 kg

#### **6.1.4.12 Fibreboard boxes (including corrugated fibreboard boxes)**

4G

- 6.1.4.12.1 Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) must be used, appropriate to the capacity of the box and to its intended use. The water resistance of the outer surface must be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m<sup>2</sup> - see ISO 535:2014. It must have proper bending qualities. Fibreboard must be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard must be firmly glued to the facings.
- 6.1.4.12.2 The ends of boxes may have a wooden frame or be entirely of wood or other suitable material. Reinforcements of wooden battens or other suitable material may be used.
- 6.1.4.12.3 Manufacturing joins in the body of boxes must be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joins must have an appropriate overlap.
- 6.1.4.12.4 Where closing is effected by gluing or taping, a water-resistant adhesive must be used.
- 6.1.4.12.5 Boxes must be designed so as to provide a good fit to the contents.
- 6.1.4.12.6 Maximum net mass: 400 kg

#### **6.1.4.13 Plastics boxes**

4H1 expanded plastics boxes

4H2 solid plastics boxes

- 6.1.4.13.1 The box must be manufactured from suitable plastics material and be of adequate strength in relation to its capacity and intended use. The box must be adequately resistant to ageing and to degradation caused either by the substance contained or by ultra-violet radiation.
- 6.1.4.13.2 An expanded plastics box must comprise two parts made of a moulded expanded plastics material, a bottom section containing cavities for the inner packagings and a top section covering and interlocking with the bottom section. The top and bottom sections must be designed so that the inner packagings fit snugly. The closure cap for any inner packaging must not be in contact with the inside of the top section of this box.
- 6.1.4.13.3 For dispatch, an expanded plastics box must be closed with a self-adhesive tape having sufficient tensile strength to prevent the box from opening. The adhesive tape must be weather resistant and its adhesive compatible with the expanded plastics material of the box. Other closing devices at least equally effective may be used.

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.1.4.13.4      | For solid plastics boxes, protection against ultra-violet radiation, if required, must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the box. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, retesting may be waived if the carbon black content does not exceed 2% by mass or if the pigment content does not exceed 3% by mass; the content of inhibitors of ultra-violet radiation is not limited. |
| 6.1.4.13.5      | Additives serving purposes other than protection against ultra-violet radiation may be included in the composition of the plastics material provided that they do not adversely affect the chemical or physical properties of the material of the box. In such circumstances, retesting may be waived.                                                                                                                                                                                                                                                                                                                        |
| 6.1.4.13.6      | Solid plastics boxes must have closure devices made of a suitable material of adequate strength and so designed as to prevent the box from unintentional opening.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6.1.4.13.7      | Maximum net mass:<br>4H1: 60 kg<br>4H2: 400 kg                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 6.1.4.17.1      | Bags must be made of a suitable plastics material. The strength of the material used and the construction of the bag must be appropriate to the capacity of the bag and to its intended use. Joins and closures must withstand pressures and impacts liable to occur under normal conditions of transport.                                                                                                                                                 |
| 6.1.4.17.2      | Maximum net mass: 50 kg                                                                                                                                                                                                                                                                                                                                                                                                                                    |

#### **6.1.4.18**

#### **Paper bags**

5M1 multiwall

5M2 multiwall, water-resistant

##### **6.1.4.18.1**

Bags must be made of a suitable kraft paper or of an equivalent paper with at least three plies, the middle ply of which may be net-cloth with adhesive bonding to the outer ply. The strength of the paper and the construction of the bags must be appropriate to the capacity of the bag and to its intended use. Joins and closures must be sift-proof.

##### **6.1.4.18.2**

Bags 5M2: to prevent the entry of moisture, a bag of four plies or more must be made waterproof by the use of either a water resistant ply as one of the two outermost plies or a water-resistant barrier made of a suitable protective material between the two outermost plies; a bag of three plies must be made waterproof by the use of a water-resistant ply as the outermost ply.

Where there is a danger of the substance contained reacting with moisture or where it is packed damp, a waterproof ply or barrier, such as double-tarred kraft paper, plastics-coated kraft paper, plastics film bonded to the inner surface of the bag, or one or more inner plastics liners, must also be placed next to the substance. Joins and closures must be waterproof.

##### **6.1.4.18.3**

Maximum net mass: 50 kg

#### **6.1.4.19**

#### **Composite packagings (plastics material)**

6HA1 plastics receptacle with outer steel drum

6HA2 plastics receptacle with outer steel crate or box

6HB1 plastics receptacle with outer aluminium drum

6HB2 plastics receptacle with outer aluminium crate or box

6HC plastics receptacle with outer wooden box

6HD1 plastics receptacle with outer plywood drum

6HD2 plastics receptacle with outer plywood box

6HG1 plastics receptacle with outer fibre drum

6HG2 plastics receptacle with outer fibreboard box

6HH1 plastics receptacle with outer plastics drum

6HH2 plastics receptacle with outer solid plastics box

##### **6.1.4.19.1**

Inner receptacle

##### **6.1.4.19.1.1**

The requirements of 6.1.4.8.1 and 6.1.4.8.3 to 6.1.4.8.6 apply to inner plastics receptacles.

##### **6.1.4.19.1.2**

The inner plastics receptacle must fit snugly inside the outer packaging, which must be free of any projection that might abrade the plastics material.

##### **6.1.4.19.1.3**

Maximum capacity of inner receptacle:

6HA1, 6HB1, 6HD1, 6HG1, 6HH1: 250 litres

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.1.4.20.1.1 | Receptacles must be of a suitable form (cylindrical or pear-shaped) and be made of good quality material free from any defect that could impair their strength. The walls must be sufficiently thick at every point.                                                                                                                                                                                                                                                                       |
| 6.1.4.20.1.2 | Screw-threaded plastics closures, ground glass stoppers or closures at least equally effective must be used as closures for receptacles. Any part of the closure likely to come into contact with the contents of the receptacle must be resistant to those contents. Care must be taken to ensure that the closures are so fitted as to be leakproof and are suitably secured to prevent any loosening during transport. If vented closures are necessary, they must comply with 4.1.1.8. |
| 6.1.4.20.1.3 | The receptacle must be firmly secured in the outer packaging by means of cushioning and/or absorbent materials.                                                                                                                                                                                                                                                                                                                                                                            |
| 6.1.4.20.1.4 | Maximum capacity of receptacle: 60 litres                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 6.1.4.20.1.5 | Maximum net mass: 75 kg                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 6.1.4.20.2   | Outer packaging                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6.1.4.20.2.1 | Receptacle with outer steel drum 6PA1: the relevant requirements of 6.1.4.1 apply to the construction of the outer packaging. The removable lid required for this type of packaging may nevertheless be in the form of a cap.                                                                                                                                                                                                                                                              |
| 6.1.4.20.2.2 | Receptacle with outer steel crate or box 6PA2: the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging. For cylindrical receptacles the outer packaging must, when upright, rise above the receptacle and its closure. If the crate surrounds a pear-shaped receptacle and is of matching shape, the outer packaging must be fitted with a protective cover (cap).                                                                                          |
| 6.1.4.20.2.3 | Receptacle with outer aluminium drum 6PB1: the relevant requirements of 6.1.4.2 apply to the construction of the outer packaging.                                                                                                                                                                                                                                                                                                                                                          |
| 6.1.4.20.2.4 | Receptacle with outer aluminium crate or box 6PB2: the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging.                                                                                                                                                                                                                                                                                                                                                 |
| 6.1.4.20.2.5 | Receptacle with outer wooden box 6PC: the relevant requirements of 6.1.4.9 apply to the construction of the outer packaging.                                                                                                                                                                                                                                                                                                                                                               |
| 6.1.4.20.2.6 | Receptacle with outer plywood drum 6PD1: the relevant requirements of 6.1.4.5 apply to the construction of the outer packaging.                                                                                                                                                                                                                                                                                                                                                            |
| 6.1.4.20.2.7 | Receptacle with outer wickerwork hamper 6PD2: the wickerwork hamper must be properly made with material of good quality. It must be fitted with a protective cover (cap) so as to prevent damage to the receptacle.                                                                                                                                                                                                                                                                        |
| 6.1.4.20.2.8 | Receptacle with outer fibre drum 6PG1: the relevant requirements of 6.1.4.7.1 to 6.1.4.7.4 apply to the construction of the outer packaging.                                                                                                                                                                                                                                                                                                                                               |
| 6.1.4.20.2.9 | Receptacle with outer fibreboard box 6PG2: the relevant requirements of 6.1.4.12 apply to the construction of the outer packaging.                                                                                                                                                                                                                                                                                                                                                         |

|                 |                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.1.4.20.2.10   | Receptacle with outer expanded plastics or solid plastics packaging (6PH1 or 6PH2): the materials of both outer packagings must meet the relevant requirements of 6.1.4.13. Solid plastics packaging must be manufactured from high density polyethylene or some other comparable plastics material. The removable lid for this type of packaging may nevertheless be in the form of a cap. |
| <b>6.1.4.21</b> | <b>RESERVED The requirements for inner packagings filled in Australia were removed from the Code in 2020.</b>                                                                                                                                                                                                                                                                               |
| <b>6.1.5</b>    | <b>TEST REQUIREMENTS FOR PACKAGINGS</b>                                                                                                                                                                                                                                                                                                                                                     |
| <b>6.1.5.1</b>  | <b>Performance and frequency of tests</b>                                                                                                                                                                                                                                                                                                                                                   |
| 6.1.5.1.1       | The design type of each packaging must be tested as provided in 6.1.5 in accordance with procedures established by the competent authority.                                                                                                                                                                                                                                                 |
| 6.1.5.1.2       | Each packaging design type must successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.                 |
| 6.1.5.1.3       | Tests must be repeated on production samples at intervals established by the competent authority. For such tests on paper or fibreboard packagings, preparation at ambient conditions is considered equivalent to the requirements of 6.1.5.2.3.                                                                                                                                            |
| 6.1.5.1.4       | Tests must also be repeated after each modification which alters the design, material or manner of construction of a packaging.                                                                                                                                                                                                                                                             |
| 6.1.5.1.5       | The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and packagings such as drums, bags and boxes which are produced with small reductions in external dimension(s).                                                                 |
| 6.1.5.1.6       | Reserved<br><b>NOTE:</b> <i>For the conditions for using different inner packagings in an outer packaging and permissible variations in inner packagings, see 4.1.1.5.1.</i>                                                                                                                                                                                                                |
| 6.1.5.1.7       | Reserved<br><b>NOTE:</b> <i>In this Code, requirements for special packagings marked “V” have been relocated to 6.1.5.1.12 to avoid confusion with headings.</i>                                                                                                                                                                                                                            |
| 6.1.5.1.8       | The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests.                                                                                                                                                                                                          |
| 6.1.5.1.9       | If an inner treatment or coating is required for safety reasons, it must retain its protective properties even after the tests.                                                                                                                                                                                                                                                             |
| 6.1.5.1.10      | Provided the validity of the test results is not affected several tests may be made on one sample.                                                                                                                                                                                                                                                                                          |

#### 6.1.5.1.11

##### Salvage packagings

Salvage packagings (see 1.2.1) must be tested and marked in accordance with the provisions applicable to packing group II packagings intended for the transport of solids or inner packagings, except as follows:

- (a) The test substance used in performing the tests must be water, and the packagings must be filled to not less than 98% of their maximum capacity. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass so long as they are placed so that the test results are not affected. Alternatively, in performing the drop test, the drop height may be varied in accordance with 6.1.5.3.5(b);
- (b) Packagings must, in addition, have been successfully subjected to the leakproofness test at 30 kPa, with the results of this test reflected in the test report required by 6.1.5.7; and
- (c) Packagings must be marked with the letter “T” as described in 6.1.2.4.

#### 6.1.5.1.12

##### Special packagings marked with “V” [UN 6.1.5.1.7]

Articles or inner packagings of any type for solids or liquids may be assembled and transported without testing in an outer packaging under the following conditions:

- (a) The outer packaging must have been successfully tested in accordance with 6.1.5.3 with fragile (e.g. glass) inner packagings containing liquids using the packing group I drop height;
- (b) The total combined gross mass of inner packagings must not exceed one half the gross mass of inner packagings used for the drop test in (a) above;
- (c) The thickness of cushioning material between inner packagings and between inner packagings and the outside of the packaging must not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single inner packaging was used in the original test, the thicknesses of cushioning between inner packagings must not be less than the thickness of cushioning between the outside of the packaging and the inner packaging in the original test. If either fewer or smaller inner packagings are used (as compared to the inner packagings used in the drop test), sufficient additional cushioning material must be used to take up void spaces;
- (d) The outer packaging must have passed successfully the stacking test in 6.1.5.6 while empty. The total mass of identical packages must be based on the combined mass of inner packagings used for the drop test in (a) above;
- (e) Inner packagings containing liquids must be completely surrounded with a sufficient quantity of absorbent material to absorb the entire liquid contents of the inner packagings;
- (f) if the outer packaging is intended to contain inner packagings for liquids and is not leakproof, or is intended to contain inner packagings for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage must be provided in the form of a leakproof liner, plastics bag or other equally efficient

means of containment. For packagings containing liquids, the absorbent material required in (e) above must be placed inside the means of containing the liquid contents;

- (g) For air transport, packagings must comply with 4.1.1.4.1;
- (h) Packagings must be marked in accordance with 6.1.3 as having been tested to packing group I performance for combination packagings. The marked gross mass in kilograms must be the sum of the mass of the outer packaging plus one half of the mass of the inner packaging(s) as used for the drop test referred to in (a) above. Such a packaging mark must also contain a letter “V” as described in 6.1.2.4.

## 6.1.5.2

### Preparation of packagings for testing

#### 6.1.5.2.1

Tests must be carried out on packagings prepared as for transport including, with respect to combination packagings, the inner packagings used. Inner or single receptacles or packagings other than bags must be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. Bags must be filled to the maximum mass at which they may be used. For combination packagings where the inner packaging is designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances or articles to be transported in the packagings may be replaced by other substances or articles except where this would invalidate the results of the tests. For solids, when another substance is used it must have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

#### 6.1.5.2.2

In the drop tests for liquids, when another substance is used, it must be of similar relative density and viscosity to those of the substance being transported. Water may also be used for the liquid drop test under the conditions in 6.1.5.3.5.

#### 6.1.5.2.3

Paper or fibreboard packagings must be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which must be chosen. The preferred atmosphere is  $23 \pm 2^\circ\text{C}$  and  $50\% \pm 2\%$  r.h. The two other options are  $20 \pm 2^\circ\text{C}$  and  $65\% \pm 2\%$  r.h. or  $27 \pm 2^\circ\text{C}$  and  $65\% \pm 2\%$  r.h.

**NOTE:** Average values must fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to  $\pm 5\%$  relative humidity without significant impairment of test reproducibility.

#### 6.1.5.2.4

Additional steps must be taken to ascertain that the plastics material used in the manufacture of plastics drums, plastics jerricans and composite packagings (plastics material) intended to contain liquids complies with the requirements in 6.1.1.2, 6.1.4.8.1 and 6.1.4.8.3. This may be done, for example, by submitting sample receptacles or packagings to a preliminary test extending over a long period, for example six months, during which the samples would remain filled with the substances they are intended to contain, and after which the samples must be submitted to the applicable tests listed in 6.1.5.3, 6.1.5.4, 6.1.5.5 and 6.1.5.6. For substances which may cause stress-cracking or weakening in plastics drums or jerricans, the sample, filled with the substance or another substance that is known to have at least as severe a stress-cracking influence on the plastics material in question, must be subjected to a superimposed load equivalent to the total mass of identical packages which might be stacked on it during transport. The minimum height of the stack including the test sample must be 3 metres.

### 6.1.5.3

#### Drop test

#### 6.1.5.3.1

Number of test samples (per design type and manufacturer) and drop orientation

For other than flat drops the centre of gravity must be vertically over the point of impact.

Where more than one orientation is possible for a given drop test, the orientation most likely to result in failure of the packaging must be used.

**Table 6.1.5.3.1: Number of test samples (per design type and manufacturer) and drop orientation**

| Packaging                                                                                                                                                                                            | No. of test samples                       | Drop orientation                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 6.1.5.3.2

#### Special preparation of test samples for the drop test

The temperature of the test sample and its contents must be reduced to - 18 °C or lower for the following packagings:

- (a) Plastics drums (see 6.1.4.8);
- (b) Plastics jerricans (see 6.1.4.8);
- (c) Plastics boxes other than expanded plastics boxes (see 6.1.4.13);
- (d) Composite packagings (plastics material) (see 6.1.4.19); and
- (e) Combination packagings with plastics inner packagings, other than plastics bags intended to contain solids or articles.

Where test samples are prepared in this way, the conditioning in 6.1.5.2.3 may be waived. Test liquids must be kept in the liquid state by the addition of anti-freeze if necessary.

#### 6.1.5.3.3

Removable head packagings for liquids must not be dropped until at least 24 hours after filling and closing to allow for any possible gasket relaxation.

#### 6.1.5.3.4

#### Target

The target must be a non-resilient and horizontal surface and must be:

- (a) Integral and massive enough to be immovable;
- (b) Flat with a surface kept free from local defects capable of influencing the test results;
- (c) Rigid enough to be non-deformable under test conditions and not liable to become damaged by the tests; and
- (d) Sufficiently large to ensure that the test package falls entirely upon the surface.

#### 6.1.5.3.5

#### Drop height

For solids and liquids, if the test is performed with the solid or liquid to be carried or with another substance having essentially the same physical characteristics:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| 1.8 m           | 1.2 m            | 0.8 m             |

For liquids in single packagings and for inner packagings of combination packagings, if the test is performed with water:

**NOTE:** The term water includes water/antifreeze solutions with a minimum specific gravity of 0.95 for testing at - 18 °C.

- (a) Where the substances to be transported have a relative density not exceeding 1.2:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| 1.8 m           | 1.2 m            | 0.8 m             |

- (b) Where the substances to be transported have a relative density exceeding 1.2, the drop height must be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal, as follows:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| d x 1.5 (m)     | d x 1.0 (m)      | d x 0.67 (m)      |

6.1.5.3.6

Criteria for passing the test:

6.1.5.3.6.1

Each packaging containing liquid must be leakproof when equilibrium has been reached between the internal and external pressures, except for inner packagings of combination packagings when it is not necessary that the pressures be equalised.

6.1.5.3.6.2

Where a packaging for solids undergoes a drop test and its upper face strikes the target, the test sample passes the test if the entire contents are retained by an inner packaging or inner receptacle (e.g. a plastics bag), even if the closure while retaining its containment function, is no longer sift-proof.

6.1.5.3.6.3

The packaging or outer packaging of a composite or combination packaging must not exhibit any damage liable to affect safety during transport. Inner receptacles, inner packagings, or articles must remain completely within the outer packaging and there must be no leakage of the filling substance from the inner receptacle(s) or inner packaging(s).

6.1.5.3.6.4

Neither the outermost ply of a bag nor an outer packaging may exhibit any damage liable to affect safety during transport.

6.1.5.3.6.5

A slight discharge from the closure(s) upon impact is not considered to be a failure of the packaging provided that no further leakage occurs.

6.1.5.3.6.6

No rupture is permitted in packagings for goods of Class 1 which would permit the spillage of loose explosive substances or articles from the outer packaging.

#### 6.1.5.4

#### Leakproofness test

The leakproofness test must be performed on all design types of packagings intended to contain liquids; however, this test is not required for the inner packagings of combination packagings.

- 6.1.5.4.1 Number of test samples: three test samples per design type and manufacturer.
- 6.1.5.4.2 Special preparation of test samples for the test: either vented closures must be replaced by similar non-vented closures or the vent must be sealed.
- 6.1.5.4.3 Test method and pressure to be applied: the packagings including their closures must be restrained under water for 5 minutes while an internal air pressure is applied, the method of restraint must not affect the results of the test.

The air pressure (gauge) to be applied must be:

| Packing group I                   | Packing group II                  | Packing group III                 |
|-----------------------------------|-----------------------------------|-----------------------------------|
| Not less than 30 kPa<br>(0.3 bar) | Not less than 20 kPa<br>(0.2 bar) | Not less than 20 kPa<br>(0.2 bar) |

Other methods at least equally effective may be used.

- 6.1.5.4.4 Criterion for passing the test: there must be no leakage.

## **6.1.5.5 Internal pressure (hydraulic) test**

- 6.1.5.5.1 Packagings to be tested: the internal pressure (hydraulic) test must be carried out on all design types of metal, plastics and composite packagings intended to contain liquids. This test is not required for inner packagings of combination packagings.
- 6.1.5.5.2 Number of test samples: three test samples per design type and manufacturer.
- 6.1.5.5.3 Special preparation of packagings for testing: either vented closures must be replaced by similar non-vented closures or the vent must be sealed.
- 6.1.5.5.4 Test method and pressure to be applied: metal packagings and composite packagings (glass, porcelain or stoneware) including their closures must be subjected to the test pressure for 5 minutes. Plastics packagings and composite packagings (plastics material) including their closures must be subjected to the test pressure for 30 minutes. This pressure is the one to be included in the mark required by 6.1.3.1(d). The manner in which the packagings are supported must not invalidate the test. The test pressure must be applied continuously and evenly; it must be kept constant throughout the test period. The hydraulic pressure (gauge) applied, as determined by any one of the following methods, must be:
- not less than the total gauge pressure measured in the packaging (i.e. the vapour pressure of the filling liquid and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C, multiplied by a safety factor of 1.5; this total gauge pressure must be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C;

- (b) not less than 1.75 times the vapour pressure at 50 °C of the liquid to be transported, minus 100 kPa but with a minimum test pressure of 100 kPa;
- (c) not less than 1.5 times the vapour pressure at 55 °C of the liquid to be transported, minus 100 kPa but with a minimum test pressure of 100 kPa.

6.1.5.5.5 In addition, packagings intended to contain liquids of packing group I must be tested to a minimum test pressure of 250 kPa (gauge) for a test period of 5 or 30 minutes depending upon the material of construction of the packaging.

6.1.5.5.6 The special requirements for air transport, including minimum test pressures, may not be covered in 6.1.5.5.4.

6.1.5.5.7 Criterion for passing the test: no packaging may leak.

### **6.1.5.6 Stacking test**

All design types of packagings other than bags are subject to a stacking test.

6.1.5.6.1 Number of test samples: three test samples per design type and manufacturer.

6.1.5.6.2 Test method: the test sample must be subjected to a force applied to the top surface of the test sample equivalent to the total weight of identical packages which might be stacked on it during transport; where the contents of the test sample are liquids with relative density different from that of the liquid to be transported, the force must be calculated in relation to the latter. The minimum height of the stack including the test sample must be 3 meters. The duration of the test must be 24 hours except that plastics drums, jerricans, and composite packagings 6HH1 and 6HH2 intended for liquids must be subjected to the stacking test for a period of 28 days at a temperature of not less than 40°C.

6.1.5.6.3 Criterion for passing the test: no test sample may leak. In composite packagings or combination packagings, there must be no leakage of the filling substance from the inner receptacle or inner packaging. No test sample may show any deterioration which could adversely affect transport safety or any distortion liable to reduce its strength or cause instability in stacks of packages. Plastics packagings must be cooled to ambient temperature before the assessment.

### **6.1.5.7 Test Report**

6.1.5.7.1 A test report containing at least the following particulars must be drawn up and must be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the packaging;

6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids. For plastics packagings subject to the internal pressure test in 6.1.5.5, the temperature of the water used;
9. Test descriptions and results;
10. The test report must be signed with the name and status of the signatory.

#### 6.1.5.7.2

The test report must contain statements that the packaging prepared as for transport was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report must be available to the competent authority.

## CHAPTER 6.2: REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PRESSURE RECEPTACLES, AEROSOL DISPENSERS, SMALL RECEPTACLES CONTAINING GAS (GAS CARTRIDGES) AND FUEL CELL CARTRIDGES CONTAINING LIQUEFIED FLAMMABLE GAS

### Introductory Note

*In all Australian States and Territories, the filling of cylinders is governed by other legislation relating to the use of pressure vessels. Generally this requires the manufacture, verification, filling, inspection, testing and maintenance of cylinders to be in accordance with AS 2030. Most cylinders complying with AS 2030 are not UN Pressure Receptacles and are therefore not subject to Section 6.2.2. The requirements for Non-UN Pressure Receptacles are in Section 6.2.3. (See also Introductory Note to Section 6.2.2.)*

**NOTE:** Aerosol dispensers, small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas are not subject to the requirements of 6.2.1 to 6.2.3.

### 6.2.1 GENERAL REQUIREMENTS

#### 6.2.1.1 Design and construction

- 6.2.1.1.1 Pressure receptacles must be designed, manufactured, tested and equipped in such a way as to withstand all conditions, including fatigue, to which they will be subjected during normal conditions of transport and intended use.
- 6.2.1.1.2 In recognition of scientific and technological advances, and recognising that pressure receptacles other than those that bear UN certification marks may be used on a national or regional basis, pressure receptacles conforming to requirements other than those specified in Section 6.2.2 may be used if approved by the competent authorities in the countries of transport and use. In Australia, the manufacture, verification, filling, inspection, testing and maintenance of gas cylinders must comply with AS 2030.
- 6.2.1.1.3 In no case must the minimum wall thickness be less than that specified in the design and construction technical standards.
- 6.2.1.1.4 For welded pressure receptacles, only metals of weldable quality must be welded.
- 6.2.1.1.5 The test pressure of pressure receptacle shells and bundles of cylinders must be in accordance with packing instruction P200 or AS 2030, or, for a chemical under pressure, with packing instruction P206. The test pressure for closed cryogenic receptacles must be in accordance with packing instruction P203. The test pressure of a metal hydride storage system must be in accordance with packing instruction P205. The test pressure of a cylinder shell for an adsorbed gas must be in accordance with packing instruction P208.

- 6.2.1.1.6 Cylinders or cylinder shells assembled in bundles must be structurally supported and held together as a unit. Cylinders or cylinder shells must be secured in a manner that prevents movement in relation to the structural assembly and movement that would result in the concentration of harmful local stresses. Manifold assemblies (e.g. manifold, valves and pressure gauges) must be designed and constructed such that they are protected from impact damage and forces normally encountered in transport.
- Manifolds must have at least the same test pressure as the cylinders. For toxic liquefied gases, each cylinder shell must have an isolation valve to ensure that each cylinder can be filled separately and that no interchange of cylinder contents can occur during transport.
- 6.2.1.1.7 Contact between dissimilar metals which could result in damage by galvanic action must be avoided.
- 6.2.1.1.8 Additional requirements for the construction of closed cryogenic receptacles for refrigerated liquefied gases
- 6.2.1.1.8.1 The mechanical properties of the metal used must be established for each pressure receptacle, including the impact strength and the bending coefficient
- 6.2.1.1.8.2 The pressure receptacles must be thermally insulated. The thermal insulation must be protected against impact by means of a jacket. If the space between the inner vessel and the jacket is evacuated of air (vacuum-insulation), the jacket must be designed to withstand without permanent deformation an external pressure of at least 100 kPa (1 bar) calculated in accordance with a recognised technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) gauge pressure. If the jacket is so closed as to be gas-tight (e.g. in the case of vacuum-insulation), a device must be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas-tightness of the inner vessel or its service equipment. The device must prevent moisture from penetrating into the insulation.
- 6.2.1.1.8.3 Closed cryogenic receptacles intended for the transport of refrigerated liquefied gases having a boiling point below -182 °C at atmospheric pressure must not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation where there is a risk of contact with oxygen or with oxygen enriched liquid.
- 6.2.1.1.8.4 Closed cryogenic receptacles must be designed and constructed with suitable lifting and securing arrangements.
- 6.2.1.1.9 Additional requirements for the construction of acetylene cylinders
- Cylinder shells for UN1001 acetylene, dissolved, and UN 3374 acetylene, solvent free, must be filled with a porous material, uniformly distributed, of a type that conforms to the requirements and testing specified in a standard or technical code recognised by the competent authority and which:
- (a) is compatible with the cylinder shell and does not form harmful or dangerous compounds either with the acetylene or with the solvent

- in the case of UN 1001; and
- (b) is capable of preventing the spread of decomposition of the acet-ylene in the porous material.

In the case of UN 1001, the solvent must be compatible with those parts of the cylinder that are in contact with it.

## **6.2.1.2**

### **Materials**

#### **6.2.1.2.1**

Construction materials of pressure receptacles which are in direct contact with dangerous goods must not be affected or weakened by the dangerous goods intended to be transported and must not cause a dangerous effect e.g. catalysing a reaction or reacting with the dangerous goods.

#### **6.2.1.2.2**

Pressure receptacles must be made of the materials specified in the design and construction technical standards and the applicable packing instruction for the substances intended for transport in the pressure receptacle. The materials must be resistant to brittle fracture and to stress corrosion cracking as indicated in the design and construction technical standards.

## **6.2.1.3**

### **Service equipment**

#### **6.2.1.3.1**

Service equipment subjected to pressure, excluding porous, absorbent or adsorbent material, pressure relief devices, pressure gauges or indicators, must be designed and constructed so that the burst pressure is at least 1.5 times the test pressure of the pressure receptacle.

#### **6.2.1.3.2**

Service equipment must be configured or designed to prevent damage and unintended opening that could result in the release of the pressure receptacle contents during normal conditions of handling and transport. All closures must be protected in the same manner as is required for valves in 4.1.6.1.8. Manifold piping leading to shut-off valves must be sufficiently flexible to protect the valves and the piping from shearing or releasing the pressure receptacle contents. .

#### **6.2.1.3.3**

Pressure receptacles which are not capable of being handled manually or rolled, must be fitted with handling devices (skids, rings, straps) ensuring that they can be safely handled by mechanical means and so arranged as not to impair the strength of, nor cause undue stresses, in the pressure receptacle.

#### **6.2.1.3.4**

Individual pressure receptacles must be equipped with pressure relief devices as specified in AS 2030, P200(1), P205 or 6.2.1.3.6.4 and 6.2.1.3.6.5. Pressure-relief devices must be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure. When fitted, pressure relief devices on manifolded horizontal pressure receptacles filled with flammable gas must be arranged to discharge freely to the open air in such a manner as to prevent any impingement of escaping gas upon the pressure receptacle itself under normal conditions of transport.

- 6.2.1.3.5 Pressure receptacles whose filling is measured by volume must be provided with a level indicator.
- 6.2.1.3.6 Additional requirements for closed cryogenic receptacles
- 6.2.1.3.6.1 Each filling and discharge opening in a closed cryogenic receptacle used for the transport of flammable refrigerated liquefied gases must be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve, the second being a cap or equivalent device.
- 6.2.1.3.6.2 For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure-relief must be provided to prevent excess pressure build-up within the piping.
- 6.2.1.3.6.3 Each connection on a closed cryogenic receptacle must be clearly marked to indicate its function (e.g. vapour or liquid phase).
- 6.2.1.3.6.4 Pressure-relief devices
- 6.2.1.3.6.4.1 Every closed cryogenic receptacle must be provided with at least one pressure-relief device. The pressure-relief device must be of the type that will resist dynamic forces including surge.
- 6.2.1.3.6.4.2 Closed cryogenic receptacles may, in addition, have a frangible disc in parallel with the spring loaded device(s) in order to meet the requirements of 6.2.1.3.6.5.
- 6.2.1.3.6.4.3 Connections to pressure-relief devices must be of sufficient size to enable the required discharge to pass unrestricted to the pressure-relief device.
- 6.2.1.3.6.4.4 All pressure-relief device inlets must under maximum filling conditions be situated in the vapour space of the closed cryogenic receptacle and the devices must be so arranged as to ensure that the escaping vapour is discharged unrestrictedly.
- 6.2.1.3.6.5 Capacity and setting of pressure-relief devices
- NOTE:** *In relation to pressure-relief devices of closed cryogenic receptacles, MAWP means the maximum effective gauge pressure permissible at the top of a loaded closed cryogenic receptacle in its operating position including the highest effective pressure during filling and discharge.*
- 6.2.1.3.6.5.1 The pressure-relief device must open automatically at a pressure not less than the MAWP and be fully open a pressure equal to 110% of the MAWP. It must, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and must remain closed at all lower pressures.
- 6.2.1.3.6.5.2 Frangible discs must be set to rupture at a nominal pressure which is the lower of either the test pressure or 150% of the MAWP.
- 6.2.1.3.6.5.3 In the case of the loss of vacuum in a vacuum-insulated closed cryogenic receptacle the combined capacity of all pressure-relief devices installed must be sufficient so that the pressure (including accumulation) inside the closed cryogenic receptacle does not exceed 120% of the MAWP.

6.2.1.3.6.5.4 The required capacity of the pressure-relief devices must be calculated in accordance with an established technical code recognised by the competent authority<sup>1</sup>

#### **6.2.1.4 Approval of pressure receptacles**

6.2.1.4.1 The conformity of pressure receptacles must be assessed at time of manufacture as required by the competent authority. The technical documentation must include full specifications on design and construction, and full documentation on the manufacturing and testing.

6.2.1.4.2 Quality assurance systems must conform to the requirements of the competent authority.

6.2.1.4.3 Pressure receptacle shells and the inner vessels of closed cryogenic receptacles must be inspected tested and approved by an inspection body.

6.2.1.4.4 For refillable cylinders, pressure drums and tubes the conformity assessment of the shell and the closure(s) may be carried out separately. In these cases, an additional assessment of the final assembly is not required.

For bundles of cylinders, the cylinder shells and the valve(s) may be assessed separately, but an additional assessment of the completed assembly is required.

For closed cryogenic receptacles, the inner vessels and the closures may be assessed separately, but an additional assessment of the completed assembly is required:

For acetylene cylinders, conformity assessment shall comprise either:

- (a) One assessment of conformity covering both the cylinder shell and the contained porous material; or
- (b) A separate assessment of conformity for the empty cylinder shell and an additional assessment of conformity covering the cylinder shell with the contained porous material.

#### **6.2.1.5 Initial inspection and test**

6.2.1.5.1 New pressure receptacles, other than closed cryogenic receptacles, metal hydride storage systems and bundles of cylinders, must be subjected to testing and inspection during and after manufacture in accordance with the applicable design standards or recognised technical codes including the following:

On an adequate sample of pressure receptacle shells:

- (a) Testing of the mechanical characteristics of the material of construction;
- (b) Verification of the minimum wall thickness;

---

<sup>1</sup> See for example CGA Publications S-1.2-2003 “Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases” and S-1.1-2003 “Pressure Relief Device Standards - Part 1 - Cylinders for Compressed Gases”.

- (c) Verification of the homogeneity of the material for each manufacturing batch;
- (d) Inspection of the external and internal conditions;
- (e) Inspection of the threads used to fit closures;
- (f) Verification of the conformance with the design standard;

For all pressure receptacle shells:

- (g) A hydraulic pressure test. Pressure receptacle shells shall meet the acceptance criteria specified in the design and construction technical standard or technical code;

**NOTE:** *With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.*

- (h) Inspection and assessment of manufacturing defects and either repairing them or rendering the pressure receptacle shells unserviceable. In the case of welded pressure receptacle shells, particular attention must be paid to the quality of the welds;
- (i) An inspection of the marks on the pressure receptacle shells;
- (j) In addition, cylinder shells intended for the transport of UN 1001 acetylene, dissolved, and UN 3374 acetylene, solvent free, must be inspected to ensure proper installation and condition of the porous material and, if applicable, the quantity of solvent.

On an adequate sample of closures:

- (k) Verification of materials;
- (l) Verification of dimensions;
- (m) Verification of cleanliness;
- (n) Inspection of completed assembly;
- (o) Verification of the presence of marks.

For all completed closed cryogenic pressure receptacles:

- (p) Testing for leakproofness.

#### 6.2.1.5.2

Closed cryogenic receptacles must be subjected to testing and inspection during and after manufacture in accordance with the applicable design standards or recognised technical codes including the following:

On an adequate sample of inner vessels:

- (a) Testing of the mechanical characteristics of the material of construction;
- (b) Verification of the minimum wall thickness;
- (c) Inspection of the external and internal conditions;
- (d) Verification of the conformance with the design standard or technical code;
- (e) Inspection of welds by radiographic, ultrasonic or other suitable non-destructive test method according to the applicable design and construction standard or technical code.

For all inner vessels:

- (f) A hydraulic pressure test. The inner vessel must meet the acceptance criteria specified in the design and construction technical standard or technical code;

**NOTE:** *With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.*

- (g) Inspection and assessment of manufacturing defects and either repairing them or rendering the inner vessel unserviceable;
- (h) An inspection of the marks.

On an adequate sample of closures:

- (i) Verification of materials;
- (j) Verification of dimensions;
- (k) Verification of cleanliness;
- (l) Inspection of completed assembly;
- (m) Verification of the presence of marks.

For all closures:

- (n) Testing for leakproofness.

On an adequate sample of completed closed cryogenic receptacles:

- (o) Testing the satisfactory operation of service equipment;
- (p) Verification of the conformance with the design standard or code.

For all completed closed cryogenic receptacles:

- (q) Testing for leakproofness.

**NOTE:** *Closed cryogenic receptacles which were constructed in accordance with the initial inspection and test requirements of 6.2.1.5.2 applicable in the twenty-first revised edition of the Model Regulations but which do not however conform to the requirements of 6.2.1.5.2 relating to the initial inspection and test applicable in the twenty-second revised edition of the Model Regulations, may continue to be used.*

#### 6.2.1.5.3

For metal hydride storage systems, it must be verified that the inspections and tests specified in 6.2.1.5.1 (a), (b), (c), (d), (e) if applicable, (f), (g), (h) and (i) have been performed on an adequate sample of the pressure receptacle shells used in the metal hydride storage system. In addition, on an adequate sample of metal hydride storage systems, the inspections and tests specified in 6.2.1.5.1 (c) and (f) must be performed, as well as 6.2.1.5.1 (e), if applicable, and inspection of the external conditions of the metal hydride storage system.

Additionally, all metal hydride storage systems must undergo the initial inspections and tests specified in 6.2.1.5.1 (h) and (i), as well as a leakproofness test and a test of the satisfactory operation of the service equipment.

#### 6.2.1.5.4

For bundles of cylinders the cylinder shells and closures shall be subjected to initial inspection and tests specified in 6.2.1.5.1. An adequate sample of frames shall be proof load tested to two times the maximum gross weight of the bundles of cylinders.

Additionally, all manifolds of bundles of cylinders must undergo a hydraulic pressure test and all completed bundles of cylinders must undergo a leakproofness test.

**NOTE:** With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.

## 6.2.1.6

### Periodic inspection and test

#### 6.2.1.6.1

Refillable pressure receptacles, other than cryogenic receptacles, must be subjected to periodic inspections and tests by a body authorised by the competent authority, in accordance with the following:

- (a) Check of the external conditions of the pressure receptacle and verification of the equipment and the external marks;
- (b) Check of the internal conditions of the pressure receptacle (e.g. internal inspection, verification of minimum wall thickness);
- (c) Checking of the threads either:
  - (i) if there is evidence of corrosion; or
  - (ii) if the closures or other service equipment are removed;
- (d) A hydraulic pressure test of the receptacle shell and, if necessary, verification of the characteristics of the material by suitable tests;

**NOTE 1:** With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.

**NOTE 2:** For seamless steel cylinder shells and tube shells the check of 6.2.1.6.1 (b) and hydraulic pressure test of 6.2.1.6.1 (d) may be replaced by a procedure conforming to ISO 16148:2016 + Amd 1:2020 “Gas cylinders – Refillable seamless steel gas cylinders and tubes – Acoustic emission examination (AT) and follow-up ultrasonic examination (UT) for periodic inspection and testing”.

**NOTE 3:** The check of internal conditions of 6.2.1.6.1 (b) and the hydraulic pressure test of 6.2.1.6.1 (d) may be replaced by ultrasonic examination carried out in accordance with ISO 18119:2018 + Amd 1:2021 for seamless aluminium alloy gas cylinder shells. For a transitional period until 31 December 2026 the standard ISO 18119:2018 may be used for this same purpose. For a transitional period until 31 December 2024 the standard ISO 10461:2005 + Amd 1:2006 may be used for seamless aluminium alloy cylinder shells and ISO 6406:2005 may be used for seamless steel cylinder shells for this same purpose.

**NOTE 4:** For bundles of cylinders the hydraulic test specified in (d) above must be carried out on the cylinders shells and on the manifold.

- (e) Check of service equipment, if to be reintroduced into service. This check may be carried out separately from the inspection of the pressure receptacle shell;
- (f) A leakproofness test of bundles of cylinders after reassembly.

**NOTE:** For the periodic inspection and test frequencies, see packing instruction P200 or, for a chemical under pressure, packing instruction P206 of 4.1.4.1.

- 6.2.1.6.2 Cylinders intended for the transport of UN 1001 acetylene, dissolved and UN 3374 acetylene, solvent free, must be examined only as specified in 6.2.1.6.1 (a), (c) and (e). In addition the condition of the porous material (e.g. cracks, top clearance, loosening, settlement) shall be examined.
- 6.2.1.6.3 Pressure relief valves for closed cryogenic receptacles must be subject to periodic inspections and tests
- 6.2.1.7 Requirements for manufacturers**
- 6.2.1.7.1 The manufacturer must be technically able and must possess all resources required for the satisfactory manufacture of pressure receptacles; this relates in particular to qualified personnel:
- (a) to supervise the entire manufacturing process;
  - (b) to carry out joining of materials; and
  - (c) to carry out the relevant tests.
- 6.2.1.7.2 A proficiency test of the manufacturers of pressure receptacle shells and the inner vessels of closed cryogenic receptacle must in all instances be carried out by an inspection body approved by the competent authority of the jurisdiction of approval. Proficiency testing of manufacturers of closures must be carried out if the competent authority requires it. This test must be carried out either during design type approval or during production inspection and certification.
- 6.2.1.8 Requirements for inspection bodies**
- 6.2.1.8.1 Inspection bodies must be independent from manufacturing enterprises and competent to perform the tests, inspections and approvals required.
- 6.2.1.8.2 The application of 6.2.1.8.1 is subject to the relevant Australian Standards under which inspection is required.

## **6.2.2 REQUIREMENTS FOR UN PRESSURE RECEPTACLES**

### **Introductory note**

This Section applies to those cylinders and other pressure receptacles that fully meet the requirements specified in UN (ISO) pressure receptacles Standards. In Australia, most cylinders covered by AS 2030 are not UN (ISO) pressure receptacles. Rather they are Australian Standard [AS], American/Canadian [DOT/CTC] or British Standard [BS] cylinders. For these, the technical detail of Section 6.2.2 does not apply, as their design and operational requirements must follow AS 2030 and its subordinate Standards. The requirements for Non-UN (ISO) pressure receptacles are in Section 6.2.3.

Therefore:

Cylinders meeting UN (ISO) Standards must comply with Section 6.2.2 and be filled and used in accordance with Packing Provision P200;

All other cylinders must comply with Section 6.2.3 and be filled and used in accordance with AS 2030 and its subordinate Standards.

In addition to the general requirements of section 6.2.1, UN pressure receptacles must comply with the requirements of this section, including the standards, as applicable.

Manufacture of new pressure receptacles or service equipment according to any particular standard in 6.2.2.1 and 6.2.2.3 is not permitted after the date shown in the right hand column of the tables.

**NOTE 1:** *With the agreement of the competent authority, more recently published versions of the standards, if available, may be used.*

**NOTE 2:** *UN pressure receptacles constructed according to standards applicable at the date of manufacture may continue in use subject to the periodic inspection provisions of this Code.*

## 6.2.2.1

### Design, construction and initial inspection and test

#### 6.2.2.1.1

The following standards apply for the design, construction, and initial inspection and test of refillable UN cylinder shells, except that inspection requirements related to the conformity assessment system and approval must be in accordance with 6.2.2.5:

| Reference       | Title                                                                                                                                                                                                                                                                                                                 | Applicable for Manufacture |

**NOTE 1:** In the above referenced standards composite cylinder shells must be designed for a design life of not less than 15 years.

**NOTE 2:** Composite cylinder shells with a design life longer than 15 years must not be filled after 15 years from the date of manufacture, unless the design has successfully passed a service life test programme. The programme must be part of the initial design type approval and must specify inspections and tests to demonstrate that composite cylinder shells manufactured accordingly remain safe to the end of their design life. The service life test programme and the results must be approved by the competent authority of the country of approval that is responsible for the initial approval of the cylinder design. The service life of a composite cylinder shell must not be extended beyond its initial approved design life.

#### 6.2.2.1.2

The following standards apply for the design, construction, and initial inspection and test of UN tube shells, except that inspection requirements related to the conformity assessment system and approval must be in accordance with 6.2.2.5.

| ISO 9809-2:2019 | Gas cylinders – Design, construction and testing of refillable seamless steel gas cylinders and tubes – Part 2: Quenched and tempered steel cylinders and tubes with tensile strength greater than or equal to MPa | Until further notice |
| ISO 9809-3:2019 | Gas cylinders – Design, construction and testing of refillable seamless steel gas cylinders and tubes – Part 3: Normalized steel cylinders and tubes                                                               | Until further notice |

**NOTE 1:** In the above referenced standards composite tube shells must be designed for a design life of not less than 15 years.

**NOTE 2:** Composite tube shells with a design life longer than 15 years must not be filled after 15 years from the date of manufacture, unless the design has successfully passed a service life test programme. The programme must be part of the initial design type approval and must specify inspections and tests to demonstrate that composite tube shells manufactured accordingly remain safe to the end of their design life. The service life test programme and the results must be approved by the competent authority of the country of approval that is responsible for the initial approval of the tube design. The service life of a composite tube shell must not be extended beyond its initial approved design life.

#### 6.2.2.1.3

The following standards apply for the design, construction and initial inspection and test of UN acetylene cylinders, except that inspection requirements related to the conformity assessment system and approval must be in accordance with 6.2.2.5:

For the cylinder shell:

| ISO 7866:2012 + Cor 1:2014 | Gas cylinders – Refillable seamless aluminum alloy gas cylinders – Design, construction and testing<br><br><b>NOTE:</b> Aluminum alloy 6351A or equivalent shall not be used                                                                                                                                   | Until further notice            |

For acetylene cylinder including the porous material:

| Reference       | Title                                                                                  | Applicable for manufacture |
|-----------------|----------------------------------------------------------------------------------------|----------------------------|
| ISO 3807-1:2000 | Cylinders for acetylene – Basic requirements – Part 1: Cylinders without fusible plugs | Until 31 December 2020     |
| ISO 3807-2:2000 | Cylinders for acetylene – Basic requirements – Part 2: Cylinders with fusible plugs    | Until 31 December 2020     |
| ISO 3807:2013   | Gas cylinders – Acetylene cylinders – Basic requirements and type testing              | Until further notice       |

- 6.2.2.1.4 The following standard applies for the design, construction and initial inspection and test of UN closed cryogenic receptacles, except that inspection requirements related to the conformity assessment system and approval must be in accordance with 6.2.2.5:

| Reference                    | Title                                                                                                                                               | Applicable for manufacture |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| ISO 21029-1:2004             | Cryogenic vessels - Transportable vacuum insulated vessels of not more than 1000 L volume - Part 1: Design, fabrication, inspection and tests       | Until 31 December 2026     |
| ISO 21029-1:2018 + Amd1:2019 | Cryogenic vessels – Transportable vacuum insulated vessels of not more than 1 000 litres volume – Part 1: Design, fabrication, inspection and tests | Until further notice       |

- 6.2.2.1.5 The following standards apply for the design, construction, and initial inspection and test of UN metal hydride storage systems, except that inspection requirements related to the conformity assessment system and approval must be in accordance with 6.2.2.5:

| Reference      | Title                                                                             | Applicable for manufacture |
|----------------|-----------------------------------------------------------------------------------|----------------------------|
| ISO 16111:2008 | Transportable gas storage devices - Hydrogen absorbed in reversible metal hydride | Until 31 December 2026     |
| ISO 16111:2018 | Transportable gas storage devices - Hydrogen absorbed in reversible metal hydride | Until further notice       |

- 6.2.2.1.6 The following standard applies for the design, construction and initial inspection and test of UN bundles of cylinders. Each cylinder in a UN bundle of cylinders must be a UN cylinder or UN cylinder shell complying with the requirements of 6.2.2. The inspection requirements related to the conformity assessment system and approval for UN bundles of cylinders must be in accordance with 6.2.2.5.

| Reference      | Title                                                                          | Applicable for manufacture |
|----------------|--------------------------------------------------------------------------------|----------------------------|
| ISO 10961:2010 | Gas cylinders – Cylinder bundles – Design, manufacture, testing and inspection | Until 31 December 2026     |
| ISO 10961:2019 | Gas cylinders – Cylinder bundles – Design, manufacture, testing and inspection | Until further notice       |

**NOTE:** Changing one or more cylinders or cylinder shells of the same design type, including the same test pressure, in an existing UN bundle of cylinders does not require a new conformity assessment of the existing bundle. Service equipment of the bundled of cylinders can also be replaced without requiring a new conformity assessment if it complies with the design type approval.

## 6.2.2.1.7

The following standards apply for the design, construction and initial inspection and test of UN cylinders for adsorbed gases except that the inspection requirements related to the conformity assessment system and approval must be in accordance with 6.2.2.5.

| Reference       | Title                                                                                                                                                                                                    | Applicable for manufacture |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| ISO 11513:2011  | Gas cylinders – Refillable welded steel cylinders containing materials for sub-atmospheric gas packaging (excluding acetylene) – Design, construction, testing, use and periodic inspection              | Until 31 December 2026     |
| ISO 11513:2019  | Gas cylinders – Refillable welded steel cylinders containing materials for sub-atmospheric gas packaging (excluding acetylene) – Design, construction, testing, use and periodic inspection              | Until further notice       |
| ISO 9809-1:2010 | Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1100 MPa                      | Until 31 December 2026     |
| ISO 9809:2019   | Gas cylinders – Design, construction and testing of refillable seamless steel gas cylinders and tubes – Part 1: Quenched and tempered steel cylinders and tubes with tensile strength less than 1100 MPa | Until further notice       |

## 6.2.2.1.8

The following standards apply for the design, construction and initial inspection and test of UN pressure drums, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

| Reference                     | Title                                                                                                                                                                                                                                                                                                                                                                                                                                  | Applicable for manufacture |

| ISO 21172-1:2015              | Gas cylinders – Welded steel pressure drums up to 3 000 litres capacity for the transport of gases – Design and construction – Part 1: Capacities up to 1 000 litres<br><br><b>NOTE:</b> <i>Irrespective of section 6.3.3.4 of this standard, welded steel gas pressure drums with dished ends convex to pressure may be used for the transport of corrosive substances provided all applicable requirements of this Code are met.</i> | Until 31 December 2026     |
| ISO 21172-1:2015 + Amd 1:2018 | Gas cylinders – Welded steel pressure drums up to 3 000 litres capacity for the transport of gases – Design and construction – Part 1: Capacities up to 1 000 litres                                                                                                                                                                                                                                                                   | Until further notice       |
| ISO 4706: 2008                | Gas cylinders – Refillable welded steel cylinders                                                                                                                                                                                                                                                                                                                                                                                      | Until further              |

|                  |                                                                                                      |                      |
|------------------|------------------------------------------------------------------------------------------------------|----------------------|
|                  | – Test pressure 60 bar and below;                                                                    | notice               |
| ISO 18172-1:2007 | Gas cylinders – Refillable welded stainless steel cylinders – Part 1: Test pressure 6 MPa and below. | Until further notice |

6.2.2.1.9 The following standards apply for the design, construction and initial inspection and test of non-refillable UN cylinders except that the inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

| Reference                   | Title                                                                                                            | Applicable for manufacture |
|-----------------------------|------------------------------------------------------------------------------------------------------------------|----------------------------|
| ISO 11118:1999              | Gas cylinders – Non-refillable metallic gas cylinders - Specification and test methods                           | Until 31 December 2020     |
| ISO 13340:2001              | Transportable gas cylinders - Cylinder valves for non-refillable cylinders - Specification and prototype testing | Until 31 December 2020     |
| ISO 11118:2015              | Gas cylinders – Non-refillable metallic gas cylinders - Specification and test methods                           | Until 31 December 2026     |
| ISO 11118:2015 + Amd 1:2019 | Gas cylinders – Non-refillable metallic gas cylinders - Specification and test methods.                          | Until further notice       |

## 6.2.2.2 Materials

In addition to the material requirements specified in the design and construction standards, and any restrictions specified in the applicable packing instruction for the gas(es) to be transported (e.g. packing instruction P200 or P205), the following standards apply to material compatibility:

**Table 6.2.2.2: Materials - Pressure Receptacles**

| Reference        | Title                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| ISO 11114-1:2020 | Gas cylinders – Compatibility of cylinder and valve materials with gas contents – Part 1: Metallic materials    |
| ISO 11114-2:2021 | Gas cylinders- Compatibility of cylinder and valve materials with gas contents – Part 2: Non-metallic materials |

## 6.2.2.3 Closures and their protection

The following standards apply to the design, construction, and initial inspection and test of closures and their protection:

**Table 6.2.2.3: Service Equipment - Pressure Receptacles**

| Reference | Title | Applicable for Man- |
|-----------|-------|---------------------|
|-----------|-------|---------------------|

|                              |                                                                                                                                                                                        |                        |

| ISO 20475:2018 | Gas cylinders – Cylinder bundles – Periodic inspection and testing                                                                                                                                       | Until further notice   |
| ISO 23088:2020 | Gas cylinders – Periodic inspection and testing of welded steel pressure drums – capacity up to 1000L                                                                                                    | Until further notice   |

The following standard applies to the periodic inspection and testing of UN metal hydride storage systems:

|                |                                                                                   |                        |
|----------------|-----------------------------------------------------------------------------------|------------------------|
| ISO 16111:2008 | Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride | Until 31 December 2024 |
| ISO 16111:2018 | Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride | Until further notice   |

### 6.2.2.5 Conformity assessment system and approval for manufacture of pressure receptacles

#### 6.2.2.5.0

##### Definitions

For the purposes of this section:

**Conformity assessment system** means a system for competent authority approval of a manufacturer, by pressure receptacle design type approval, approval of manufacturer's quality system and approval of inspection bodies;

**Design type** means a pressure receptacle design as specified by a particular pressure receptacle standard;

**Verify** means confirm by examination or provision of objective evidence that specified requirements have been fulfilled.

**NOTE:** *In this subsection when separate assessment is used the term pressure receptacle shall refer to pressure receptacle, pressure recept-*

*acle shell, inner vessel of the closed cryogenic receptacle or closure, as appropriate.*

6.2.2.5.1 The requirements of 6.2.2.5 must be used for the conformity assessment of pressure receptacles. Paragraph 6.2.1.4.4 gives details of which parts of pressure receptacles may be conformity assessed separately. However, the requirements of 6.2.2.5 may be replaced by requirements specified by the competent authority if the following cases:

- (a) conformity assessment of closures;
- (b) conformity assessments of the complete assembly of bundles of cylinders provided the cylinder shells have been conformity assessed in accordance with the requirements of 6.2.2.5; and
- (c) conformity assessment of the complete assembly of closed cryogenic receptacles provided the inner vessel has been conformity assessed in accordance with the requirements of 6.2.2.5.

6.2.2.5.2 *General requirements*

*Competent authority*

6.2.2.5.2.1 The competent authority that approves the pressure receptacle must approve the conformity assessment system for the purpose of ensuring that pressure receptacles conform to the requirements of this Code. In instances where the competent authority that approves a pressure receptacle is not the competent authority in the country of manufacture, the marks of the approval country and the country of manufacture must be indicated in the pressure receptacle marks (see 6.2.2.7 and 6.2.2.8). The competent authority of the country of approval must supply, upon request, evidence demonstrating compliance to this conformity assessment system to its counterpart in a country of use.

6.2.2.5.2.2 The competent authority may delegate its functions in this conformity assessment system in whole or in part.

6.2.2.5.2.3 The competent authority must ensure that a current list of approved inspection bodies and their identity marks and approved manufacturers and their identity marks is available.

*Inspection body*

6.2.2.5.2.4 The inspection body must be approved by the competent authority for the inspection of pressure receptacles and must:

- (a) have a staff with an organisational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
- (b) have access to suitable and adequate facilities and equipment;
- (c) operate in an impartial manner and be free from any influence which could prevent it from doing so;
- (d) ensure commercial confidentiality of the commercial and proprietary activities of the manufacturer and other bodies;
- (e) maintain clear demarcation between actual inspection body functions and unrelated functions;
- (f) operate a documented quality system;
- (g) ensure that the tests and inspections specified in the relevant pressure receptacle standard and this Code are performed; and

- (h) maintain an effective and appropriate report and record system in accordance with 6.2.2.5.6.
- 6.2.2.5.2.5 The inspection body must perform design type approval, pressure receptacle production testing and inspection, and certification to verify conformity with the relevant pressure receptacle standard (see 6.2.2.5.4 and 6.2.2.5.5).
- Manufacturer*
  - 6.2.2.5.2.6 The manufacturer must:
    - (a) operate a documented quality system in accordance with 6.2.2.5.3;
    - (b) apply for design type approvals in accordance with 6.2.2.5.4;
    - (c) select an inspection body from the list of approved inspection bodies maintained by the competent authority in the country of approval; and
    - (d) maintain records in accordance with 6.2.2.5.6.
  - Testing laboratory*
  - 6.2.2.5.2.7 The testing laboratory must have:
    - (a) staff with an organisational structure, sufficient in number, competence, and skill; and
    - (b) suitable and adequate facilities and equipment to perform the tests required by the manufacturing standard to the satisfaction of the inspection body.
- 6.2.2.5.3 Manufacturer's quality system
- 6.2.2.5.3.1 The quality system must contain all the elements, requirements, and provisions adopted by the manufacturer. It must be documented in a systematic and orderly manner in the form of written policies, procedures and instructions.
 

The contents must in particular include adequate descriptions of:

  - (a) the organisational structure and responsibilities of personnel with regard to design and product quality;
  - (b) the design control and design verification techniques, processes, and procedures that will be used when designing the pressure receptacles;
  - (c) the relevant pressure receptacle manufacturing, quality control, quality assurance and process operation instructions that will be used;
  - (d) quality records, such as inspection reports, test data and calibration data;
  - (e) management reviews to ensure the effective operation of the quality system arising from the audits in accordance with 6.2.2.5.3.2;
  - (f) the process describing how customer requirements are met;
  - (g) the process for control of documents and their revision;
  - (h) the means for control of non-conforming pressure receptacles, purchased components, in-process and final materials; and
  - (i) training programmes and qualification procedures for relevant personnel.
- 6.2.2.5.3.2 Audit of the quality system

The quality system must be initially assessed to determine whether it meets the requirements in 6.2.2.5.3.1 to the satisfaction of the competent authority.

The manufacturer must be notified of the results of the audit. The notification must contain the conclusions of the audit and any corrective actions required.

Periodic audits must be carried out, to the satisfaction of the competent authority, to ensure that the manufacturer maintains and applies the quality system. Reports of the periodic audits must be provided to the manufacturer.

#### 6.2.2.5.3.3

##### Maintenance of the quality system

The manufacturer must maintain the quality system as approved in order that it remains adequate and efficient. The manufacturer must notify the competent authority that approved the quality system, of any intended changes. The proposed changes must be evaluated in order to determine whether the amended quality system will still satisfy the requirements in 6.2.2.5.3.1.

#### 6.2.2.5.4

##### Approval process

##### Initial design type approval

#### 6.2.2.5.4.1

The initial design type approval must consist of approval of the manufacturer's quality system and approval of the pressure receptacle design to be produced. An application for an initial design type approval must meet the requirements of 6.2.2.5.4.2 to 6.2.2.5.4.6 and 6.2.2.5.4.9.

#### 6.2.2.5.4.2

A manufacturer desiring to produce pressure receptacles in accordance with a pressure receptacle standard and this Code must apply for, obtain, and retain a design type approval certificate issued by the competent authority in the country of approval for at least one pressure receptacle design type in accordance with the procedure given in 6.2.2.5.4.9. This certificate must, on request, be submitted to the competent authority of the country of use.

#### 6.2.2.5.4.3

An application must be made for each manufacturing facility and must include:

- (a) the name and registered address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) the address of the manufacturing facility (if different from the above);
- (c) the name and title of the person(s) responsible for the quality system;
- (d) the designation of the pressure receptacle and the relevant pressure receptacle standard;
- (e) details of any refusal of approval of a similar application by any other competent authority;
- (f) the identity of the inspection body for design type approval;
- (g) documentation on the manufacturing facility as specified under 6.2.2.5.3.1; and
- (h) the technical documentation required for design type approval, which must enable verification of the conformity of the pressure

receptacles with the requirements of the relevant pressure receptacle design standard. The technical documentation must cover the design and method of manufacture and must contain, as far as is relevant for assessment, at least the following:

- (i) pressure receptacle design standard, design and manufacturing drawings, showing components and sub-assemblies, if any;
- (ii) descriptions and explanations necessary for the understanding of the drawings and intended use of the pressure receptacles;
- (iii) a list of the standards necessary to fully define the manufacturing process;
- (iv) design calculations and material specifications; and
- (v) design type approval test reports, describing the results of examinations and tests carried out in accordance with 6.2.2.5.4.9.

6.2.2.5.4.4 An initial audit in accordance with 6.2.2.5.3.2 must be performed to the satisfaction of the competent authority.

6.2.2.5.4.5 If the manufacturer is denied approval, the competent authority must provide written detailed reasons for such denial.

6.2.2.5.4.6 Following approval, changes to the information submitted under 6.2.2.5.4.3 relating to the initial approval must be provided to the competent authority.

*Subsequent design type approvals*

6.2.2.5.4.7 An application for a subsequent design type approval must encompass the requirements of 6.2.2.5.4.8 and 6.2.2.5.4.9, provided a manufacturer is in the possession of an initial design type approval. In such a case, the manufacturer's quality system according to 6.2.2.5.3 must have been approved during the initial design type approval and must be applicable for the new design.

6.2.2.5.4.8 The application must include:

- (a) the name and address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) details of any refusal of approval of a similar application by any other competent authority;
- (c) evidence that initial design type approval has been granted; and
- (d) the technical documentation, as described in 6.2.2.5.4.3(h).

*Procedure for design type approval*

6.2.2.5.4.9 The inspection body must:

- (a) examine the technical documentation to verify that:
  - (i) the design is in accordance with the relevant provisions of the standard, and
  - (ii) the prototype lot has been manufactured in conformity with the technical documentation and is representative of the design;

- (b) verify that the production inspections have been carried out as required in accordance with 6.2.2.5.5;
- (c) as required by the pressure receptacle standard or technical code, carry out or supervise the tests of pressure receptacles as required for the design type approval;
- (d) perform or have performed the examinations and tests specified in the pressure receptacle standard to determine that:
  - (i) the standard has been applied and fulfilled, and
  - (ii) the procedures adopted by the manufacturer meet the requirements of the standard; and
- (e) ensure that the various type approval examinations and tests are correctly and competently carried out.

After prototype testing has been carried out with satisfactory results and all applicable requirements of 6.2.2.5.4 have been satisfied, a design type approval certificate must be issued, which must include the name and address of the manufacturer, results and conclusions of the examination, and the necessary data for identification of the design type. If it was not possible to evaluate exhaustively the compatibility of the materials of construction with the contents of the pressure receptacle when the certificate was issued, a statement that compatibility assessment was not completed must be included in the design type approval certificate.

If the manufacturer is denied a design type approval, the competent authority must provide written detailed reasons for such denial.

#### 6.2.2.5.4.10

##### Modifications to approved design types

The manufacturer must either:

- (a) inform the issuing competent authority of modifications to the approved design type where such modifications do not constitute a new design, as specified in the pressure receptacle standard; or
- (b) request a subsequent design type approval where such modifications constitute a new design according to the relevant pressure receptacle standard. This additional approval must be given in the form of an amendment to the original design type approval certificate.

#### 6.2.2.5.4.11

Upon request, the competent authority must communicate to any other competent authority, information concerning design type approval, modifications of approvals and withdrawn approvals.

#### 6.2.2.5.5

##### Production inspection and certification

##### General requirements

An inspection body, or its delegate, must carry out the inspection and certification of each pressure receptacle. The inspection body selected by the manufacturer for inspection and testing during production may be different from the inspection body used for the design type approval testing.

Where it can be demonstrated to the satisfaction of the inspection body that the manufacturer has trained competent inspectors, independent of the manufacturing operations, inspection may be performed by those

inspectors. In such a case, the manufacturer must maintain training records of the inspectors.

The inspection body must verify that the inspections by the manufacturer, and tests performed on those pressure receptacles, fully conform to the standard and the requirements of this Code. Should non-conformance in conjunction with this inspection and testing be determined, the permission to have inspection performed by the manufacturer's inspectors may be withdrawn.

The manufacturer must, after approval by the inspection body, make a declaration of conformity with the certified design type. The application of the pressure receptacle certification marks must be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of this conformity assessment system and this Code. The inspection body must affix or delegate the manufacturer to affix the pressure receptacle certification marks and the registered mark of the inspection body to each approved pressure receptacle.

A certificate of compliance, signed by the inspection body and the manufacturer, must be issued before the pressure receptacles are filled.

#### 6.2.2.5.6

##### Records

Design type approval and certificate of compliance records must be retained by the manufacturer and the inspection body for not less than 20 years.

### 6.2.2.6

## **Approval system for periodic inspection and test of pressure receptacles**

#### 6.2.2.6.1

##### Definition

For the purposes of this section:

**Approval system** means a system for competent authority approval of a body performing periodic inspection and test of pressure receptacles (hereinafter referred to as “periodic inspection and test body”), including approval of that body’s quality system.

#### 6.2.2.6.2

##### General requirements

##### *Competent authority*

#### 6.2.2.6.2.1

The competent authority must establish an approval system for the purpose of ensuring that the periodic inspection and test of pressure receptacles conform to the requirements of this Code. In instances where the competent authority that approves a body performing periodic inspection and test of a pressure receptacle is not the competent authority of the country approving the manufacture of the pressure receptacle, the marks of the approval country of periodic inspection and test must be indicated in the pressure receptacle marks (see 6.2.2.7).

The competent authority of the country of approval for the periodic inspection and test must supply, upon request, evidence demonstrating

compliance to this approval system including the records of the periodic inspection and test to its counterpart in a country of use.

The competent authority of the country of approval may terminate the approval certificate referred to in 6.2.2.6.4.1, upon evidence demonstrating non-compliance with the approval system.

- 6.2.2.6.2.2 The competent authority may delegate its functions in this approval system, in whole or in part.
- 6.2.2.6.2.3 The competent authority must ensure that a current list of approved periodic inspection and test bodies and their identity marks is available.

*Periodic inspection and test body*

- 6.2.2.6.2.4 The periodic inspection and test body must be approved by the competent authority and must:
- (a) have a staff with an organisational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
  - (b) have access to suitable and adequate facilities and equipment;
  - (c) operate in an impartial manner and be free from any influence which could prevent it from doing so;
  - (d) ensure commercial confidentiality;
  - (e) maintain clear demarcation between actual periodic inspection and test body functions and unrelated functions;
  - (f) operate a documented quality system in accordance with 6.2.2.6.3;
  - (g) apply for approval in accordance with 6.2.2.6.4;
  - (h) ensure that the periodic inspections and tests are performed in accordance with 6.2.2.6.5; and
  - (i) maintain an effective and appropriate report and record system in accordance with 6.2.2.6.6.

6.2.2.6.3 Quality system and audit of the periodic inspection and test body

6.2.2.6.3.1 Quality system

The quality system must contain all the elements, requirements, and provisions adopted by the periodic inspection and test body. It must be documented in a systematic and orderly manner in the form of written policies, procedures, and instructions.

*The quality system must include:*

- (a) a description of the organisational structure and responsibilities;
- (b) the relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) quality records, such as inspection reports, test data, calibration data and certificates;
- (d) management reviews to ensure the effective operation of the quality system arising from the audits performed in accordance with 6.2.2.6.3.2;
- (e) a process for control of documents and their revision;
- (f) a means for control of non-conforming pressure receptacles; and
- (g) training programmes and qualification procedures for relevant personnel.

6.2.2.6.3.2 Audit

The periodic inspection and test body and its quality system must be audited in order to determine whether it meets the requirements of this Code to the satisfaction of the competent authority.

An audit must be conducted as part of the initial approval process (see 6.2.2.6.4.3). An audit may be required as part of the process to modify an approval (see 6.2.2.6.4.6).

Periodic audits must be conducted, to the satisfaction of the competent authority, to ensure that the periodic inspection and test body continues to meet the requirements of this Code.

The periodic inspection and test body must be notified of the results of any audit. The notification must contain the conclusions of the audit and any corrective actions required.

#### 6.2.2.6.3.3

##### Maintenance of the quality system

The periodic inspection and test body must maintain the quality system as approved in order that it remains adequate and efficient.

The periodic inspection and test body must notify the competent authority that approved the quality system, of any intended changes, in accordance with the process for modification of an approval in 6.2.2.6.4.6.

#### 6.2.2.6.4

##### Approval process for periodic inspection and test bodies

##### Initial approval

#### 6.2.2.6.4.1

A body desiring to perform periodic inspection and test of pressure receptacles in accordance with a pressure receptacle standard and this Code must apply for, obtain, and retain an approval certificate issued by the competent authority.

This written approval must, on request, be submitted to the competent authority of a country of use.

#### 6.2.2.6.4.2

An application must be made for each periodic inspection and test body and must include:

- (a) the name and address of the periodic inspection and test body and, if the application is submitted by an authorised representative, its name and address;
- (b) the address of each facility performing periodic inspection and test;
- (c) the name and title of the person(s) responsible for the quality system;
- (d) the designation of the pressure receptacles, the periodic inspection and test methods, and the relevant pressure receptacle standards met by the quality system;
- (e) documentation on each facility, the equipment, and the quality system as specified under 6.2.2.6.3.1;
- (f) the qualifications and training records of the periodic inspection and test personnel; and
- (g) details of any refusal of approval of a similar application by any other competent authority.

#### 6.2.2.6.4.3

The competent authority must:

- (a) examine the documentation to verify that the procedures are in accordance with the requirements of the relevant pressure

- receptacle standards and this Code; and
- (b) conduct an audit in accordance with 6.2.2.6.3.2 to verify that the inspections and tests are carried out as required by the relevant pressure receptacle standards and this Code, to the satisfaction of the competent authority.

- 6.2.2.6.4.4 After the audit has been carried out with satisfactory results and all applicable requirements of 6.2.2.6.4 have been satisfied, an approval certificate must be issued. It must include the name of the periodic inspection and test body, the registered mark, the address of each facility, and the necessary data for identification of its approved activities (e.g. designation of pressure receptacles, periodic inspection and test method and pressure receptacle standards).
- 6.2.2.6.4.5 If the periodic inspection and test body is denied approval, the competent authority must provide written detailed reasons for such denial.
- Modifications to periodic inspection and test body approvals
- 6.2.2.6.4.6 Following approval, the periodic inspection and test body must notify the issuing competent authority of any modifications to the information submitted under 6.2.2.6.4.2 relating to the initial approval.
- The modifications must be evaluated in order to determine whether the requirements of the relevant pressure receptacle standards and this Code will be satisfied. An audit in accordance with 6.2.2.6.3.2 may be required. The competent authority must accept or reject these modifications in writing, and an amended approval certificate must be issued as necessary.
- 6.2.2.6.4.7 Upon request, the competent authority must communicate to any other competent authority, information concerning initial approvals, modifications of approvals, and withdrawn approvals.
- 6.2.2.6.5 Periodic inspection and test and certification
- The application of the periodic inspection and test marks to a pressure receptacle must be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of this Code. The periodic inspection and test body must affix the periodic inspection and test marks, including its registered mark, to each approved pressure receptacle (see 6.2.2.7.7).
- A record certifying that a pressure receptacle has passed the periodic inspection and test must be issued by the periodic inspection and test body, before the pressure receptacle is filled.
- 6.2.2.6.6 Records
- The periodic inspection and test body must retain records of pressure receptacle periodic inspection and tests (both passed and failed) including the location of the test facility, for not less than 15 years.
- The owner of the pressure receptacle must retain an identical record until the next periodic inspection and test unless the pressure receptacle is permanently removed from service.

## 6.2.2.7

### Marking of refillable UN pressure receptacles

**NOTE:** Marking requirements for UN metal hydride storage systems are given in 6.2.2.9, marking requirements for UN bundles of cylinders are given in 6.2.2.10 and marking requirements for closures are given in 6.2.2.11.

#### 6.2.2.7.1

Refillable UN pressure receptacle shells and closed cryogenic receptacles must be marked clearly and legibly with certification, operational and manufacturing marks. These marks must be permanently affixed (e.g. stamped, engraved, or etched). The marks must be on the shoulder, top end or neck of the pressure receptacle shell or on a permanently affixed component of the pressure receptacle (e.g. welded collar or corrosion resistant plate welded on the outer jacket of a closed cryogenic receptacle). Except for the UN packaging symbol, the minimum size of the marks must be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol must be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm.

#### 6.2.2.7.2

The following certification marks must be applied:

- (a) The UN packaging symbol.

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;

- (b) The technical standard (e.g. ISO 9809-1) used for design, manufacture and testing;

**NOTE:** For acetylene cylinders the standard ISO 3807 must also be marked.

- (c) The character(s) identifying the country of approval as indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>;

**NOTE:** For the purpose of this mark the country of approval means the country of the competent authority that authorized the initial inspection and test of the individual receptacle at the time of manufacture.

- (d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorising the marking;

- (e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. “/”).

**NOTE:** When an acetylene cylinders is conformity assessed in accordance with 6.2.1.4.4 (b) and the inspection bodies for the cylinder shell

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

*and the acetylene cylinder are different, their respective marks (d) are required. Only the initial inspection date (e) of the completed acetylene cylinder is required. If the country of approval of the inspection body responsible for the initial inspection and test is different a second mark (c) must be applied.*

#### 6.2.2.7.3

The following operational marks must be applied:

- (f) The test pressure in bar, preceded by the letters “PH” and followed by the letters “BAR”;
- (g) The mass of the empty pressure receptacle including all permanently attached integral parts (e.g. neck ring, foot ring, etc.) in kilograms, followed by the letters “KG”. This mass must not include the mass of closure(s), valve protection cap or valve guard, any coating, or porous material for acetylene. The mass must be expressed to three significant figures rounded up to the last digit. For cylinders of less than 1 kg, the mass must be expressed to two significant figures rounded up to the last digit. In the case of pressure receptacles for UN 1001 acetylene, dissolved and UN 3374 acetylene, solvent free, at least one decimal must be shown after the decimal point and two digits for pressure receptacles of less than 1 kg;
- (h) The minimum guaranteed wall thickness of the pressure receptacle in millimetres followed by the letters “MM”. This mark is not required for pressure receptacles with a water capacity less than or equal to 1 litre or for composite cylinders or for closed cryogenic receptacles;
- (i) In the case of pressure receptacles for compressed gases, UN 1001 acetylene, dissolved, and UN 3374 acetylene, solvent free, the working pressure in bar, preceded by the letters “PW”. In the case of closed cryogenic receptacles, the maximum allowable working pressure preceded by the letters “MAWP”;

**NOTE:** *When a cylinder shell is intended for use as an acetylene cylinder (including the porous material), the working pressure mark is not required until the acetylene cylinder is completed..*

- (j) In the case of pressure receptacles for liquefied gases, refrigerated liquefied gases and dissolved gases, the water capacity in litres expressed to three significant digits rounded down to the last digit, followed by the letter “L”. If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected;
- (k) In the case of pressure receptacles for UN 1001 acetylene, dissolved:
  - (i) the tare in kilograms consisting of the total of the mass of the empty cylinder shell, the service equipment (including porous material) not removed during filling, any coating, the solvent and the saturation gas expressed to three significant figures rounded down to the last digit followed by the letters “KG”. At least one decimal must be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass must be expressed to two significant figures rounded down to the last digit;

- (ii) the identity of the porous material (e.g.: Name and trade-mark); and
  - (iii) the total mass of the filled acetylene cylinder in kilograms followed by the letters "KG".
- (l) In the case of pressure receptacles for UN 3374 acetylene, solvent free:
- (i) the tare in kg consisting of the total of the mass of the empty cylinder shell, service equipment (including porous material) not removed during filling and any coating expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal must be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass must be expressed to two significant figures rounded down to the last digit;
  - (ii) the identity of the porous material (e.g.: name or trademark); and
  - (iii) the total mass of the filled acetylene cylinder in kilograms followed by the letters "KG";

**NOTE:** *Acetylene cylinders constructed in accordance with the twenty-first revised edition of the Model Regulations which are not marked in accordance with 6.2.2.7.3 (k) or (l) applicable in the twenty-second revised edition of the Model Regulations, may continue to be used until the next periodic inspection and test two years after the coming into force of the twenty-third revised edition of the Model Regulation where they have to be marked according to the twenty-third revised edition of the Model Regulations or be taken out of operation.*

#### 6.2.2.7.4

The following manufacturing marks must be applied:

- (m) Identification of the cylinder thread (e.g. 25E). This mark is not required for closed cryogenic receptacles;

**NOTE:** *Information on marks that may be used for identifying threads for cylinders is given in ISO/TR 11364, Gas cylinders – Compilation of national and international valve stem/gas cylinder neck threads and their identification and marking system.*

- (n) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark must be preceded by the character(s) identifying the country of manufacture indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>. The country mark and the manufacturer's mark must be separated by a space or slash;

**NOTE:** *For acetylene cylinders, if the manufacturer of the acetylene cylinder and the manufacturer of the cylinder shell are different, only the mark of the manufacturer of the completed acetylene cylinder is*

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

required.

- (o) The serial number assigned by the manufacturer;
- (p) In the case of steel pressure receptacles and composite pressure receptacles with steel liner intended for the transport of gases with a risk of hydrogen embrittlement, the letter “H” showing compatibility of the steel (see 1SO 11114-1: 2020);
- (q) For composite cylinders and tubes having a limited design life, the letters “FINAL” followed by the design life shown as the year (four digits) followed by the month (two digits) separated by a slash (i.e. “/”).
- (r) For composite cylinders and tubes having a limited design life greater than 15 years and for composite cylinders and tubes having non-limited design life, the letters “SERVICE” followed by the date 15 years from the date of manufacture (initial inspection) shown as the year (four digits) followed by the month (two digits) separated by a slash (i.e. “/”).

**NOTE:** Once the initial design type has passed the service life test programme requirements in accordance with 6.2.2.1.1 NOTE 2 or 6.2.2.1.2 NOTE 2, future production no longer requires this initial service life mark. The initial service life mark shall be made unreadable on cylinders and tubes of a design type that has met the service life test programme requirements.

#### 6.2.2.7.5

The above marks must be placed in three groups:

- Manufacturing marks must be the top grouping and must appear consecutively in the sequence given in 6.2.2.7.4 except for the marks described in 6.2.2.7.4 (q) and (r) which shall be adjacent to the periodic inspection and test marks of 6.2.2.7.7.
- The operational marks in 6.2.2.7.3 must be the middle grouping and the test pressure (f) must be immediately preceded by the working pressure (i) when the latter is required.
- Certification marks must be the bottom grouping and must appear in the sequence given in 6.2.2.7.2.

The following is an example of a marking a on a cylinder.

- 6.2.2.7.6 Other marks are allowed in areas other than the side wall, provided they are made in low stress areas and are not of a size and depth that will create harmful stress concentrations. In the case of closed cryogenic receptacles, such marks may be on a separate plate attached to the outer jacket. Such marks must not conflict with required marks.
- 6.2.2.7.7 In addition to the preceding marks, each refillable pressure receptacle that meets the periodic inspection and test requirements of 6.2.2.4 must be marked indicating:
- (a) The character(s) identifying the country authorising the body performing the periodic inspection and test as indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>. This marks is not required if this body is approved by the competent authority of the country approving manufacture;
  - (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;
  - (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. “/” ). Four digits may be used to indicate the year.
- The above marks must appear consecutively in the sequence given.
- 6.2.2.7.8 The marks in accordance with 6.2.2.7.7 may be engraved on a metallic ring affixed to the cylinder or pressure drum when the valve is installed, and which is removable only by disconnecting the valve from the cylinder or pressure drum.
- 6.2.2.7.9 UN Deleted

## **6.2.2.8 Marking of non-refillable UN cylinders**

- 6.2.2.8.1 Non-refillable UN cylinders must be marked clearly and legibly with certification and gas or pressure receptacle specific marks. These marks must be permanently affixed (e.g. stencilled, stamped, engraved, or etched) on the cylinder. Except when stencilled, the marks must be on the shoulder, top end or neck of the cylinder shell or on a permanently affixed component of the cylinder (e.g. welded collar). Except for the “UN” symbol and the “DO NOT REFILL” mark, the minimum size of the marks must be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm.
- The minimum size of the “UN” symbol must be 10 mm for cylinders with a diameter greater than or equal to 140 mm and 5 mm for cylinders with a diameter less than 140 mm. The minimum size of the “DO NOT REFILL” mark must be 5 mm.

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

6.2.2.8.2 The marks listed in 6.2.2.7.2 to 6.2.2.7.4 must be applied with the exception of (g), (h), and (m). The serial number (o) may be replaced by the batch number. In addition, the words "DO NOT REFILL" in letters of at least 5 mm in height are required.

6.2.2.8.3 The requirements of 6.2.2.7.5 must apply.

**NOTE:** *Non-refillable cylinders may, on account of their size, substitute a label for these permanent marks.*

6.2.2.8.4 Other marks are allowed provided they are made in low stress areas other than the side wall and are not of a size and depth that will create harmful stress concentrations. Such marks must not conflict with required marks.

## 6.2.2.9 Marking of UN metal hydride storage systems

6.2.2.9.1 UN metal hydride storage systems must be marked clearly and legibly with the marks listed below. These marks must be permanently affixed (e.g. stamped, engraved, or etched) on the metal hydride storage system. The marks must be on the shoulder, top end or neck of the metal hydride storage system or on a permanently affixed component of the metal hydride storage system. Except for the United Nations packaging symbol, the minimum size of the marks must be 5 mm for metal hydride storage systems with a smallest overall dimension greater than or equal to 140 mm and 2.5 mm for metal hydride storage systems with a smallest overall dimension less than 140 mm. The minimum size of the United Nations packaging symbol must be 10 mm for metal hydride storage systems with a smallest overall dimension greater than or equal to 140 mm and 5 mm for metal hydride storage systems with a smallest overall dimension less than 140 mm.

6.2.2.9.2 The following marks must be applied:

(a) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;

(b) "ISO 16111" (the technical standard used for design, manufacture and testing);

(c) The character(s) identifying the country of approval as indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>;

**NOTE:** *For the purpose of this mark the country of approval means the country of the competent authority that authorized the initial inspection and test of the individual system at the time of manufacture.*

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

- (d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorising the marking;
- (e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/");
- (f) The test pressure of the receptacle in bar, preceded by the letters "PH" and followed by the letters "BAR";
- (g) The rated charging pressure of the metal hydride storage system in bar, preceded by the letters "RCP" and followed by the letters "BAR";
- (h) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark must be preceded by the character(s) identifying the country of manufacture as indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>. The country mark and the manufacturer's mark must be separated by a space or slash;
- (i) The serial number assigned by the manufacturer;
- (j) In the case of steel receptacles and composite receptacles with steel liner, the letter "H" showing compatibility of the steel (see ISO 11114-1: 2020); and,
- (k) In the case of metal hydride storage systems having limited life, the date of expiry, denoted by the letters "FINAL" followed by the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/").

The certification marks specified in (a) to (e) above must appear consecutively in the sequence given. The test pressure (f) must be immediately preceded by the rated charging pressure (g). The manufacturing marks specified in (h) to (k) above must appear consecutively in the sequence given.

#### 6.2.2.9.3

Other marks are allowed in areas other than the side wall, provided they are made in low stress areas and are not of a size and depth that will create harmful stress concentrations. Such marks must not conflict with required marks.

#### 6.2.2.9.4

In addition to the preceding marks, each metal hydride storage system that meets the periodic inspection and test requirements of 6.2.2.4 must be marked indicating:

- (a) The character(s) identifying the country authorising the body performing the periodic inspection and test, as indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>. This mark is not required if this body is approved by the competent authority of the country approving manufacture;
- (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

- (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. "/"). Four digits may be used to indicate the year.

The above marks must appear consecutively in the sequence given.

#### **6.2.2.10**

#### **Marking of bundles of cylinders**

##### **6.2.2.10.1**

Individual cylinder shells in a bundle of cylinders must be marked in accordance with 6.2.2.7. Individual closures in a bundle of cylinders must be marked in accordance with 6.2.2.11.

##### **6.2.2.10.2**

Refillable UN bundles of cylinders must be marked clearly and legibly with certification, operational, and manufacturing marks. These marks must be permanently affixed (e.g. stamped, engraved, or etched) on a plate permanently attached to the frame of the bundle of cylinders. Except for the UN packaging symbol, the minimum size of the marks must be 5 mm. The minimum size of the UN packaging symbol must be 10 mm.

##### **6.2.2.10.3**

The following marks must be applied:

- (a) The certification marks specified in 6.2.2.7.2 (a), (b), (c), (d) and (e);
- (b) The operational marks specified in 6.2.2.7.3 (f), (i), (j) and the total of the mass of the frame of the bundle and all permanently attached parts (cylinder shells and service equipment). Bundles intended for the carriage of UN 1001 acetylene, dissolved and UN 3374 acetylene, solvent free must bear the tare as specified in clause B.4.2 of ISO 10961:2010; and
- (c) The operational marks specified in 6.2.2.7.3 (f), (i), (j) and the total of the mass of the frame of the bundle and all permanently attached parts (cylinder shells and service equipment). Bundles intended for the carriage of UN 1001 acetylene, dissolved and UN 3374 acetylene, solvent free must bear the tare as specified in clause B.4.2 of ISO 10961:2010; and
- (d) The manufacturing marks specified in 6.2.2.7.4 (n), (o) and, where applicable, (p).

##### **6.2.2.10.4**

The marks must be placed in three groups:

- (a) The manufacturing marks must be the top grouping and must appear consecutively in the sequence given in 6.2.2.10.3 (c);
- (b) The operational marks in 6.2.2.10.3 (b) must be the middle grouping and the operational mark specified in 6.2.2.7.3 (f) must be immediately preceded by the operational mark specified in 6.2.2.7.3 (i) when the latter is required;
- (c) Certification marks must be the bottom grouping and must appear in the sequence given in 6.2.2.10.3 (a).

#### **6.2.2.11**

#### **Marking of closures for refillable UN pressure receptacles**

##### **6.2.2.11.1**

For closures the following permanent marks shall be applied clearly and legibly, (e.g. stamped, engraved or etched):

- (a) Manufacturer's identification mark;
- (b) Design standard or design standard designation;

- (c) Date of manufacture (year and month or year and week) and
- (d) The identity mark of the inspection body responsible for the initial inspection

The valve test pressure shall be marked when it is less than the test pressure which is indicated by the rating of the valve filling connection.

**NOTE:** *Closures of refillable pressure receptacles manufactured before 1 January 2027 in accordance with the requirements applicable in the twenty-first revised edition of the Model Regulations which are not marked in accordance with the requirements of 6.2.2.11 applicable in the twenty second revised may continue to be used.*

## 6.2.3

### REQUIREMENTS FOR NON-UN PRESSURE RECEPTACLES

#### 6.2.3.1

Pressure receptacles not designed, constructed, inspected, tested and approved according to the requirements of Section 6.2.2, that are cylinders to be filled and used in Australia, must comply with AS 2030 and its relevant subordinate standards, and with the general requirements of Section 6.2.1.

#### 6.2.3.2

Pressure receptacles that do not comply with Section 6.2.2 must not be marked with the UN packaging symbol.

#### 6.2.3.3

Except for cylinders that comply with AS 2030 and its subordinate standards, for metallic cylinders, tubes, pressure drums, bundles of cylinders and salvage pressure receptacles, the construction must be such that the minimum burst ratio (burst pressure divided by test pressure) is:

1.50 for refillable pressure receptacles,

2.00 for non-refillable pressure receptacles.

#### 6.2.3.4

Cylinders that comply with AS 2030 and its subordinate standards must be marked in accordance with AS 2030.

#### 6.2.3.5

### Salvage pressure receptacles

To permit the safe handling and disposal of the pressure receptacles transported within the salvage pressure receptacle, the design may include equipment not otherwise used for cylinders or pressure drums such as flat heads, quick opening devices and openings in the cylindrical part.

Instructions on the safe handling and use of the salvage pressure receptacle must be clearly shown in the documentation for the application to the competent authority and must form part of the approval certificate. In the approval certificate, the pressure receptacles authorised to be transported in a salvage pressure receptacle must be indicated. A list of the materials of construction of all parts likely to be in contact with the dangerous goods must also be included.

A copy of the approval certificate must be delivered by the manufacturer to the owner of a salvage pressure receptacle.

The marking of salvage pressure receptacles according to 6.2.3 must be determined by the competent authority taking into account suitable mark-

ing provisions of 6.2.2.7 as appropriate. The marking must include the water capacity and test pressure of the salvage pressure receptacle.

**NOTE:** *These provisions for salvage pressure receptacles may be applied for new salvage pressure receptacles as from 1 January 2013, unless otherwise authorized, and shall be applied for all new salvage pressure receptacles as from 1 January 2014. Salvage pressure receptacles approved in accordance with national regulations may be used with the approval of the competent authorities of the countries of use.*

## **6.2.4 REQUIREMENTS FOR AEROSOL DISPENSERS, SMALL RECEPTACLES CONTAINING GAS (GAS CARTRIDGES) AND FUEL CELL CARTRIDGES CONTAINING LIQUEFIED FLAMMABLE GAS**

### **6.2.4.0 Aerosol Dispensers**

6.2.4.0.1 Metal aerosol dispensers must comply with AS 2278 or an equivalent international or foreign standard (see 1.2.3.2.4).

6.2.4.0.2 Plastic aerosol dispensers can be used for aerosol formulations classified as Division 2.2 not exceeding 1000 ml capacity. The plastic aerosol dispensers must comply with British Standard BS 5597:1991 – “Specification for non-refillable plastics aerosol dispensers up to 1000 ml capacity”.

6.2.4.1 The internal pressure of aerosol dispensers at 50 °C must not exceed 1.2 MPa (12 bar) when using flammable liquefied gases, 1.32 MPa (13.2 bar) when using non-flammable liquified gases, and 1.5 MPa (15 bar) when using non-flammable compressed or dissolved gases. In case of a mixture of several gases, the stricter limit must be applied.

6.2.4.2 Each filled aerosol dispenser or gas cartridge or fuel cell cartridge must be subjected to a test in a hot water bath in accordance with 6.2.4.2.1 or an approved water bath alternative in accordance with 6.2.4.2.2.

6.2.4.2.1 Hot water bath test

6.2.4.2.1.1 The temperature of the water bath and the duration of the test must be such that the internal pressure reaches that which would be reached at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the aerosol dispenser, gas cartridge or the fuel cell cartridge at 50 °C). If the contents are sensitive to heat or if the aerosol dispensers, gas cartridge or the fuel cell cartridge are made of plastics material which softens at this test temperature, the temperature of the bath must be set at between 20 °C and 30 °C but, in addition, one aerosol dispenser, gas cartridge or the fuel cell cartridge in 2000 must be tested at the higher temperature.

6.2.4.2.1.2 No leakage or permanent deformation of an aerosol dispenser, gas cartridge or the fuel cell cartridge may occur, except that a plastic aerosol dispenser, gas cartridge or the fuel cell cartridge may be deformed through softening provided that it does not leak.

6.2.4.2.2 Alternative methods

Alternative methods which provide an equivalent level of leak detection may be used provided that the requirements of 6.2.4.2.1 and, as appropriate, 6.2.4.2.2.2 or 6.2.4.2.2.3 are met.

#### 6.2.4.2.2.1

##### Quality system

Aerosol dispenser, gas cartridge or the fuel cell cartridge fillers and component manufacturers must have a quality system. The quality system must implement procedures to ensure that all aerosol dispensers, gas cartridge or the fuel cell cartridges that leak or that are deformed are rejected and not offered for transport.

The quality system must include:

- (a) a description of the organisational structure and responsibilities;
- (b) the relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) quality records, such as inspection reports, test data, calibration data and certificates;
- (d) management reviews to ensure the effective operation of the quality system;
- (e) a process for control of documents and their revision;
- (f) a means for control of non-conforming aerosol dispensers, gas cartridge or the fuel cell cartridges;
- (g) training programmes and qualification procedures for relevant personnel; and
- (h) procedures to ensure that there is no damage to the final product.

An initial audit and periodic audits must be conducted in accordance with AS 2278 for metal aerosol dispensers or BA 5597:1991 for plastic aerosol dispensers. These audits must ensure the system is and remains adequate and efficient.

#### 6.2.4.2.2.2

##### Aerosol Dispensers

##### 6.2.4.2.2.2.1

##### Pressure and leak testing of aerosol dispensers before filling

Each empty aerosol dispenser must be subjected to a pressure equal to or in excess of the maximum expected in the filled aerosol dispensers at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the receptacle at 50 °C). This must be at least two-thirds of the design pressure of the aerosol dispenser. If any aerosol dispenser shows evidence of leakage at a rate equal to or greater than  $3.3 \times 10^{-2}$  mbar.l.s<sup>-1</sup> at the test pressure, distortion or other defect, it must be rejected.

##### 6.2.4.2.2.2.2

##### Testing of the aerosol dispensers after filling

Prior to filling the filler must ensure that the crimping equipment is set appropriately and the specified propellant is used.

Each filled aerosol dispenser must be weighed and leak tested. The leak detection equipment must be sufficiently sensitive to detect at least a leak rate of  $2.0 \times 10^{-3}$  mbar.l.s<sup>-1</sup> at 20 °C.

Any filled aerosol dispenser which shows evidence of leakage, deformation or excessive mass must be rejected.

#### 6.2.4.2.2.3

##### Gas cartridges and fuel cell cartridges

##### 6.2.4.2.2.3.1

##### Pressure testing of gas cartridges and fuel cell cartridges

Each gas cartridge or fuel cell cartridge must be subjected to a test pressure equal to or in excess of the maximum expected in the filled receptacle at 55°C (50°C if the liquid phase does not exceed 95% of the capacity of the receptacle at 50°C). This test pressure must be that specified for the gas cartridge or fuel cell cartridge and must not be less than two thirds the design pressure of the gas cartridge or fuel cell cartridge. If any gas cartridge or fuel cell cartridge shows evidence of leakage at a rate equal to or greater than  $3.3 \times 10^{-2}$  mbar.l.s<sup>-1</sup> at the test pressure or distortion or any other defect, it must be rejected.

#### 6.2.4.2.2.3.2

##### Leak testing gas cartridges and fuel cell cartridges

Prior to filling and sealing, the filler must ensure that the closures (if any), and the associated sealing equipment are closed appropriately and the specified gas is used.

Each filled gas cartridge or fuel cell cartridge must be checked for the correct mass of gas and must be leak tested. The leak detection equipment must be sufficiently sensitive to detect at least a leak rate of  $2.0 \times 10^{-3}$  mbar.l.s<sup>-1</sup> at 20°C.

Any gas cartridge or fuel cell cartridge that has gas masses not in conformity with the declared mass limits or shows evidence of leakage or deformation, must be rejected.

#### 6.2.4.2.3

With the approval of the competent authority, aerosols and receptacles, small, are not subject to 6.2.4.2.1 and 6.2.4.2.2, if they are required to be sterile but may be adversely affected by water bath testing, provided:

- (a) They contain a non-flammable gas and either
  - (i) contain other substances that are constituent parts of pharmaceutical products for medical, veterinary or similar purposes;
  - (ii) contain other substances used in the production process for pharmaceutical products; or
  - (iii) are used in medical, veterinary or similar applications;
- (b) An equivalent level of safety is achieved by the manufacturer's use of alternative methods for leak detection and pressure resistance, such as helium detection and water bathing a statistical sample of at least 1 in 2000 from each production batch; and
- (c) For pharmaceutical products according to (a) (i) and (iii) above, they are manufactured under the authority of a national health administration. If required by the competent authority, the principles of Good Manufacturing Practice (GMP) established by the World Health Organisation (WHO)<sup>1</sup> must be followed.

<sup>1</sup>WHO Publication: "Quality assurance of pharmaceuticals. A compendium of guidelines and related materials. Volume 2: Good manufacturing practices and inspection".

## CHAPTER 6.3: REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PACKAGINGS FOR DIVISION 6.2 INFECTIOUS SUBSTANCES OF CATEGORY A (UN 2814 AND UN 2900)

**NOTE:** For land transport in Australia only, this Chapter does not apply to packagings for medical or clinical waste that is correctly assigned to UN 3291 in accordance with 2.6.3.5 and is packed in accordance with Packing Instruction P62A.

### 6.3.1 GENERAL

6.3.1.1 The requirements of this Chapter apply to packagings intended for the transport of infectious substances of Category A, UN 2814 and UN 2900.

### 6.3.2 REQUIREMENTS FOR PACKAGINGS

6.3.2.1 The requirements for packagings in this section are based on packagings, as specified in 6.1.4, currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in this chapter provided that they are equally effective, and able to successfully fulfil the requirements described in 6.3.5. Methods of testing other than those described in this Code are acceptable provided they are equivalent.

6.3.2.2 Packagings must be manufactured and tested under a quality assurance programme in order to ensure that each packaging meets the requirements of this chapter.

**NOTE:** ISO 16106:2020 “Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001” provides acceptable guidance on procedures which may be followed.

6.3.2.3 Manufacturers and subsequent distributors of packagings must provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for transport are capable of passing the applicable performance tests of this chapter.

### 6.3.3 CODE FOR DESIGNATING TYPES OF PACKAGINGS

6.3.3.1 The codes for designating types of packagings are set out in 6.1.2.7.

6.3.3.2 The letters “U” or “W” may follow the packaging code. The letter “U” signifies a special packaging conforming to the requirements of 6.3.5.1.6. The letter “W” signifies that the packaging, although, of the same type indicated by the code is manufactured to a specification different from that in 6.1.4 and is considered equivalent under the requirements of 6.3.2.1.

### 6.3.4 MARKING

**NOTE 1:** The marks indicate that the packaging which bears them corresponds to a successfully tested design type and that it complies with

*the requirements of this chapter which are related to the manufacture, but not to the use, of the packaging.*

**NOTE 2:** *The marks are intended to be of assistance to packaging manufacturers, reconditioners, packaging users, carriers and regulatory authorities.*

**NOTE 3:** *The marks do not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings.*

6.3.4.1

Each packaging intended for use according to this Code must bear marks which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the marks or a duplicate thereof must appear on the top or on a side of the packaging. Letters, numerals and symbols must be at least 12 mm high, except for packagings of 30 litres capacity or less or of 30 kg maximum net mass, when they must be at least 6 mm in height and for packagings of 5 litres capacity or less or of 5 kg maximum net mass when they must be of an appropriate size.

6.3.4.2

A packaging that meets the requirements of this section and of 6.3.5 must be marked with:

- (a) The United Nations packaging symbol  
This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;
- (b) The code designating the type of packaging according to the requirements of 6.1.2;
- (c) The text "CLASS 6.2";
- (d) The last two digits of the year of manufacture of the packaging;
- (e) The state authorising the allocation of the mark, indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>;
- (f) The name of the manufacturer or other identification of the packaging specified by the competent authority;
- (g) For packagings meeting the requirements of 6.3.5.1.6, the letter "U", inserted immediately following the mark required in (b) above.

6.3.4.3

Marks must be applied in the sequence shown in 6.3.4.2 (a) to (g); each mark required in these sub-paragraphs must be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For example, see 6.3.4.4.

Any additional marks authorised by a competent authority must still enable the marks required in 6.3.4.1 to be correctly identified.

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

#### 6.3.4.4

Example of Marking:

4G/CLASS 6.2/06

as in 6.3.4.2(a), (b), (c) and (d)

S/SP-9989-ERIKSSON

as in 6.3.4.2(e) and (f)

### 6.3.5

## TEST REQUIREMENTS FOR PACKAGINGS

#### 6.3.5.1

### Performance and frequency of tests

##### 6.3.5.1.1

The design type of each packaging must be tested as provided in this section in accordance with procedures established by the competent authority.

##### 6.3.5.1.2

Each packaging design type must successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.

##### 6.3.5.1.3

Tests must be repeated on production samples at intervals established by the competent authority.

##### 6.3.5.1.4

Tests must also be repeated after each modification which alters the design, material or manner of construction of a packaging.

##### 6.3.5.1.5

The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes or lower net mass of primary receptacles; and packagings such as drums and boxes which are produced with small reductions in external dimension(s).

##### 6.3.5.1.6

Primary receptacles of any type may be assembled within a secondary packaging and transported without testing in the rigid outer packaging under the following conditions:

- (a) The rigid outer packaging must have been successfully tested in accordance with 6.3.5.2.2 with fragile (e.g., glass) primary receptacles;
- (b) The total combined gross mass of primary receptacles must not exceed one half the gross mass of primary receptacles used for the drop test in (a) above;
- (c) The thickness of cushioning between primary receptacles and between primary receptacles and the outside of the secondary packaging must not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single primary receptacle was used in the original test, the thickness of cushioning between primary receptacles must not be less than the thickness of cushioning between the outside of the secondary packaging and the primary receptacle in the original test. When either fewer or smaller primary receptacles are used (as compared to the primary receptacles used in the drop test), sufficient additional cushioning material must be used to take up the void spaces;

- (d) The rigid outer packaging must have successfully passed the stacking test in 6.1.5.6 while empty. The total mass of identical packages must be based on the combined mass of packagings used in the drop test in (a) above;
- (e) For primary receptacles containing liquids, an adequate quantity of absorbent material to absorb the entire liquid content of the primary receptacles must be present;
- (f) If the rigid outer packaging is intended to contain primary receptacles for liquids and is not leakproof, or is intended to contain primary receptacles for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage must be provided in the form of a leakproof liner, plastics bag or other equally effective means of containment;
- (g) In addition to the marks prescribed in 6.3.4.2(a) to (f), packagings must be marked in accordance with 6.3.4.2(g).

- 6.3.5.1.7

The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests.
- 6.3.5.1.8

Provided the validity of the test results is not affected, several tests may be made on one sample.

6.3.5.2

Preparation of packagings for testing

- 6.3.5.2.1

Samples of each packaging must be prepared as for transport except that a liquid or solid infectious substance must be replaced by water or, where conditioning at -18 °C is specified, by water/antifreeze. Each primary receptacle must be filled to not less than 98% of its capacity.

**NOTE:** The term water includes water/antifreeze solution with a minimum specific gravity of 0.95 for testing at -18 °C.
- 6.3.5.2.2

Tests and number of samples required

Table 6.3.5.2.2: Tests and Samples Required for Packaging Types

| Type of packaging <sup>a</sup> |                    |            | Tests required              |                                   |                  |                                         |                          |                  |
|--------------------------------|--------------------|------------|-----------------------------|-----------------------------------|------------------|-----------------------------------------|--------------------------|------------------|

|                                                                                                                                      |  |  |  |  |  |  |  |  |
|--------------------------------------------------------------------------------------------------------------------------------------|--|--|--|--|--|--|--|--|
| Table note:                                                                                                                          |  |  |  |  |  |  |  |  |
| a. “Type of packaging” categorises packagings for test purposes according to the kind of packaging and its material characteristics. |  |  |  |  |  |  |  |  |

**NOTE 1:** In instances where a primary receptacle is made of two or more materials, the material most liable to damage determines the appropriate test.

**NOTE 2:** The material of the secondary packagings are not taken into consideration when selecting the test or conditioning for the test.

#### Explanation for use of the table:

If the packaging to be tested consists of a fibreboard outer box with a plastics primary receptacle, five samples must undergo the water spray test (see 6.3.5.3.5.1) prior to dropping and another five must be conditioned to – 18 °C (see 6.3.5.3.5.2) prior to dropping. If the packaging is to contain dry ice then one further single sample must be dropped in accordance with 6.3.5.3.5.3.

Packagings prepared as for transport must be subjected to the tests in 6.3.5.3 and 6.3.5.4. For outer packagings, the headings in the table relate to fibreboard or similar materials whose performance may be rapidly affected by moisture; plastics which may embrittle at low temperature; and other materials such as metal whose performance is not affected by moisture or temperature.

### 6.3.5.3

#### Drop Test

##### 6.3.5.3.1

#### Drop height and target

Samples must be subjected to free-fall drops from a height of 9 m on to a non-resilient, horizontal, flat, massive and rigid surface in conformity with 6.1.5.3.4.

- 6.3.5.3.2 Number of test samples and drop orientation
- 6.3.5.3.2.1 Where the samples are in the shape of a box, five must be dropped, one in each of the following orientations:
- (a) flat on to the base;
  - (b) flat on to the top;
  - (c) flat on to the longest side;
  - (d) flat on to the shortest side;
  - (e) on to a corner.
- 6.3.5.3.2.2 Where the samples are in the shape of a drum, three must be dropped, one in each of the following orientations:
- (a) diagonally on to the top edge, with the centre of gravity directly above the point of impact;
  - (b) diagonally on to the base edge;
  - (c) flat on to the body or side.
- 6.3.5.3.3 While the sample must be released in the required orientation, it is accepted that for aerodynamic reasons the impact may not take place in that orientation.
- 6.3.5.3.4 Following the appropriate drop sequence, there must be no leakage from the primary receptacle(s) which must remain protected by cushioning/absorbent material in the secondary packaging.
- 6.3.5.3.5 Special preparation of test sample for the drop test
- 6.3.5.3.5.1 Fibreboard - Water spray test
- Fibreboard outer packagings: The sample must be subjected to a water spray that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour. It must then be subjected to the test described in 6.3.5.3.1.
- 6.3.5.3.5.2 Plastics material – Cold conditioning
- Plastics primary receptacles or outer packagings: The temperature of the test sample and its contents must be reduced to -18 °C or lower for a period of at least 24 hours and within 15 minutes of removal from that atmosphere the test sample must be subjected to the test described in 6.3.5.3.1. Where the sample contains dry ice, the conditioning period may be reduced to 4 hours.
- 6.3.5.3.5.3 Packagings intended to contain dry ice - Additional drop test
- Where the packaging is intended to contain dry ice, a test additional to that specified in 6.3.5.3.1 and, when appropriate, in 6.3.5.3.5.1 or 6.3.5.3.5.2 must be carried out. One sample must be stored so that all the dry ice dissipates and then that sample must be dropped in one of the orientations described in 6.3.5.3.2.1 or in 6.3.5.3.2.2 as appropriate; which must be that most likely to result in failure of the packaging.
- 6.3.5.4 Puncture Test**
- 6.3.5.4.1 Packagings with a gross mass of 7 kg or less
- Samples must be placed on a level hard surface. A cylindrical steel rod with a mass of at least 7 kg, a diameter of 38 mm and the impact end

edges a radius not exceeding 6 mm (see Figure 6.3.1), must be dropped in a vertical free fall from a height of 1 m, measured from the impact end to the impact surface of the sample. One sample must be placed on its base. A second sample must be placed in an orientation perpendicular to that used for the first. In each instance the steel rod must be aimed to impact the primary receptacle. Following each impact, penetration of the secondary packaging is acceptable, provided that there is no leakage from the primary receptacle(s).

#### 6.3.5.4.2

Packagings with a gross mass exceeding 7 kg

Samples must be dropped on to the end of a cylindrical steel rod. The rod must be set vertically in a level hard surface. It must have a diameter of 38 mm and the edges of its upper end must have a radius not exceeding 6 mm (see figure 6.3.1). The rod must protrude from the surface a distance at least equal to that between the centre of the primary receptacle(s) and the outer surface of the outer packaging with a minimum of 200 mm. One sample must be dropped with its top face lowermost in a vertical free fall from a height of 1 m, measured from the top of the steel rod. A second sample must be dropped from the same height in an orientation perpendicular to that used for the first. In each instance the packaging must be so orientated that the steel rod would be capable of penetrating the primary receptacle(s). Following each impact, penetration of the secondary packaging is acceptable provided that there is no leakage from the primary receptacle(s).

**Figure 6.3.1: Packagings With a Gross Mass Exceeding 7 kg**

### 6.3.5.5

#### Test report

##### 6.3.5.5.1

A written test report containing at least the following particulars must be drawn up and must be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test and of the report;
5. Manufacturer of the packaging;
6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Test contents;
9. Test descriptions and results;
10. The test report must be signed with the name and status of the signatory.

##### 6.3.5.5.2

The test report must contain statements that the packaging prepared as for transport was tested in accordance with the appropriate requirements of this chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report must be available to the competent authority.

## CHAPTER 6.4: RESERVED (CLASS 7)

**NOTE:** Refer ARPANSA website.

## CHAPTER 6.5: REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF INTERMEDIATE BULK CONTAINERS

### 6.5.1 GENERAL REQUIREMENTS

#### 6.5.1.1 Scope

6.5.1.1.1 The requirements of this chapter apply to IBCs intended for the transport of certain dangerous goods. The provisions set out general requirements for multimodal transport and do not establish special requirements that may be required for a particular mode.

6.5.1.1.2 The requirements for IBCs in 6.5.3 are based on IBCs currently in use. In order to take into account progress in science and technology, there is no objection to the use of IBCs having specifications different from those in 6.5.3 and 6.5.5, provided that they are equally effective, acceptable to the competent authority and able to successfully fulfil the requirements described in 6.5.4 and 6.5.6. Methods of inspection and testing other than those described in this Code are acceptable provided they are equivalent.

6.5.1.1.3 The construction, equipment, testing, marking and operation of IBCs must be subject to acceptance by the competent authority of the country in which the IBCs are approved.

6.5.1.1.4 Manufacturers and subsequent distributors of IBCs must provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that IBCs as presented for transport are capable of passing the applicable performance tests of this chapter.

#### 6.5.1.2 Definitions

**Body** (for all categories of IBCs other than composite IBCs) means the receptacle proper, including openings and their closures, but does not include service equipment;

**Handling device** (for flexible IBCs) means any sling, loop, eye or frame attached to the body of the IBC or formed from a continuation of the IBC body material;

**Maximum permissible gross mass** means the mass of the IBC and any service or structural equipment together with the maximum net mass;

**Plastics material**, when used in connection with inner receptacles for composite IBCs, is taken to include other polymeric materials such as rubber;

**Protected** (for metal IBCs) means being provided with additional protection against impact, the protection taking the form of, for example, a multi-layer (sandwich) or double wall construction or a frame with a metal lattice-work casing;

**Service equipment** means filling and discharge devices and, according to the category of IBC, pressure-relief or venting, safety, heating and heat-insulating devices and measuring instruments;

**Structural equipment** (for all categories of IBCs other than flexible IBCs) means the reinforcing, fastening, handling, protective or stabilising members of the body, including the base pallet for composite IBCs with plastics inner receptacle, fibreboard and wooden IBCs;

**Woven plastics** (for flexible IBCs) means a material made from stretched tapes or monofilaments of a suitable plastics material.

6.5.1.3 Categories of IBCs

- 6.5.1.3.1 **Metal IBCs** consist of a metal body together with appropriate service and structural equipment.
- 6.5.1.3.2 **Flexible IBCs** consist of a body constituted of film, woven fabric or any other flexible material or combinations thereof, and if necessary an inner coating or liner, together with any appropriate service equipment and handling devices.
- 6.5.1.3.3 **Rigid plastics IBCs** consist of a rigid plastics body, which may have structural equipment together with appropriate service equipment.
- 6.5.1.3.4 **Composite IBCs** consist of structural equipment in the form of a rigid outer casing enclosing a plastics inner receptacle together with any service or other structural equipment. They are so constructed that the inner receptacle and outer casing once assembled, form and are used as, an integrated single unit to be filled, stored, transported or emptied as such.
- 6.5.1.3.5 **Fibreboard IBCs** consist of a fibreboard body with or without separate top and bottom caps, if necessary an inner liner (but no inner packagings), appropriate service and structural equipment.
- 6.5.1.3.6 **Wooden IBCs** consist of a rigid or collapsible wooden body together with an inner liner (but no inner packagings) and appropriate service and structural equipment.

6.5.1.4 Designatory code system for IBCs

- 6.5.1.4.1 The code must consist of two Arabic numerals as specified in (a); followed by a capital letter(s) specified in (b); followed, when specified in an individual section, by an Arabic numeral indicating the category of IBC.

(a)

| Type     | For solids filled or discharged |                                              | For liquids |
|----------|---------------------------------|----------------------------------------------|-------------|
|          | by gravity                      | under pressure of more than 10 kPa (0.1 bar) |             |
| Rigid    | 11                              | 21                                           | 31          |
| Flexible | 13                              | —                                            | —           |

(b) Materials

A Steel (all types and surface treatments)

B Aluminium

C Natural wood

D Plywood

F Reconstituted wood

G Fibreboard

H Plastics material

L Textile

M Paper, multiwall

N Metal (other than steel or aluminium)

6.5.1.4.2

For composite IBCs, two capital letters in Latin characters must be used in sequence in the second position of the code. The first must indicate the material of the inner receptacle of the IBC and the second that of the outer packaging of the IBC.

6.5.1.4.3

The following types and codes of IBC are assigned:

**Table 6.5.1.4.3: Assigned IBC Codes**

| Material                         | Category                                        | Code | Paragraph |
|----------------------------------|-------------------------------------------------|------|-----------|
| Metal                            |                                                 |      | 6.5.5.1   |
| A. Steel                         | for solids, filled or discharged by gravity     | 11A  |           |
|                                  | for solids, filled or discharged under pressure | 21A  |           |
|                                  | for liquids                                     | 31A  |           |
| B. Aluminium                     | for solids, filled or discharged by gravity     | 11B  |           |
|                                  | for solids, filled or discharged under pressure | 21B  |           |
|                                  | for liquids                                     | 31B  |           |
| N. Other than steel or aluminium | for solids, filled or discharged by gravity     | 11N  |           |
|                                  | for solids, filled or discharged under pressure | 21N  |           |
|                                  | for liquids                                     | 31N  |           |

| Material                                     | Category                                                                                 | Code         | Paragraph |
|----------------------------------------------|------------------------------------------------------------------------------------------|--------------|-----------|
| Flexible                                     |                                                                                          |              | 6.5.5.2   |
| H. Plastics                                  | woven plastics without coating or liner                                                  | 13H1         |           |
|                                              | woven plastics, coated                                                                   | 13H2         |           |
|                                              | woven plastics with liner                                                                | 13H3         |           |
|                                              | woven plastics, coated and with liner                                                    | 13H4         |           |
|                                              | plastics film                                                                            | 13H5         |           |
| L. Textile                                   | without coating or liner                                                                 | 13L1         |           |
|                                              | Coated                                                                                   | 13L2         |           |

| G. Fibreboard                                                                                                                                                                                  | for solids, filled or discharged by gravity                   | 11G   | 6.5.5.5   |
| Wooden                                                                                                                                                                                         |                                                               |       | 6.5.5.6   |
| C. Natural wood                                                                                                                                                                                | for solids, filled or discharged by gravity with inner liner  | 11C   |           |
| D. Plywood                                                                                                                                                                                     | for solids, filled or discharged by gravity, with inner liner | 11D   |           |
| F. Reconstituted wood                                                                                                                                                                          | for solids, filled or discharged by gravity, with inner liner | 11F   |           |
| Table note:<br>a. The code must be completed by replacing the letter Z with a capital letter in accordance with 6.5.1.4.1(b) to indicate the nature of the material used for the outer casing. |                                                               |       |           |

6.5.1.4.4 The letter “W” may follow the IBC code. The letter “W” signifies that the IBC, although of the same type indicated by the code, is manufactured to a specification different from those in section 6.5.5 and is considered equivalent in accordance with the requirements in 6.5.1.1.2.

## 6.5.2 MARKING

### 6.5.2.1 Primary marking

6.5.2.1.1 Each IBC manufactured and intended for use according to this Code must bear marks which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols must be at least 12 mm high and must show:

(a) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8.;

For metal IBCs on which the marks are stamped or embossed, the capital letters “UN” may be applied instead of the symbol;

(b) The code designating the type of IBC according to 6.5.1.4;

(c) A capital letter designating the packing group(s) for which the design type has been approved:

(i) X for packing groups I, II and III (IBCs for solids only);

(ii) Y for packing groups II and III;

(iii) Z for packing group III only;

(d) The month and year (last two digits) of manufacture;

- (e) The State authorising the allocation of the mark; indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>;
- (f) The name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority;
- (g) The stacking test load in kg. For IBCs not designed for stacking, the figure “0” must be shown;
- (h) The maximum permissible gross mass in kg.

The primary marks required above shall be applied in the sequence of the subparagraphs above. The marks required by 6.5.2.2. and any further marks authorized by a competent authority shall still enable the primary marks to be correctly identified.

Each mark applied in accordance with (a) to (h) and with 6.5.2.2 shall be clearly separated e.g. by a slash or space, so as to be easily identifiable.

#### 6.5.2.1.2

IBCs manufactured from recycled plastics material as defined in 1.2.1 must be marked “REC”. For rigid IBCs this mark must be placed near the marks prescribed in 6.5.2.1.1. For the inner receptacle of composite IBCs, this, this mark must be placed near the marks prescribed in 6.5.2.2.4.

#### 6.5.2.1.3

Examples of markings for various types of IBC in accordance with (a) to (h) above:

|                                                                                     |                                            |                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | 11A/Y/02 99/NL/<br>Mulder 007/5500/1500    | For a metal IBC for solids discharged by gravity and made from steel/for packing groups II and III/ manufactured in February 1999/authorised by the Netherlands/manufactured by Mulder and of a design type to which the competent authority has allocated serial number 007/the stacking test load in kg/the maximum permissible gross mass in kg. |
|  | 13H3/Z/03 01/F/<br>Meunier 1713/0/1500     | For a flexible IBC for solids discharged for instance by gravity and made from woven plastics with a liner/not designed to be stacked.                                                                                                                                                                                                              |
|  | 31H1/Y/04 99/ GB/9099<br>10800/1200        | For a rigid plastics IBC for liquids made from plastics with structural equipment withstanding the stack load.                                                                                                                                                                                                                                      |
|  | 31HA1/Y/05 01/D/<br>Muller 1683/10800/1200 | For a composite IBC for liquids with a rigid plastics inner receptacle and a steel outer casing.                                                                                                                                                                                                                                                    |
|  | 11C/X/01 02/S/<br>Aurigny 9876/ 3000/910   | For a wooden IBC for solids with an inner liner and authorised for packing group I solids.                                                                                                                                                                                                                                                          |

#### 6.5.2.1.4

Where an IBC conforms to one or more than one tested IBC design type, including one or more than one tested packaging or large packaging design type, the IBC may bear more than one mark to indicate the relevant performance test requirements that have been met. Where more than one mark appears on an IBC, the marks must appear in close proximity to one another and each mark shall appear in its entirety.

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

## 6.5.2.2 Additional marking

6.5.2.2.1 Each IBC must bear the marks required in 6.5.2.1 and, in addition, the following information which may appear on a corrosion-resistant plate permanently attached in a place readily accessible for inspection:

**Table 6.5.2.2.1: Additional IBC Markings**

| Additional marks                                                              | Category of IBC |                |           |            |        |
|-------------------------------------------------------------------------------|-----------------|----------------|-----------|------------|--------|
|                                                                               | Metal           | Rigid Plastics | Composite | Fibreboard | Wooden |
| Capacity in litres <sup>a</sup> at 20 °C                                      | X               | X              | X         |            |        |
| Tare mass in kg <sup>a</sup>                                                  | X               | X              | X         | X          | X      |
| Test (gauge) pressure, in kPa or bar <sup>a</sup> , if applicable             |                 | X              | X         |            |        |
| Maximum filling/discharge pressure in kPa or bar <sup>a</sup> , if applicable | X               | X              | X         |            |        |
| Body material and its minimum thickness in mm                                 | X               |                |           |            |        |
| Date of last leakproofness test, if applicable (month and year)               | X               | X              | X         |            |        |
| Date of last inspection (month and year)                                      | X               | X              | X         |            |        |
| Serial number of the manufacturer                                             | X               |                |           |            |        |
| <b>Table Note:</b><br>a. The unit used must be indicated.                     |                 |                |           |            |        |

6.5.2.2.2 The maximum permitted stacking load applicable must be displayed on a symbol as shown in figure 6.5.1 or figure 6.5.2. The symbol must be durable and clearly visible.

**Figure 6.5.1 and 6.5.2: Marking IBCs**

The minimum dimensions must be 100 mm x 100 mm. The letters and numbers indicating the mass must be at least 12 mm high. The area within the printer's marks indicated by the dimensional arrows must be square. Where dimensions are not specified, all features must be in approximate proportion to those shown. The mass marked above the symbol must not exceed the load imposed during the design type test (see 6.5.6.6.4) divided by 1.8.

#### 6.5.2.2.3

In addition to the marks required in 6.5.2.1, flexible IBCs may bear a pictogram indicating recommended lifting methods.

#### 6.5.2.2.4

Inner receptacles that are of composite IBC design type shall be identified by the application of the marks indicated in 6.5.2.1.1 (b), (c), (d) where this date is that of the manufacture of the plastics inner receptacle, (e) and (f). The UN packaging symbol must not be applied. The marks must be applied in the sequence shown in 6.5.2.1.1. They must be durable, legible and placed in a location so as to be readily accessible for inspection after assembling the inner receptacle in the outer casing. When the marks on the inner receptacle is not readily accessible for inspection due to the design of the outer casing, a duplicate of the required mark on the inner receptacle shall be placed on the outer casing preceded by the wording "Inner receptacle". This duplicate shall be durable, legible and placed in a location so as to be readily accessible for inspection.

The date of the manufacture of the plastics inner receptacle may alternatively be marked on the inner receptacle adjacent to the remainder of the marks. In such a case, the date may be waived from the remainder of the marks. An example of an appropriate marking method is:

**NOTE 1:** Other methods that provide the minimum required information in a durable, visible and legible form are also acceptable.

**NOTE 2:** The date of manufacture of the inner receptacle may be different from the marked date of manufacture (see 6.5.2.1), repair (see 6.5.4.5.3) or remanufacture (see 6.5.2.4) of the composite IBC.

6.5.2.2.5 Where a composite IBC is designed in such a manner that the outer casing is intended to be dismantled for transport when empty (such as for return of the IBC for reuse to the original consignor), each of the parts intended to be detached when so dismantled must be marked with the month and year of manufacture and the name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority (6.5.2.1.1(f)).

6.5.2.3 Conformity to design type: The marks indicate that IBCs correspond to a successfully tested design type and that the requirements referred to in the certificate have been met.

#### 6.5.2.4 **Marking of remanufactured composite IBCs (31HZ1)**

The marks specified in 6.5.2.1.1 and 6.5.2.2 must be removed from the original IBC or made permanently illegible and new marks must be applied to an IBC remanufactured in accordance with this Code.

### 6.5.3 **CONSTRUCTION REQUIREMENTS**

#### 6.5.3.1 **General requirements**

6.5.3.1.1 IBCs must be resistant to or adequately protected from deterioration due to the external environment.

6.5.3.1.2 IBCs must be so constructed and closed that none of the contents can escape under normal conditions of transport including the effect of vibration, or by changes in temperature, humidity or pressure.

6.5.3.1.3 IBCs and their closures must be constructed of materials compatible with their contents, or be protected internally, so that they are not liable:

- (a) To be attacked by the contents so as to make their use dangerous;
- (b) To cause the contents to react or decompose, or form harmful or dangerous compounds with the IBCs.

6.5.3.1.4 Gaskets, where used, must be made of materials not subject to attack by the contents of the IBCs.

- 6.5.3.1.5 All service equipment must be so positioned or protected as to minimise the risk of escape of the contents owing to damage during handling and transport.
- 6.5.3.1.6 IBCs, their attachments and their service and structural equipment must be designed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and transport. IBCs intended for stacking must be designed for stacking. Any lifting or securing features of IBCs must be of sufficient strength to withstand the normal conditions of handling and transport without gross distortion or failure and must be so positioned that no undue stress is caused in any part of the IBC.
- 6.5.3.1.7 Where an IBC consists of a body within a framework it must be so constructed that:
- (a) The body does not chafe or rub against the framework so as to cause material damage to the body;
  - (b) The body is retained within the framework at all times;
  - (c) The items of equipment are fixed in such a way that they cannot be damaged if the connections between body and frame allow relative expansion or movement.
- 6.5.3.1.8 Where a bottom discharge valve is fitted, it must be capable of being made secure in the closed position and the whole discharge system must be suitably protected from damage. Valves having lever closures must be able to be secured against accidental opening and the open or closed position must be readily apparent. For IBCs containing liquids, a secondary means of sealing the discharge aperture must also be provided, e.g. by a blank flange or equivalent device.
- 6.5.4 TESTING, CERTIFICATION AND INSPECTION**
- 6.5.4.1 Quality assurance: the IBCs must be manufactured, remanufactured, repaired and tested under a quality assurance programme in order to ensure that each manufactured, remanufactured or repaired IBC meets the requirements of this chapter.
- NOTE:** *ISO 16106:2020 “Transport packages for dangerous goods - Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings - Guidelines for the application of ISO 9001” provides acceptable guidance on procedures which may be followed.*
- 6.5.4.2 Test requirements: IBCs must be subject to design type tests and, if applicable, to initial and periodic inspections and tests in accordance with 6.5.4.4.
- 6.5.4.3 Certification: in respect of each design type of IBC a certificate and mark (as in 6.5.2) must be issued attesting that the design type including its equipment meets the test requirements.
- 6.5.4.4 Inspection and testing**
- NOTE:** *See also 6.5.4.5 for tests and inspections on repaired IBCs.*

- 6.5.4.4.1 Every metal, rigid plastics and composite IBCs must be inspected to the satisfaction of the competent authority:
- (a) Before it is put into service (including after remanufacture), and thereafter at intervals not exceeding five years, with regard to:
    - (i) conformity to design type including marks;
    - (ii) internal and external condition;
    - (iii) proper functioning of service equipment;
 Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC;
  - (b) At intervals of not more than two and a half years, with regard to:
    - (i) external condition;
    - (ii) proper functioning of service equipment;
 Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.
- Each IBC must correspond in all respects to its design type.
- 6.5.4.4.2 Every metal, rigid plastics and composite IBC for liquids, or for solids which are filled or discharged under pressure, must undergo a suitable leakproofness test. This test is part of a quality assurance programme as stipulated in 6.5.4.1 which shows the capability of meeting the appropriate test level indicated in 6.5.6.7.3.
- (a) before it is first used for transport; and
  - (b) at intervals of not more than two and a half years.
- For this test the IBC must be fitted with the primary bottom closure. The inner receptacle of a composite IBC may be tested without the outer casing, provided that the test results are not affected.
- 6.5.4.4.3 A report of each inspection and test must be kept by the owner of the IBC at least until the next inspection or test. The report must include the results of the inspection and test and must identify the party performing the inspection and test (see also the marking requirements in 6.5.2.2.1).
- 6.5.4.4.4 The competent authority may at any time require proof, by tests in accordance with this chapter, that IBCs meet the requirements of the design type tests.
- 6.5.4.5 Repaired IBCs**
- 6.5.4.5.1 When an IBC is impaired as a result of impact (e.g. accident) or any other cause, it must be repaired or otherwise maintained (see definition of "Routine maintenance of IBCs" in 1.2.1), so as to conform to the design type. The bodies of rigid plastics IBCs and the inner receptacles of composite IBCs that are impaired must be replaced.
- 6.5.4.5.2 In addition to any other testing and inspection requirements in this Code, an IBC must be subjected to the full testing and inspection requirements set out in 6.5.4.4, and the required reports must be prepared, whenever it is repaired.
- 6.5.4.5.3 The Party performing the tests and inspections after the repair must durably mark the IBC near the manufacturer's UN design type marks to show:

- (a) the State in which the tests and inspections were carried out;
- (b) the name or authorised symbol of the party performing the test and inspections; and
- (c) the date (month and year) of the tests and inspections.

6.5.4.5.4

Test and inspections performed in accordance with 6.5.4.5.2 may be considered to satisfy the requirements for the two and a half and five-year periodic tests and inspections.

## 6.5.5

## SPECIFIC REQUIREMENTS FOR IBCS

### 6.5.5.1

### Specific requirements for metal IBCs

6.5.5.1.1

These requirements apply to metal IBCs intended for the transport of solids and liquids. There are three categories of metal IBCs:

- (a) Those for solids which are filled or discharged by gravity (11A, 11B, 11N);
- (b) Those for solids which are filled or discharged at a gauge pressure greater than 10 kPa (0.1 bar) (21A, 21B, 21N); and
- (c) Those for liquids (31A, 31B, 31N).

6.5.5.1.2

Bodies must be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds must be skilfully made and afford complete safety. Low-temperature performance must be taken into account when appropriate.

6.5.5.1.3

Care must be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

6.5.5.1.4

Aluminium IBCs intended for the carriage of flammable liquids must have no movable parts, such as covers, closures, etc., made of unprotected steel liable to rust, which might cause a dangerous reaction by coming into frictional or percussive contact with the aluminium.

6.5.5.1.5

Metal IBCs must be made of metals which meet the following requirements:

- (a) For steel the elongation at fracture, in %, must not be less than  $\frac{10000}{R_m}$  with an absolute minimum of 20%, where  $R_m$  = guaranteed minimum tensile strength of the steel to be used, in N/mm<sup>2</sup>;
- (b) For aluminium the elongation at fracture, in %, must not be less than  $\frac{10000}{6R_m}$  with an absolute minimum of 8%, where  $R_m$  = guaranteed minimum tensile strength of the steel to be used, in N/mm<sup>2</sup>;

Specimens used to determine the elongation at fracture must be taken transversely to the direction of rolling and be so secured that:

$$L_0 = 5d \quad \text{or}$$

$$L_0 = 5.65 \sqrt{A}$$

where:  $L_0$  = gauge length of the specimen before the test

$d$  = diameter

$A$  = cross-sectional area of test specimen.

#### 6.5.5.1.6

Minimum wall thickness:

Metal IBCs with a capacity of more than 1500 l shall comply with the following minimum wall thickness requirement:

- (a) For a reference steel having a product of  $R_m \times A_0 = 10000$ , the wall thickness must not be less than:

| Wall thickness (T) in mm |                    |                                    |                    |
|--------------------------|--------------------|------------------------------------|--------------------|
| Types 11A, 11B, 11N      |                    | Types 21A, 21B, 21N, 31A, 31B, 31N |                    |
| Unprotected              | Protected          | Unprotected                        | Protected          |
| $T = C/2000 + 1.5$       | $T = C/2000 + 1.0$ | $T = C/1000 + 1.0$                 | $T = C/2000 + 1.5$ |

where:  $A_0$  = minimum elongation (as a percentage) of the reference steel to be used on fracture under tensile stress (see 6.5.5.1.5);

$C$  = capacity in litres;

- (b) For metals other than the reference steel described in (a), the minimum wall thickness is given by the following equivalence formula:

$$e_1 = \frac{21.4 \times e_0}{\sqrt[3]{R_{m1} \times A_1}}$$

where:  $e_1$  = required equivalent wall thickness of the metal to be used (in mm);

$e_0$  = required minimum wall thickness for the reference steel (in mm);

$R_{m1}$  = guaranteed minimum tensile strength of the metal to be used (in  $N/mm^2$ ) (see (c));

$A_1$  = minimum elongation (as a percentage) of the metal to be used on fracture under tensile stress (see 6.5.5.1.5);

However, in no case must the wall thickness be less than 1.5 mm.

- (c) For purposes of the calculation described in (b), the guaranteed minimum tensile strength of the metal to be used ( $R_{m1}$ ) must be the minimum value according to national or international material standards. However, for austenitic steels, the specified minimum value for  $R_m$  according to the material standards may be increased by up to 15% when a greater value is attested in the material inspection certificate. When no material standard exists for the material in question, the value of  $R_m$  must be the minimum value attested in the material inspection certificate.

6.5.5.1.7 Pressure relief requirements: IBCs for liquids must be capable of releasing a sufficient amount of vapour in the event of fire engulfment to ensure that no rupture of the body will occur. This can be achieved by conventional pressure-relief devices or by other constructional means. The start-to-discharge pressure must not be higher than 65 kPa (0.65 bar) and no lower than the total gauge pressure experienced in the IBC (i.e. the vapour pressure of the filling substance plus the partial pressure of the air or other inert gases, minus 100 kPa (1 bar)) at 55 °C, determined on the basis of a maximum degree of filling as defined in 4.1.1.4. The required relief devices must be fitted in the vapour space.

## **6.5.5.2 Specific requirements for flexible IBCs**

6.5.5.2.1 These requirements apply to flexible IBCs of the following types:

- 13H1 woven plastics without coating or liner
- 13H2 woven plastics, coated
- 13H3 woven plastics with liner
- 13H4 woven plastics, coated and with liner
- 13H5 plastics film
- 13L1 textile without coating or liner
- 13L2 textile, coated
- 13L3 textile with liner
- 13L4 textile, coated and with liner
- 13M1 paper, multiwall
- 13M2 paper, multiwall, water-resistant

Flexible IBCs are intended for the transport of solids only.

6.5.5.2.2 Bodies must be manufactured from suitable materials. The strength of the material and the construction of the flexible IBC must be appropriate to its capacity and its intended use.

6.5.5.2.3 All materials used in the construction of flexible IBCs of types 13M1 and 13M2 must, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.

6.5.5.2.4 Seams must be formed by stitching, heat sealing, gluing or any equivalent method. All stitched seam-ends must be secured.

6.5.5.2.5 Flexible IBCs must provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.

- 6.5.5.2.6 For flexible plastics IBCs where protection against ultraviolet radiation is required, it must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.2.7 Additives may be incorporated into the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.5.5.2.8 No material recovered from used receptacles must be used in the manufacture of IBC bodies. Production residues or scrap from the same manufacturing process may, however, be used. Component parts such as fittings and pallet bases may also be used provided such components have not in any way been damaged in previous use.
- 6.5.5.2.9 When filled, the ratio of height to width must be not more than 2:1.
- 6.5.5.2.10 The liner must be made of a suitable material. The strength of the material used and the construction of the liner must be appropriate to the capacity of the IBC and the intended use. Joins and closures must be sift proof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and transport.
- 6.5.5.3 Specific requirements for rigid plastics IBCs**
- 6.5.5.3.1 These requirements apply to rigid plastics IBCs for the transport of solids or liquids. Rigid plastics IBCs are of the following types:
- 11H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged by gravity
  - 11H2 freestanding, for solids which are filled or discharged by gravity
  - 21H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged under pressure
  - 21H2 freestanding, for solids which are filled or discharged under pressure
  - 31H1 fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for liquids
  - 31H2 freestanding, for liquids

- 6.5.5.3.2 The body must be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. Except for recycled plastics material as defined in 1.2.1, no used material other than production residues or regrind from the same manufacturing process may be used. The material must be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance must be taken into account when appropriate. Any permeation of the substance contained must not constitute a danger under normal conditions of transport.
- 6.5.5.3.3 Where protection against ultraviolet radiation is required, it must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.3.4 Additives may be incorporated in the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.5.5.4 Specific requirements for composite IBCs with plastics inner receptacles**
- 6.5.5.4.1 These requirements apply to composite IBCs for the transport of solids and liquids of the following types:
- 11HZ1 composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged by gravity
  - 11HZ2 composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged by gravity
  - 21HZ1 composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged under pressure
  - 21HZ2 composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged under pressure
  - 31HZ1 composite IBCs with a rigid plastics inner receptacle, for liquids
  - 31HZ2 composite IBCs with a flexible plastics inner receptacle, for liquids
- This code must be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.
- 6.5.5.4.2 The inner receptacle is not intended to perform a containment function without its outer casing. A “rigid” inner receptacle is a receptacle which retains its general shape when empty without closures in place and without benefit of the outer casing. Any inner receptacle that is not “rigid” is considered to be “flexible”.

- 6.5.5.4.3 The outer casing normally consists of rigid material formed so as to protect the inner receptacle from physical damage during handling and transport but is not intended to perform the containment function. It includes the base pallet where appropriate.
- 6.5.5.4.4 A composite IBC with a fully enclosing outer casing must be so designed that the integrity of the inner container may be readily assessed following the leakproofness and hydraulic tests.
- 6.5.5.4.5 IBCs of type 31HZ2 must be limited to a capacity of not more than 1250 litres.
- 6.5.5.4.6 The inner receptacle must be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. Except for recycled plastics material, as defined in 1.2.1, no used material other than production residues or reground from the same manufacturing process may be used. The material must be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance must be taken into account when appropriate. Any permeation of the substance contained must not constitute a danger under normal conditions of transport.
- 6.5.5.4.7 Where protection against ultraviolet radiation is required, it must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the inner receptacle. Where use is made of carbon black, pigments or inhibitors, other than those used in the manufacture of the tested design type, retesting may be waived if changes in carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.4.8 Additives may be incorporated in the material of the inner receptacle to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.5.5.4.9 The inner receptacle of IBCs type 31HZ2 must consist of at least three plies of film.
- 6.5.5.4.10 The strength of the material and the construction of the outer casing must be appropriate to the capacity of the composite IBC and its intended use.
- 6.5.5.4.11 The outer casing must be free of any projection that might damage the inner receptacle.
- 6.5.5.4.12 Outer casings of steel or aluminium must be constructed of a suitable metal of adequate thickness.
- 6.5.5.4.13 Outer casings of natural wood must be of well-seasoned wood, commercially dry and free from defects that would materially lessen the strength of any part of the casing. The tops and bottoms may be made of water-resistant reconstituted wood such as hardboard, particle board or other suitable type.

- 6.5.5.4.14 Outer casings of plywood must be made of well-seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the casing. All adjacent plies must be glued with water-resistant adhesive. Other suitable materials may be used with plywood for the construction of casings. Casings must be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.4.15 The walls of outer casings of reconstituted wood must be made of water-resistant reconstituted wood such as hardboard, particle board or other suitable type. Other parts of the casings may be made of other suitable material.
- 6.5.5.4.16 For fibreboard outer casings, strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) must be used appropriate to the capacity of the casing and to its intended use. The water resistance of the outer surface must be such that the increase in mass, as determined in a test carried out over 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m<sup>2</sup> - see ISO 535:2014. It must have proper bending qualities. Fibreboard must be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard must be firmly glued to the facings.
- 6.5.5.4.17 The ends of fibreboard outer casings may have a wooden frame or be entirely of wood. Reinforcements of wooden battens may be used.
- 6.5.5.4.18 Manufacturing joins in the fibreboard outer casing must be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joins must have an appropriate overlap. Where closing is effected by gluing or taping, a water-resistant adhesive must be used.
- 6.5.5.4.19 Where the outer casing is of plastics material, the relevant requirements of 6.5.5.4.6 to 6.5.5.4.9 apply.
- 6.5.5.4.20 The outer casing of a 31HZ2 must enclose the inner receptacle on all sides.
- 6.5.5.4.21 Any integral pallet base forming part of an IBC or any detachable pallet must be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.4.22 The pallet or integral base must be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.4.23 The outer casing must be secured to any detachable pallet to ensure stability in handling and transport. Where a detachable pallet is used, its top surface must be free from sharp protrusions that might damage the IBC.
- 6.5.5.4.24 Strengthening devices such as timber supports to increase stacking performance may be used but must be external to the inner receptacle.
- 6.5.5.4.25 Where IBCs are intended for stacking, the bearing surface must be such as to distribute the load in a safe manner. Such IBCs must be designed so that the load is not supported by the inner receptacle.

### **6.5.5.5**

### **Specific requirements for fibreboard IBCs**

- 6.5.5.5.1 These requirements apply to fibreboard IBCs for the transport of solids which are filled or discharged by gravity. Fibreboard IBCs are of the following type: 11G.
- 6.5.5.5.2 Fibreboard IBCs must not incorporate top lifting devices.
- 6.5.5.5.3 The body must be made of strong and good quality solid or double-faced corrugated fibreboard (single or multiwall), appropriate to the capacity of the IBC and to its intended use. The water resistance of the outer surface must be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m<sup>2</sup> - see ISO 535:2014. It must have proper bending qualities. Fibreboard must be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard must be firmly glued to the facings.
- 6.5.5.5.4 The walls, including top and bottom, must have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.
- 6.5.5.5.5 Manufacturing joins in the body of IBCs must be made with an appropriate overlap and must be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water-resistant adhesive must be used. Metal staples must pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.5.5.5.6 The liner must be made of a suitable material. The strength of the material used and the construction of the liner must be appropriate to the capacity of the IBC and the intended use. Joins and closures must be sift-proof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and transport.
- 6.5.5.5.7 Any integral pallet base forming part of an IBC or any detachable pallet must be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.5.8 The pallet or integral base must be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.5.9 The body must be secured to any detachable pallet to ensure stability in handling and transport. Where a detachable pallet is used, its top surface must be free from sharp protrusions that might damage the IBC.
- 6.5.5.5.10 Strengthening devices such as timber supports to increase stacking performance may be used but must be external to the liner.
- 6.5.5.5.11 Where IBCs are intended for stacking, the bearing surface must be such as to distribute the load in a safe manner.

## **6.5.5.6**

### **Specific requirements for wooden IBCs**

- 6.5.5.6.1 These requirements apply to wooden IBCs for the transport of solids which are filled or discharged by gravity. Wooden IBCs are of the following types:
- 11C natural wood with inner liner
  - 11D plywood with inner liner
  - 11F reconstituted wood with inner liner.
- 6.5.5.6.2 Wooden IBCs must not incorporate top lifting devices.
- 6.5.5.6.3 The strength of the materials used and the method of construction of the body must be appropriate to the capacity and intended use of the IBC.
- 6.5.5.6.4 Natural wood must be well-seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the IBC. Each part of the IBC must consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint; or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.
- 6.5.5.6.5 Bodies of plywood must be at least 3-ply. It must be made of well-seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the body. All adjacent plies must be glued with water-resistant adhesive. Other suitable materials may be used with plywood for the construction of the body.
- 6.5.5.6.6 Bodies of reconstituted wood must be made of water-resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.6.7 IBCs must be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.6.8 The liner must be made of a suitable material. The strength of the material used and the construction of the liner must be appropriate to the capacity of the IBC and the intended use. Joins and closures must be sift-proof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and transport.
- 6.5.5.6.9 Any integral pallet base forming part of an IBC or any detachable pallet must be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.6.10 The pallet or integral base must be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.6.11 The body must be secured to any detachable pallet to ensure stability in handling and transport. Where a detachable pallet is used, its top surface must be free from sharp protrusions that might damage the IBC.
- 6.5.5.6.12 Strengthening devices such as timber supports to increase stacking performance may be used but must be external to the liner.

6.5.5.6.13 Where IBCs are intended for stacking, the bearing surface must be such as to distribute the load in a safe manner.

## **6.5.6 TEST REQUIREMENTS FOR IBCS**

### **6.5.6.1 Performance and frequency of tests**

6.5.6.1.1 Each IBC design type must successfully pass the tests prescribed in this Chapter before being used. An IBC design type is defined by the design, size, material and thickness, manner of construction and means of filling and discharging but may include various surface treatments. It also includes IBCs which differ from the design type only in their lesser external dimensions.

6.5.6.1.2 Tests must be carried out on IBCs prepared for transport. IBCs must be filled as indicated in the relevant sections. The substances to be transported in the IBCs may be replaced by other substances except where this would invalidate the results of the tests. For solids, when another substance is used it must have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

### **6.5.6.2 Design type tests**

6.5.6.2.1 One IBC of each design type, size, wall thickness and manner of construction must be submitted to the tests listed in the order shown in 6.5.6.3.5 and as set out in 6.5.6.4 to 6.5.6.13. These design type tests must be carried out as required by the competent authority.

6.5.6.2.2 The competent authority may permit the selective testing of IBCs which differ only in minor respects from a tested type, e.g. with small reductions in external dimensions.

6.5.6.2.3 If detachable pallets are used in the tests, the test report issued in accordance with 6.5.6.14 must include a technical description of the pallets used.

### **6.5.6.3 Preparation of IBCs for testing**

6.5.6.3.1 Paper and fibreboard IBCs and composite IBCs with fibreboard outer casings must be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which must be chosen.

The preferred atmosphere is  $23 \pm 2$  °C and  $50\% \pm 2\%$  r.h.

The two other options are  $20 \pm 2$  °C and  $65\% \pm 2\%$  r.h.; or  $27 \pm 2$  °C and  $65\% \pm 2\%$  r.h.

**NOTE:** Average values must fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to  $\pm 5\%$  relative humidity without significant impairment of test reproducibility.

- 6.5.6.3.2 Additional steps must be taken to ascertain that the plastics material used in the manufacture of rigid plastics IBCs (types 31H1 and 31H2) and composite IBCs (types 31HZ1 and 31HZ2) complies respectively with the requirements in 6.5.5.3.2 to 6.5.5.3.4 and 6.5.5.4.6 to 6.5.5.4.9.
- 6.5.6.3.3 This may be done, for example, by submitting sample IBCs to a preliminary test extending over a long period, for example six months, during which the samples would remain filled with the substances they are intended to contain or with substances which are known to have at least as severe a stress-cracking, weakening or molecular degradation influence on the plastics materials in question, and after which the samples must be submitted to the applicable tests listed on the table in 6.5.6.3.5.
- 6.5.6.3.4 Where the behaviour of the plastics material has been established by other means, the above compatibility test may be dispensed with.
- 6.5.6.3.5: Design type tests required and sequential order

**Table 6.5.6.3.5: Design Type Tests Required and Sequential Order**

| Type of IBC                | Vibration <sup>f</sup> | Bottom lift      | Top lift <sup>a</sup> | Stacking <sup>b</sup> | Leak-proofness | Hydraulic pressure | Drop             | Tear | Toppling | Righting <sup>c</sup> |
|----------------------------|------------------------|------------------|-----------------------|-----------------------|----------------|--------------------|------------------|------|----------|-----------------------|
| Metal: 11A, 11B, 11N       |                        | 1st <sup>a</sup> | 2nd                   | 3rd                   | -              | -                  | 4th <sup>e</sup> | -    | -        | -                     |
| 21A, 21B, 21N              |                        | 1st <sup>a</sup> | 2nd                   | 3rd                   | 4th            | 5th                | 6th <sup>e</sup> | -    | -        | -                     |
| 31A, 31B, 31N              | 1st                    | 2nd <sup>a</sup> | 3rd                   | 4th                   | 5th            | 6th                | 7th <sup>e</sup> |      |          |                       |
| Flexible <sup>d</sup>      |                        | -                | x <sup>c</sup>        | x                     | -              | -                  | x                | x    | x        | x                     |
| Rigid plastics: 11H1, 11H2 |                        | 1st <sup>a</sup> | 2nd                   | 3rd                   | -              | -                  | 4th              | -    | -        | -                     |
| 21H1, 21H2                 |                        | 1st <sup>a</sup> | 2nd                   | 3rd                   | 4th            | 5th                | 6th              | -    | -        | -                     |
| 31H1, 31H2                 | 1st                    | 2nd <sup>a</sup> | 3rd                   | 4th                   | 5th            | 6th                | 7th              |      |          |                       |
| Composite: 11HZ1, 11HZ2    |                        | 1st <sup>a</sup> | 2nd                   | 3rd                   | -              | -                  | 4th <sup>e</sup> | -    | -        | -                     |

Table notes:

- a. When IBCs are designed for this method of handling.
- b. When IBCs are designed to be stacked.
- c. When IBCs are designated to be lifted from the top or the side.
- d. Required test indicated by x; an IBC which has passed one test may be used for other tests, in any order.
- e. Another IBC of the same design may be used for the drop test.
- f. Another IBC of the same design may be used for the vibration test.

#### **6.5.6.4 Bottom lift test**

##### **6.5.6.4.1 Applicability**

For all fibreboard and wooden IBCs, and for all types of IBC which are fitted with means of lifting from the base, as a design type test.

##### **6.5.6.4.2 Preparation of the IBC for test**

The IBC must be filled. A load must be added and evenly distributed. The mass of the filled IBC and the load must be 1.25 times the maximum permissible gross mass.

##### **6.5.6.4.3 Method of testing**

The IBC must be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks must penetrate to three quarters of the direction of entry. The test must be repeated from each possible direction of entry.

##### **6.5.6.4.4 Criteria for passing the test**

No permanent deformation which renders the IBC, including the base pallet, if any, unsafe for transport and no loss of contents.

#### **6.5.6.5 Top lift test**

##### **6.5.6.5.1 Applicability**

For all types of IBC which are designed to be lifted from the top and for flexible IBCs designed to be lifted from the top or the side, as a design type test.

##### **6.5.6.5.2 Preparation of the IBC for test**

Metal, rigid plastics and composite IBCs must be filled. A load must be added and evenly distributed. The mass of the filled IBC and the load must be twice the maximum permissible gross mass.

Flexible IBCs must be filled with a representative material and then must be loaded to six times their maximum permissible gross mass, the load being evenly distributed.

##### **6.5.6.5.3 Methods of testing**

Metal and flexible IBCs must be lifted in the manner for which they are designed until clear of the floor and maintained in that position for a period of five minutes.

Rigid plastics and composite IBCs must be lifted:

- (a) By each pair of diagonally opposite lifting devices, so that the hoisting forces are applied vertically, for a period of five minutes; and
- (b) By each pair of diagonally opposite lifting devices, so that the hoisting forces are applied toward the centre at 45° to the vertical, for a period of five minutes.

6.5.6.5.4 Other methods of top lift testing and preparation at least equally effective may be used for flexible IBCs.

6.5.6.5.5 Criteria for passing the test

- (a) Metal, rigid plastics and composite IBCs: the IBC remains safe for normal conditions of transport, there is no observable permanent deformation of the IBC, including the base pallet, if any, and no loss of contents;
- (b) Flexible IBCs: no damage to the IBC or its lifting devices which renders the IBC unsafe for transport or handling and no loss of contents.

## **6.5.6.6 Stacking test**

6.5.6.6.1 Applicability

For all types of IBC which are designed to be stacked on each other, as a design type test.

6.5.6.6.2 Preparation of the IBC for test

The IBC must be filled to its maximum permissible gross mass. If the specific gravity of the product being used for testing makes this impracticable, the IBC must be additionally loaded so that it is tested at its maximum permissible gross mass, the load being evenly distributed.

6.5.6.6.3 Methods of testing

- (a) The IBC must be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.5.6.6.4). IBCs must be subjected to the test load for a period of at least:
  - (i) 5 minutes, for metal IBCs;
  - (ii) 28 days at 40 °C, for rigid plastics IBCs of types 11H2, 21H2 and 31H2 and for composite IBCs with outer casings of plastics material which bear the stacking load (i.e., types 11HH1, 11HH2, 21HH1, 21HH2, 31HH1 and 31HH2);
  - (iii) 24 hours, for all other types of IBCs;
- (b) The load must be applied by one of the following methods:
  - (i) one or more IBCs of the same type filled to the maximum permissible gross mass stacked on the test IBC;
  - (ii) appropriate masses loaded onto either a flat plate or a reproduction of the base of the IBC, which is stacked on the test IBC.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.5.6.6.4      | <p>Calculation of superimposed test load</p> <p>The load to be placed on the IBC must be 1.8 times the combined maximum permissible gross mass of the number of similar IBCs that may be stacked on top of the IBC during transport.</p>                                                                                                                                                                                                                                                                    |
| 6.5.6.6.5      | <p>Criteria for passing the test</p> <p>(a) All types of IBCs other than flexible IBCs: no permanent deformation which renders the IBC including the base pallet, if any, unsafe for transport and no loss of contents;</p> <p>(b) Flexible IBCs: no deterioration of the body which renders the IBC unsafe for transport and no loss of contents.</p>                                                                                                                                                      |
| <b>6.5.6.7</b> | <b>Leakproofness test</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 6.5.6.7.1      | <p>Applicability</p> <p>For those types of IBCs used for liquids or for solids filled or discharged under pressure, as a design type test and periodic test.</p>                                                                                                                                                                                                                                                                                                                                            |
| 6.5.6.7.2      | <p>Preparation of the IBC for test</p> <p>The test must be carried out before the fitting of any thermal insulation equipment. Vented closures must either be replaced by similar non-vented closures or the vent must be sealed.</p>                                                                                                                                                                                                                                                                       |
| 6.5.6.7.3      | <p>Method of testing and pressure to be applied</p> <p>The test must be carried out for a period of at least 10 minutes using air at a gauge pressure of not less than 20 kPa (0.2 bar). The air tightness of the IBC must be determined by a suitable method such as by air-pressure differential test or by immersing the IBC in water or, for metal IBCs, by coating the seams and joints with a soap solution. In the latter case a correction factor must be applied for the hydrostatic pressure.</p> |
| 6.5.6.7.4      | <p>Criterion for passing the test</p> <p>No leakage of air.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>6.5.6.8</b> | <b>Hydraulic pressure test</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6.5.6.8.1      | <p>Applicability</p> <p>For those types of IBCs used for liquids or for solids filled or discharged under pressure, as a design type test.</p>                                                                                                                                                                                                                                                                                                                                                              |
| 6.5.6.8.2      | <p>Preparation of the IBC for test</p> <p>The test must be carried out before the fitting of any thermal insulation equipment. | 6.5.6.8.3      | <p>Method of testing</p> <p>The test must be carried out for a period of at least 10 minutes applying a hydraulic pressure not less than that indicated in 6.5.6.8.4. The IBCs must not be mechanically restrained during the test.</p>                                                                                                                                                                                                                                                                     |
| 6.5.6.8.4      | Pressures to be applied                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6.5.6.8.4.1    | Metal IBCs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

- (a) For IBCs of types 21A, 21B and 21N, for packing group I solids, a 250 kPa (2.5 bar) gauge pressure;
- (b) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, for packing groups II or III substances, a 200 kPa (2 bar) gauge pressure;
- (c) In addition, for IBCs of types 31A, 31B and 31N, a 65 kPa (0.65 bar) gauge pressure. This test must be performed before the 200 kPa test.

#### 6.5.6.8.4.2

##### Rigid plastics and composite IBCs

- (a) For IBCs of types 21H1, 21H2, 21HZ1 and 21HZ2: 75 kPa (0.75 bar) (gauge);
- (b) For IBCs of types 31H1, 31H2, 31HZ1 and 31HZ2: whichever is the greater of two values, the first as determined by one of the following methods:
  - (i) the total gauge pressure measured in the IBC (i.e. the vapour pressure of the filling substance and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C multiplied by a safety factor of 1.5; this total gauge pressure must be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C;
  - (ii) 1.75 times the vapour pressure at 50 °C of the substance to be transported minus 100 kPa, but with a minimum test pressure of 100 kPa;
  - (iii) 1.5 times the vapour pressure at 55 °C of the substance to be transported minus 100 kPa, but with a minimum test pressure of 100 kPa;
 and the second as determined by the following method:
  - (iv) twice the static pressure of the substance to be transported, with a minimum of twice the static pressure of water.

#### 6.5.6.8.5

##### Criteria for passing the test(s)

- (a) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (a) or (b): no leakage;
- (b) For IBCs of types 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1(c): neither permanent deformation which would render the IBC unsafe for transport, nor leakage;
- (c) For rigid plastics and composite IBCs: no permanent deformation which would render the IBC unsafe for transport and no leakage.

### 6.5.6.9

#### Drop test

#### 6.5.6.9.1

##### Applicability

For all types of IBCs, as a design type test.

#### 6.5.6.9.2

##### Preparation of the IBC for test

- (a) Metal IBCs: the IBC must be filled to not less than 95% of its maximum capacity for solids or 98% of its capacity for liquids. Pressure-relief devices must be removed and their apertures plugged, or must be rendered inoperative;

- (b) Flexible IBCs: the IBC must be filled to the maximum permissible gross mass, the contents being evenly distributed;
- (c) Rigid plastics and composite IBCs: the IBC must be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Arrangements provided for pressure-relief may be removed and plugged or rendered inoperative. Testing of IBCs must be carried out when the temperature of the test sample and its contents has been reduced to minus 18 °C or lower. Where test samples of composite IBCs are prepared in this way the conditioning specified in 6.5.6.3.1 may be waived. Test liquids must be kept in the liquid state, if necessary by the addition of anti-freeze. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures;
- (d) Fibreboard and wooden IBCs: the IBC must be filled to not less than 95% of its maximum capacity.

#### 6.5.6.9.3

##### Method of testing

The IBC must be dropped on its base onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the IBC considered to be the most vulnerable. IBCs of 0.45m<sup>3</sup> or less capacity must also be dropped:

- (a) Metal IBCs: on the most vulnerable part other than the part of the base tested in the first drop;
- (b) Flexible IBCs: on the most vulnerable side;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: flat on a side, flat on the top and on a corner.

The same IBC or a different IBC of the same design may be used for each drop.

#### 6.5.6.9.4

##### Drop height

For solids and liquids, if the test is performed with the solid or liquid to be transported or with another substance having essentially the same physical characteristics:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| 1.8 m           | 1.2 m            | 0.8 m             |

For liquids if the test is performed with water:

- (a) Where the substances to be transported have a relative density not exceeding 1.2:

| Packing group II | Packing group III |
|------------------|-------------------|
| 1.2 m            | 0.8 m             |

- (b) Where the substances to be transported have a relative density exceeding 1.2, the drop heights must be calculated on the basis of the relative density (d) of the substance to be transported rounded up to the first decimal as follows:

| Packing group II | Packing group III |
|------------------|-------------------|
| d × 1.0 m        | d × 0.67 m        |

6.5.6.9.5

Criteria for passing the test(s)

- (a) Metal IBCs: no loss of contents;
- (b) Flexible IBCs: no loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact must not be considered to be a failure of the IBC provided that no further leakage occurs after the IBC has been raised clear of the ground;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: no loss of contents. A slight discharge from a closure upon impact must not be considered to be a failure of the IBC provided that no further leakage occurs.
- (d) All IBCs: no damage which renders the IBC unsafe to be transported for salvage or for disposal, and no loss of contents. In addition, the IBC must be capable of being lifted by an appropriate means until clear of the floor for five minutes.

**NOTE:** The criteria in (d) apply to design types for IBCs manufactured as from 1 January 2011.

## 6.5.6.10

### Tear test

6.5.6.10.1

Applicability

For all types of flexible IBCs, as a design type test.

6.5.6.10.2

Preparation of the IBC for test

The IBC must be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.10.3

Method of testing

Once the IBC is placed on the ground, a 100 mm knife score, completely penetrating the wall of a wide face, is made at a 45° angle to the principal axis of the IBC, halfway between the bottom surface and the top level of the contents. The IBC must then be subjected to a uniformly distributed superimposed load equivalent to twice the maximum permissible gross mass. The load must be applied for at least five minutes. An IBC which is designed to be lifted from the top or the side must then, after removal of the superimposed load, be lifted clear of the floor and maintained in that position for a period of five minutes.

6.5.6.10.4

Criterion for passing the test

The cut must not propagate more than 25% of its original length.

## 6.5.6.11

### Topple test

6.5.6.11.1

Applicability

For all types of flexible IBCs, as a design type test.

6.5.6.11.2

Preparation of the IBC for test

The IBC must be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.11.3

Method of testing

The IBC must be caused to topple on to any part of its top on to a rigid, non-resilient, smooth, flat and horizontal surface.

6.5.6.11.4

Topple height

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| 1.8 m           | 1.2 m            | 0.8 m             |

6.5.6.11.5

Criterion for passing the test

No loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact must not be considered to be a failure of the IBC provided that no further leakage occurs.

6.5.6.12

Righting test

6.5.6.12.1

Applicability

For all flexible IBCs designed to be lifted from the top or side, as a design type test.

6.5.6.12.2

Preparation of the IBC for test

The IBC must be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.12.3

Method of testing

The IBC, lying on its side, must be lifted at a speed of at least 0.1 m/s to upright position, clear of the floor, by one lifting device or by two lifting devices when four are provided.

6.5.6.12.4

Criterion for passing the test

No damage to the IBC or its lifting devices which renders the IBC unsafe for transport or handling.

6.5.6.13

Vibration test

6.5.6.13.1

Applicability

For all IBCs used for liquids, as a design type test.

**NOTE:** This test applies to design types for IBCs manufactured as from 1 January 2011.

6.5.6.13.2

Preparation of the IBC for test

A sample IBC must be selected at random and must be fitted and closed as for transport. The IBC must be filled with water to not less than 98% of its maximum capacity.

6.5.6.13.3

Test method and duration

6.5.6.13.3.1

The IBC must be placed in the centre of the test machine platform with a vertical sinusoidal, double amplitude (peak-to peak displacement) of 25 mm ± 5%. If necessary, restraining devices must be attached to the platform to prevent the specimen from moving horizontally off the platform without restricting vertical movement.

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.5.6.13.3.2    | <p>The test must be conducted for one hour at a frequency that causes part of the base of the IBC to be momentarily raised from the vibrating platform for part of each cycle to such a degree that a metal shim can be completely inserted intermittently at, at least, one point between the base of the IBC and the test platform. The frequency may need to be adjusted after the initial set point to prevent the packaging from going into resonance. Nevertheless, the test frequency must continue to allow placement of the metal shim under the IBC as described in this paragraph. The continuing ability to insert the metal shim is essential to passing the test. The metal shim used for this test must be at least 1.6 mm thick, 50 mm wide, and be of sufficient length to be inserted between the IBC and the test platform a minimum of 100 mm to perform the test.</p>                                                                                                                                                                          |
| 6.5.6.13.4      | <p>Criteria for passing the test</p> <p>No leakage or rupture must be observed. In addition, no breakage or failure of structural components, such as broken welds or failed fastenings, must be observed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>6.5.6.14</b> | <b>Test report</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 6.5.6.14.1      | <p>A test report containing at least the following particulars must be drawn up and must be available to the users of the IBC:</p> <ol style="list-style-type: none"> <li>1. Name and address of the test facility.</li> <li>2. Name and address of applicant (where appropriate).</li> <li>3. A unique test report identification.</li> <li>4. Date of the test report.</li> <li>5. Manufacturer of the IBC.</li> <li>6. Description of the IBC design type (e.g. dimensions, materials, closures, thickness, etc.) including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s).</li> <li>7. Maximum capacity.</li> <li>8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids. For rigid plastics and composite IBCs subject to the hydraulic pressure test in 6.5.6.8, the temperature of the water used.</li> <li>9. Test descriptions and results.</li> <li>10. The test report must be signed with the name and status of the signatory.</li> </ol> |
| 6.5.6.14.2      | <p>The test report must contain statements that the IBC prepared as for transport was tested in accordance with the appropriate requirements of this chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report must be available to the competent authority.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## CHAPTER 6.6: REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF LARGE PACKAGINGS

### 6.6.1 GENERAL

#### 6.6.1.1 The requirements of this Chapter do not apply to:

- (a) Class 2, except articles including aerosols;
- (b) Division 6.2, except clinical waste of UN 3291;
- (c) Class 7 packages containing radioactive material.

6.6.1.2 Large packagings must be manufactured, tested and remanufactured under a quality assurance programme in order to ensure that each manufactured or remanufactured large packaging meets the requirements of this chapter.

**NOTE:** ISO 16106:2020 “Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001” provides acceptable guidance on procedures which may be followed.

6.6.1.3 The specific requirements for large packagings in 6.6.4 are based on large packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of large packagings having specifications different from those in 6.6.4 provided they are equally effective, acceptable to the competent authority and able to successfully successfully fulfil the requirements described in 6.6.5. Methods of testing other than those described in this Code are acceptable provided they are equivalent.

6.6.1.4 Manufacturers and subsequent distributors of packagings must provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for transport are capable of passing the applicable performance tests of this chapter.

### 6.6.2 CODE FOR DESIGNATING TYPES OF LARGE PACKAGINGS

#### 6.6.2.1 The code used for large packagings consists of:

- (a) Two Arabic numerals:
  - 50 for rigid large packagings; or
  - 51 for flexible large packagings; and
- (b) Capital letters in Latin characters indicating the nature of the material, e.g. wood, steel etc. The capital letters used must be those shown in 6.1.2.6.

### 6.6.2.2

The letters “T” or “W” may follow the large packaging code. The letter “T” signifies a large salvage packaging conforming to the requirements of 6.6.5.1.9 The letter “W” signifies that the large packaging, although of the same type indicated by the code, is manufactured to a specification different from those in 6.6.4 and is considered equivalent in accordance with the requirements in 6.6.1.3.

## 6.6.3

## MARKING

### 6.6.3.1

### Primary marking

Each large packaging manufactured and intended for the use according to this Code must bear marks which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols must be at least 12 mm high and must show:

- (a) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;

For metal large packagings on which the marks are stamped or embossed, the capital letters “UN” may be applied instead of the symbol;

- (b) The code “50” designating a large rigid packaging or “51” for flexible large packagings, followed by the material type in accordance with 6.5.1.4.1(b);
- (c) A capital letter designating the packing group(s) for which the design type has been approved:

X for packing groups I, II and III

Y for packing groups II and III

Z for packing group III only;

- (d) The month and year (last two digits) of manufacture;
- (e) The State authorising the allocation of the mark; indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup>(AUS for Australia);
- (f) The name or symbol of the manufacturer and other identification of the large packagings as specified by the competent authority;
- (g) The stacking test load in kg. For large packagings not designed for stacking the figure “0” must be shown;
- (h) The maximum permissible gross mass in kilograms.

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

The primary marks required above must be applied in the sequence of the sub-paragraphs.

Each mark applied in accordance with (a) to (h) must be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

**6.6.3.2 Examples of the marking:**

|  |                                  |                                                                                                                 |
|--|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
|  | 50 A/X/05/01/N/PQRS<br>2500/1000 | For a large steel packaging suitable for stacking; stacking load: 2500 kg; maximum gross mass: 1000 kg.         |
|  | 50AT/Y/05/01/B/PQRS<br>2500/1000 | For a large steel salvage packaging suitable for stacking; stacking load: 2500 Kg; maximum gross mass: 1000 kg. |
|  | 50 H/Y04/02/D/ABCD<br>987/0/800  | For a large plastics packaging not suitable for stacking; maximum gross mass: 800 kg.                           |
|  | 51H/Z/06/01/S/1999/<br>0/500     | For a large flexible packaging not suitable for stacking; maximum gross mass: 500 kg.                           |

6.6.3.3 The maximum permitted stacking load applicable must be displayed on a symbol as shown in figure 6.6.1 or figure 6.6.2. The symbol must be durable and clearly visible.

The minimum dimensions must be 100 mm x 100 mm. The letters and numbers indicating the mass must be at least 12 mm high. The area

within the printer's marks indicated by the dimensional arrows must be square. Where dimensions are not specified, all features must be in approximate proportion to those shown. The mass marked above the symbol must not exceed the load imposed during the design type test (see 6.6.5.3.3.4) divided by 1.8.

**NOTE:** *The provisions of 6.6.3.3 must apply to all large packagings manufactured, repaired or remanufactured as from 1 January 2015. The provisions of 6.6.3.3 from version 7.4 of the ADG Code may continue to be applied to all large packagings manufactured, repaired or remanufactured between 1 January 2015 and 31 December 2016.*

6.6.3.4 Where a large packaging conforms to one or more than one tested large packaging design type, including one or more than one tested packaging or IBC design type, the large packaging may bear more than one mark to indicate the relevant performance test requirements that have been met. Where more than one mark appears on a large packaging, the marks must appear in close proximity to one another and each mark must appear in its entirety.

## **6.6.4 SPECIFIC REQUIREMENTS FOR LARGE PACKAGINGS**

### **6.6.4.1 Specific requirements for metal large packagings**

50A steel

50B aluminium

50N metal (other than steel or aluminium)

6.6.4.1.1 The large packaging must be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds must be skilfully made and afford complete safety. Low-temperature performance must be taken into account when appropriate.

6.6.4.1.2 Care must be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

### **6.6.4.2 Specific requirements for flexible material large packagings**

51H flexible plastics

51M flexible paper

6.6.4.2.1 The large packaging must be manufactured from suitable materials. The strength of the material and the construction of the flexible large packagings must be appropriate to its capacity and its intended use.

6.6.4.2.2 All materials used in the construction of flexible large packagings of types 51M must, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.

6.6.4.2.3 Seams must be formed by stitching, heat sealing, gluing or any equivalent method. All stitched seam-ends must be secured.

- 6.6.4.2.4 Flexible large packagings must provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.
- 6.6.4.2.5 For plastics flexible large packagings where protection against ultraviolet radiation is required, it must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the large packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.6.4.2.6 Additives may be incorporated into the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.6.4.2.7 When filled, the ratio of height to width must be not more than 2:1.
- 6.6.4.3 Specific requirements for plastics large packagings**
- 50H rigid plastics
- 6.6.4.3.1 The large packaging must be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material must be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance must be taken into account when appropriate. Any permeation of the substance contained must not constitute a danger under normal conditions of transport.
- 6.6.4.3.2 Where protection against ultraviolet radiation is required, it must be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives must be compatible with the contents and remain effective throughout the life of the outer packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.6.4.3.3 Additives may be incorporated in the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.6.4.4 Specific requirements for fibreboard large packagings**
- 50G rigid fibreboard

- 6.6.4.4.1 Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) must be used, appropriate to the capacity of the large packagings and to their intended use. The water resistance of the outer surface must be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m<sup>2</sup> – see ISO 535:2014. It must have proper bending qualities. Fibreboard must be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard must be firmly glued to the facings.
- 6.6.4.4.2 The walls, including top and bottom, must have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.
- 6.6.4.4.3 Manufacturing joins in the outer packaging of large packagings must be made with an appropriate overlap and must be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water-resistant adhesive must be used. Metal staples must pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.6.4.4.4 Any integral pallet base forming part of a large packaging or any detachable pallet must be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.4.5 The pallet or integral base must be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.4.6 The body must be secured to any detachable pallet to ensure stability in handling and transport. Where a detachable pallet is used, its top surface must be free from sharp protrusions that might damage the large packaging.
- 6.6.4.4.7 Strengthening devices such as timber supports to increase stacking performance may be used but must be external to the liner.
- 6.6.4.4.8 Where large packagings are intended for stacking, the bearing surface must be such as to distribute the load in a safe manner.
- 6.6.4.5 Specific requirements for wooden large packagings**
- 50C natural wood
- 50D plywood
- 50F reconstituted wood
- 6.6.4.5.1 The strength of the materials used and the method of construction must be appropriate to the capacity and intended use of the large packagings.

- 6.6.4.5.2 Natural wood must be well-seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the large packagings. Each part of the large packagings must consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint; or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.
- 6.6.4.5.3 Large packagings of plywood must be at least 3-ply. They must be made of well-seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the large packaging. All adjacent plies must be glued with water-resistant adhesive. Other suitable materials may be used with plywood for the construction of the large packaging.
- 6.6.4.5.4 Large packagings of reconstituted wood must be made of water-resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.6.4.5.5 Large packagings must be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.6.4.5.6 Any integral pallet base forming part of a large packaging or any detachable pallet must be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.5.7 The pallet or integral base must be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.5.8 The body must be secured to any detachable pallet to ensure stability in handling and transport. Where a detachable pallet is used, its top surface must be free from sharp protrusions that might damage the large packaging.
- 6.6.4.5.9 Strengthening devices such as timber supports to increase stacking performance may be used but must be external to the liner.
- 6.6.4.5.10 Where large packagings are intended for stacking, the bearing surface must be such as to distribute the load in a safe manner.

## **6.6.5 TEST REQUIREMENTS FOR LARGE PACKAGINGS**

### **6.6.5.1 Performance and frequency of test**

- 6.6.5.1.1 The design type of each large packaging must be tested as provided in 6.6.5.3 in accordance with procedures established by the competent authority.

- 6.6.5.1.2 Each large packaging design type must successfully pass the tests prescribed in this Chapter before being used. A large packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes large packagings which differ from the design type only in their lesser design height.
- 6.6.5.1.3 Tests must be repeated on production samples at intervals established by the competent authority. For such tests on fibreboard large packagings, preparation at ambient conditions is considered equivalent to the provisions of 6.6.5.2.4.
- 6.6.5.1.4 Tests must also be repeated after each modification which alters the design, material or manner of construction of large packagings.
- 6.6.5.1.5 The competent authority may permit the selective testing of large packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and large packagings which are produced with small reductions in external dimension(s).
- 6.6.5.1.6 Reserved (by UN)
- NOTE:** *For the conditions for assembling different inner packagings in a large packaging and permissible variations in inner packagings, see 4.1.1.5.1.*
- 6.6.5.1.7 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced large packagings meet the requirements of the design type tests.
- 6.6.5.1.8 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.
- 6.6.5.1.9 Large Salvage Packagings
- Large salvage packagings must be tested and marked in accordance with the provisions applicable to packing group II large packagings intended for the transport of solids or inner packagings, except as follows:
- (a) The test substance used in performing the tests must be water, and the large salvage packagings must be filled to not less than 98% of their maximum capacity. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass so long as they are placed so that the test results are not affected. Alternatively, in performing the drop test, the drop height may be varied in accordance with 6.6.5.3.4.4.2 (b);
  - (b) Large salvage packagings must, in addition, have been successfully subjected to the leakproofness test at 30 kPa, with the results of this test reflected in the test report required by 6.6.5.4; and
  - (c) Large salvage packagings must be marked with the letter “T” as described in 6.6.2.2.

## 6.6.5.2 Preparation for testing

6.6.5.2.1 Tests must be carried out on large packagings prepared as for transport including the inner packagings or articles used. Inner packagings must be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. For large packagings where the inner packagings are designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances in the inner packagings or the articles to be transported in the large packagings may be replaced by other material or articles except where this would invalidate the results of the tests. When other inner packagings or articles are used they must have the same physical characteristics (mass, etc.) as the inner packagings or articles to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.6.5.2.2 In the drop tests for liquids, when another substance is used, it must be of similar relative density and viscosity to those of the substance being transported. Water may also be used for the liquid drop test under the conditions in 6.6.5.3.4.4.

6.6.5.2.3 Large packagings made of plastics materials and large packagings containing inner packagings of plastic materials - other than bags intended to contain solids or articles - must be drop tested when the temperature of the test sample and its contents has been reduced to -18°C or lower. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures. Where test sample are prepared in this way, the conditioning in 6.6.5.2.4 may be waived. Test liquids must be kept in the liquid state by the addition of anti-freeze if necessary.

6.6.5.2.4 Large packagings of fibreboard must be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h). There are three options, one of which must be chosen. The preferred atmosphere is  $23 \pm 2^\circ\text{C}$  and  $50\% \pm 2\%$  r.h. The two other options are:  $20 \pm 2^\circ\text{C}$  and  $65\% \pm 2\%$  r.h.; or  $27 \pm 2^\circ\text{C}$  and  $65\% \pm 2\%$  r.h.

**NOTE:** Average values must fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to  $\pm 5\%$  relative humidity without significant impairment of test reproducibility.

## 6.6.5.3 Test requirements

6.6.5.3.1 Bottom lift test

6.6.5.3.1.1 Applicability

For all types of large packagings which are fitted with means of lifting from the base, as a design type test.

6.6.5.3.1.2 Preparation of large packaging for test

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | The large packaging must be loaded to 1.25 times its maximum permissible gross mass, the load being evenly distributed.                                                                                                                                                                                                                                                                                                                                                  |
| 6.6.5.3.1.3 | <p>Method of testing</p> <p>The large packaging must be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks must penetrate to three quarters of the direction of entry. The test must be repeated from each possible direction of entry.</p>                                                                               |
| 6.6.5.3.1.4 | <p>Criteria for passing the test</p> <p>No permanent deformation which renders the large packaging unsafe for transport and no loss of contents.</p>                                                                                                                                                                                                                                                                                                                     |
| 6.6.5.3.2   | Top lift test                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6.6.5.3.2.1 | <p>Applicability</p> <p>For types of large packagings which are intended to be lifted from the top and fitted with means of lifting, as a design type test.</p>                                                                                                                                                                                                                                                                                                          |
| 6.6.5.3.2.2 | <p>Preparation of large packaging for test</p> <p>The large packaging must be loaded to twice its maximum permissible gross mass. A flexible large packaging must be loaded to six times its maximum permissible gross mass, the load being evenly distributed.</p>                                                                                                                                                                                                      |
| 6.6.5.3.2.3 | <p>Method of testing</p> <p>The large packaging must be lifted in the manner for which it is designed until clear of the floor and maintained in that position for a period of five minutes.</p>                                                                                                                                                                                                                                                                         |
| 6.6.5.3.2.4 | <p>Criteria for passing the test</p> <p>(a) All types of large packagings other than flexible and composite large packagings: no permanent deformation which renders the large packaging, including the base pallet, if any, unsafe for transport and no loss of contents;</p> <p>(b) Flexible large packagings: no damage to the large packaging or its lifting devices which renders the large packaging unsafe for transport or handling and no loss of contents.</p> |
| 6.6.5.3.3   | Stacking test                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6.6.5.3.3.1 | <p>Applicability</p> <p>For all types of large packagings which are designed to be stacked on each other, as a design type test.</p>                                                                                                                                                                                                                                                                                                                                     |
| 6.6.5.3.3.2 | <p>Preparation of large packaging for test</p> <p>The large packaging must be filled to its maximum permissible gross mass.</p>                                                                                                                                                                                                                                                                                                                                          |
| 6.6.5.3.3.3 | <p>Method of testing</p> <p>The large packaging must be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.6.5.3.3.4) for a period of at least five minutes. For large packagings of wood, fibreboard and plastics materials the period must be 24 h.</p>                                                                                                                                                    |
| 6.6.5.3.3.4 | Calculation of superimposed test load                                                                                                                                                                                                                                                                                                                                                                                                                                    |

The load to be placed on the large packaging must be 1.8 times the combined maximum permissible gross mass of the number of similar large packaging that may be stacked on top of the large packaging during transport.

#### 6.6.5.3.3.5

Criteria for passing the test

- (a) All types of large packagings other than flexible large packagings: no permanent deformation which renders the large packaging including the base pallet, if any, unsafe for transport and no loss of contents;
- (b) Flexible large packagings: no deterioration of the body which renders the large packaging unsafe for transport and no loss of contents.

#### 6.6.5.3.4

Drop test

##### 6.6.5.3.4.1

Applicability

For all types of large packagings as a design type test.

##### 6.6.5.3.4.2

Preparation of large packaging for testing

The large packaging must be filled in accordance with 6.6.5.2.1.

##### 6.6.5.3.4.3

Method of testing

The large packaging must be dropped onto a non-resilient, horizontal, flat massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the large packaging considered to be the most vulnerable.

##### 6.6.5.3.4.4

Drop height

**NOTE:** Large packagings for substances and articles of Class 1 are to be tested at the packing group II performance level.

##### 6.6.5.3.4.4.1

For inner packagings containing solid or liquid substances or articles, if the test is performed with the solid, liquid or articles to be transported, or with another substance or article having essentially the same characteristics:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| 1.8 m           | 1.2 m            | 0.8 m             |

##### 6.6.5.3.4.4.2

For inner packagings containing liquids if the test is performed with water:

- (a) Where the substances to be transported have a relative density not exceeding 1.2:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| 1.8 m           | 1.2 m            | 0.8 m             |

- (b) Where the substances to be transported have a relative density exceeding 1.2, the drop height must be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal, as follows:

| Packing group I | Packing group II | Packing group III |
|-----------------|------------------|-------------------|
| d x 1.5 (m)     | d x 1.0 (m)      | d x 0.67 (m)      |

6.6.5.3.4.5

Criteria for passing the test

6.6.5.3.4.5.1

The large packaging must not exhibit any damage liable to affect safety during transport. There must be no leakage of the filling substance from inner packaging(s) or article(s).

6.6.5.3.4.5.2

No rupture is permitted in large packagings for articles of Class 1 which would permit the spillage of loose explosive substances or articles from the large packaging.

6.6.5.3.4.5.3

Where a large packaging undergoes a drop test, the sample passes the test if the entire contents are retained even if the closure is no longer sift-proof.

## 6.6.5.4

### Certification and test report

6.6.5.4.1

In respect of each design type of large packaging a certificate and mark (as in 6.6.3) must be issued attesting that the design type including its equipment meets the test requirements.

6.6.5.4.2

A test report containing at least the following particulars must be drawn up and must be available to the users of the large packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the large packaging;
6. Description of the large packaging design type (e.g. dimensions, materials, closures, thickness, etc.) and/or photograph(s);
7. Maximum capacity/maximum permissible gross mass;
8. Characteristics of test contents, e.g. types and descriptions of inner packagings or articles used;
9. Test descriptions and results;
10. The test report must be signed with the name and status of the signatory.

6.6.5.4.3

The test report must contain statements that the large packaging prepared as for transport was tested in accordance with the appropriate provisions of this chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report must be available to the competent authority.

## CHAPTER 6.7: REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF PORTABLE TANKS AND MULTIPLE-ELEMENT GAS CONTAINERS (MEGCs)

**NOTE:** The requirements of this Chapter also apply to portable tanks with shells made of Fibre-Reinforced Plastics (FRP) to the extent indicated in Chapter 6.9

### 6.7.1 APPLICATION AND GENERAL REQUIREMENTS

**NOTE:** The requirements of this Chapter also apply to portable tanks and shells made of fibre-reinforced plastics (FRP) to the extent indicated in Chapter 6.9.

- 6.7.1.1 The requirements of this chapter apply to portable tanks intended for the transport of dangerous goods of Classes 2, 3, 4, 5, 6, 7, 8 and 9, and to MEGCs intended for the transport of non-refrigerated gases of Class 2, by all modes of transport. In addition to the requirements of this chapter, unless otherwise specified, the applicable requirements of the International Convention for Safe Containers (CSC) 1972, as amended, must be fulfilled by any multimodal portable tank or MEGC which meets the definition of a “container” within the terms of that Convention. Additional requirements may apply to offshore portable tanks or MEGCs that are handled in open seas.
- 6.7.1.2 In recognition of scientific and technological advances, the technical requirements of this chapter may be varied by alternative arrangements. These alternative arrangements must offer a level of safety not less than that given by the requirements of this chapter with respect to the compatibility with substances transported and the ability of the portable tank or MEGC to withstand impact, loading and fire conditions. For international transport, alternative arrangement portable tanks or MEGCs must be approved by the applicable competent authorities.
- 6.7.1.3 When a substance is not assigned a portable tank instruction (T1 to T23, T50 or T75) in Column 10 of the Dangerous Goods List in chapter 3.2, a determination in accordance with Regulation 1.5.1(2) may be issued by the competent authority of the jurisdiction of origin. The determination must be included in the documentation of the consignment and contain as a minimum the information normally provided in the portable tank instructions and the conditions under which the substance must be transported. Appropriate measures should be initiated by the competent authority to include the assignment in the Dangerous Goods List.
- 6.7.2 **REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF PORTABLE TANKS INTENDED FOR THE TRANSPORT OF SUBSTANCES OF CLASS 1 AND CLASSES 3 TO 9**
- 6.7.2.1 **Definitions**

For the purposes of this section:

**Design pressure** means the pressure to be used in calculations required by a recognised pressure vessel code. The design pressure must be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
  - (i) the absolute vapour pressure (in bar) of the substance at 65 °C (at highest temperature during filling, discharge or transport for substances transported above 65 °C), minus 1 bar; and
  - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of  $t_r - t_f$  ( $t_f$  = filling temperature usually 15 °C;  $t_r$  = 50 °C maximum mean bulk temperature); and
  - (iii) a head pressure determined on the basis of the static forces specified in 6.7.2.2.12, but not less than 0.35 bar; or
- (c) Two thirds of the minimum test pressure specified in the applicable portable tank instruction in 4.2.5.2.6;

**Design temperature range** for the shell must be -40 °C to 50 °C for substances transported under ambient conditions. For the other substances handled under elevated temperature conditions the design temperature must be not less than the maximum temperature of the substance during filling, discharge or transport. More severe design temperatures must be considered for portable tanks subjected to severe climatic conditions;

**Fine grain steel** means steel which has a ferritic grain size of 6 or finer when determined in accordance with ASTM E 112-96 or as defined in EN 10028-3, Part 3;

**Fusible element** means a non-reclosable pressure relief device that is thermally actuated;

**Leakproofness test** means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

**Maximum allowable working pressure (MAWP)** means a pressure that must be not less than the highest of the following pressures measured at the top of the shell while in operating position:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed which must be not less than the sum of:
  - (i) the absolute vapour pressure (in bar) of the substance at 65 °C (at the highest temperature during filling, discharge or transport for substances transported above 65 °C), minus 1 bar; and
  - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk

temperature of tr - tf (tf = filling temperature, usually 15 °C; tr = 50 °C, maximum mean bulk temperature);

**Maximum permissible gross mass (MPGM)** means the sum of the tare mass of the portable tank and the heaviest load authorised for transport;

**Mild steel** means a steel with a guaranteed minimum tensile strength of 360 N/mm<sup>2</sup> to 440 N/mm<sup>2</sup> and a guaranteed minimum elongation at fracture conforming to 6.7.2.3.3.3;

**Offshore portable tank** means a portable tank specially designed for repeated use for transport of dangerous goods to, from and between offshore facilities. An offshore portable tank is designed and constructed in accordance with the Guidelines for the Approval of Containers Handled in Open Seas specified by the International Maritime Organisation in document MSC/Circ.860;

**Portable tank** means a multimodal tank used for the transport of substances of Class 1 and Classes 3 to 9. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the transport of dangerous substances. The portable tank must be capable of being filled and discharged without the removal of its structural equipment. It must possess stabilising members external to the shell, and must be capable of being lifted when full. It must be designed primarily to be loaded onto a transport vehicle or ship and must be equipped with skids, mountings or accessories to facilitate mechanical handling. Road tank-vehicles, rail tank-wagons, non-metallic tanks and intermediate bulk containers (IBCs) are not considered to fall within the definition for portable tanks;

**Reference steel** means a steel with a tensile strength of 370 N/mm<sup>2</sup> and an elongation at fracture of 27%;

**Service equipment** means measuring instruments and filling, discharge, venting, safety, heating, cooling and insulating devices;

**Shell** means the part of the portable tank which retains the substance intended for transport (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

**Structural equipment** means the reinforcing, fastening, protective and stabilising members external to the shell;

**Test pressure** means the maximum gauge pressure at the top of the shell during the hydraulic pressure test equal to not less than 1.5 times the design pressure. The minimum test pressure for portable tanks intended for specific substances is specified in the applicable portable tank instruction in 4.2.5.2.6.

## 6.7.2.2

### General design and construction requirements

#### 6.7.2.2.1

Shells must be designed and constructed in accordance with the requirements of a pressure vessel code recognised by the competent authority. Shells must be made of metallic materials suitable for forming. The materials must in principle conform to national or international material standards. For welded shells only a material whose weldability has been fully demonstrated must be used. Welds must be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells must be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the design temperature range must be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength must be not more than 460 N/mm<sup>2</sup> and the guaranteed value of the upper limit of the tensile strength must be not more than 725 N/mm<sup>2</sup> according to the material specification. Aluminium may only be used as a construction material when indicated in a portable tank special provision assigned to a specific substance in Column 11 of the Dangerous Goods List or when determined by the competent authority. When aluminium is authorised, it must be insulated to prevent significant loss of physical properties when subjected to a heat load of 110 kW/m<sup>2</sup> for a period of not less than 30 minutes. The insulation must remain effective at all temperatures less than 649 °C and must be jacketed with a material with a melting point of not less than 700 °C. Portable tank materials must be suitable for the external environment in which they may be transported.

#### 6.7.2.2.2

Portable tank shells, fittings, and pipework must be constructed from materials which are:

- (a) Substantially immune to attack by the substance(s) intended to be transported; or
- (b) Properly passivated or neutralised by chemical reaction; or
- (c) Lined with corrosion-resistant material directly bonded to the shell or attached by equivalent means.

#### 6.7.2.2.3

Gaskets must be made of materials not subject to attack by the substance(s) intended to be transported.

#### 6.7.2.2.4

When shells are lined, the lining must be substantially immune to attack by the substance(s) intended to be transported, homogeneous, non porous, free from perforations, sufficiently elastic and compatible with the thermal expansion characteristics of the shell. The lining of every shell, shell fittings and piping must be continuous, and must extend around the face of any flange. Where external fittings are welded to the tank, the lining must be continuous through the fitting and around the face of external flanges.

#### 6.7.2.2.5

Joints and seams in the lining must be made by fusing the material together or by other equally effective means.

#### 6.7.2.2.6

Contact between dissimilar metals which could result in damage by galvanic action must be avoided.

- 6.7.2.2.7 The materials of the portable tank, including any devices, gaskets, linings and accessories, must not adversely affect the substance(s) intended to be transported in the portable tank.
- 6.7.2.2.8 Portable tanks must be designed and constructed with supports to provide a secure base during transport and with suitable lifting and tie-down attachments.
- 6.7.2.2.9 Portable tanks must be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and transport. The design must demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.2.2.9.1 For portable tanks that are intended for use offshore, the dynamic stresses imposed by handling in open seas must be taken into account.
- 6.7.2.2.10 A shell which is to be equipped with a vacuum-relief device must be designed to withstand, without permanent deformation, an external pressure of not less than 0.21 bar above the internal pressure. The vacuum-relief device must be set to relieve at a vacuum setting not greater than minus 0.21 bar unless the shell is designed for a higher external over pressure, in which case the vacuum-relief pressure of the device to be fitted must be not greater than the tank design vacuum pressure. A shell used for the transport of solid substances of packing groups II or III only, which do not liquefy during transport, may be designed for a lower external pressure, subject to competent authority approval. In this case, the vacuum-relief device must be set to relieve at this lower pressure. A shell that is not to be fitted with a vacuum-relief device must be designed to withstand, without permanent deformation, an external pressure of not less than 0.4 bar above the internal pressure.
- 6.7.2.2.11 Vacuum-relief devices used on portable tanks intended for the transport of substances meeting the flash point criteria of Class 3, including elevated temperature substances transported at or above their flash point, must prevent the immediate passage of flame into the shell, or the portable tank must have a shell capable of withstanding, without leakage an internal explosion resulting from the passage of flame into the shell.
- 6.7.2.2.12 Portable tanks and their fastenings must, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces must be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>; and

---

<sup>1</sup>For calculation purposes for  $g = 9.81 \text{ m/s}^2$ .

- (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)<sup>1</sup>.
- 6.7.2.2.13 Under each of the forces in 6.7.2.2.12, the safety factor to be observed must be as follows:
- (a) For metals having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
  - (b) For metals with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.2.2.14 The values of yield strength or proof strength must be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength or proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the value of yield strength or proof strength used must be approved by the competent authority.
- 6.7.2.2.15 Portable tanks must be capable of being electrically earthed when intended for the transport of substances meeting the flash point criteria of Class 3 including elevated temperature substances transported at or above their flash point. Measures must be taken to prevent dangerous electrostatic discharge.
- 6.7.2.2.16 When required for certain substances by the applicable portable tank instruction indicated in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6, or by a portable tank special provision indicated in Column 11 of the Dangerous Goods List and described in 4.2.5.3, portable tanks must be provided with additional protection, which may take the form of additional shell thickness or a higher test pressure, the additional shell thickness or higher test pressure being determined in the light of the inherent risks associated with the transport of the substances concerned.
- 6.7.2.2.17 Thermal insulation directly in contact with the shell intended for substances transported at elevated temperature must have an ignition temperature at least 50 °C higher than the maximum design temperature of the tank.
- 6.7.2.3 Design criteria**
- 6.7.2.3.1 Shells must be of a design capable of being stress-analysed mathematically or experimentally by resistance strain gauges, or by other methods approved by the competent authority.

- 6.7.2.3.2 Shells must be designed and constructed to withstand a hydraulic test pressure not less than 1.5 times the design pressure. Specific requirements are laid down for certain substances in the applicable portable tank instruction indicated in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column 11 of the Dangerous Goods List and described in 4.2.5.3. Attention is drawn to the minimum shell thickness requirements for these tanks specified in 6.7.2.4.1 to 6.7.2.4.10.
- 6.7.2.3.3 For metals exhibiting a clearly defined yield point or characterised by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress  $\sigma$  (sigma) in the shell must not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:
- Re = yield strength in N/mm<sup>2</sup>, or 0.2% proof strength or, for austenitic steels, 1% proof strength;
- Rm = minimum tensile strength in N/mm<sup>2</sup>.
- 6.7.2.3.3.1 The values of Re and Rm to be used must be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used must be approved by the competent authority or its authorised body.
- 6.7.2.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio must be the values specified in the material inspection certificate.
- 6.7.2.3.3.3 Steels used in the construction of shells must have an elongation at fracture, in %, of not less than  $10000/Rm$  with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells must have an elongation at fracture, in %, of not less than  $10000/6Rm$  with an absolute minimum of 12%.
- 6.7.2.3.3.4 For the purpose of determining actual values for materials, it must be noted that for sheet metal, the axis of the tensile test specimen must be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture must be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.
- 6.7.2.4 Minimum shell thickness**
- 6.7.2.4.1 The minimum shell thickness must be the greater thickness based on:
- (a) The minimum thickness determined in accordance with the requirements of 6.7.2.4.2 to 6.7.2.4.10;

- (b) The minimum thickness determined in accordance with the recognised pressure vessel code including the requirements in 6.7.2.3; and
- (c) The minimum thickness specified in the applicable portable tank instruction indicated in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6, or by a portable tank special provision indicated in Column 11 of the Dangerous Goods List and described in 4.2.5.3.

- 6.7.2.4.2 The cylindrical portions, ends (heads) and manhole covers of shells not more than 1.80 m in diameter must be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter must be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used, except that for powdered or granular solid substances of packing group II or III the minimum thickness requirement may be reduced to not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.2.4.3 When additional protection against shell damage is provided, portable tanks with test pressures less than 2.65 bar, may have the minimum shell thickness reduced, in proportion to the protection provided, as approved by the competent authority. However, shells not more than 1.80 m in diameter must be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter must be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.2.4.4 The cylindrical portions, ends (heads) and manhole covers of all shells must be not less than 3 mm thick regardless of the material of construction.
- 6.7.2.4.5 The additional protection referred to in 6.7.2.4.3 may be provided by overall external structural protection, such as suitable “sandwich” construction with the outer sheathing (jacket) secured to the shell, double wall construction or by enclosing the shell in a complete framework with longitudinal and transverse structural members.
- 6.7.2.4.6 The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.2.4.3 must be determined using the following formula:

$$e_1 = \frac{21.4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:  $e_1$  = required equivalent thickness (in mm) of the metal to be used;

$e_0$  = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6 or by a port-

able tank special provision indicated in Column 11 of the Dangerous Goods List and described in 4.2.5.3;

$Rm^1$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the metal to be used (see 6.7.2.3.3);

$A^1$  = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

6.7.2.4.7

When in the applicable portable tank instruction in 4.2.5.2.6, a minimum thickness of 8 mm or 10 mm is specified, it must be noted that these thicknesses are based on the properties of the reference steel and a shell diameter of 1.80 m. When a metal other than mild steel (see 6.7.2.1) is used or the shell has a diameter of more than 1.80 m, the thickness must be determined using the following formula:

$$e_1 = \frac{21.4e_0d_1}{1.8 \sqrt[3]{Rm_1 \times A_1}}$$

where:  $e^1$  = required equivalent thickness (in mm) of the metal to be used;

$e^0$  = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column 11 of the Dangerous Goods List and described in 4.2.5.3;

$d^1$  = diameter of the shell (in m), but not less than 1.80 m;

$Rm^1$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the metal to be used (see 6.7.2.3.3);

$A^1$  = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

6.7.2.4.8

In no case must the wall thickness be less than that prescribed in 6.7.2.4.2, 6.7.2.4.3 and 6.7.2.4.4. All parts of the shell must have a minimum thickness as determined by 6.7.2.4.2 to 6.7.2.4.4. This thickness must be exclusive of any corrosion allowance.

6.7.2.4.9

When mild steel is used (see 6.7.2.1), calculation using the formula in 6.7.2.4.6 is not required.

6.7.2.4.10

There must be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

## **6.7.2.5**

### **Service equipment**

- 6.7.2.5.1 Service equipment must be so arranged as to be protected against the risk of being wrenched off or damaged during handling and transport. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment must be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating must be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps must be capable of being secured against unintended opening.
- 6.7.2.5.2 All openings in the shell, intended for filling or discharging the portable tank must be fitted with a manually operated stop-valve located as close to the shell as reasonably practicable. Other openings, except for openings leading to venting or pressure-relief devices, must be equipped with either a stop-valve or another suitable means of closure located as close to the shell as reasonably practicable.
- 6.7.2.5.3 All portable tanks must be fitted with a manhole or other inspection openings of a suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior. Compartmented portable tanks must have a manhole or other inspection openings for each compartment.
- 6.7.2.5.4 As far as reasonably practicable, external fittings must be grouped together. For insulated portable tanks, top fittings must be surrounded by a spill collection reservoir with suitable drains.
- 6.7.2.5.5 Each connection to a portable tank must be clearly marked to indicate its function.
- 6.7.2.5.6 Each stop-valve or other means of closure must be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during transport. All stop-valves with screwed spindles must close by a clockwise motion of the hand-wheel. For other stop-valves the position (open and closed) and direction of closure must be clearly indicated. All stop-valves must be designed to prevent unintentional opening.
- 6.7.2.5.7 No moving parts, such as covers, components of closures, etc., must be made of unprotected corrodible steel when they are liable to come into frictional or percussive contact with aluminium portable tanks intended for the transport of substances meeting the flash point criteria of Class 3 including elevated temperature substances transported at or above their flash point.
- 6.7.2.5.8 Piping must be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping must be of a suitable metallic material. Welded pipe joints must be used wherever possible.

- 6.7.2.5.9 Joints in copper tubing must be brazed or have an equally strong metal union. The melting point of brazing materials must be no lower than 525 °C. The joints must not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.2.5.10 The burst pressure of all piping and pipe fittings must be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.2.5.11 Ductile metals must be used in the construction of valves and accessories.
- 6.7.2.5.12 The heating system must be designed or controlled so that a substance cannot reach a temperature at which the pressure in the tank exceeds its MAWP or causes other hazards (e.g. dangerous thermal decomposition).
- 6.7.2.5.13 The heating system must be designed or controlled so that power for internal heating elements must not be available unless the heating elements are completely submerged. The temperature at the surface of the heating elements for internal heating equipment, or the temperature at the shell for external heating equipment must, in no case, exceed 80% of the autoignition temperature (in °C) of the substance transported.
- 6.7.2.5.14 If an electrical heating system is installed inside the tank, it must be equipped with an earth leakage circuit breaker with a releasing current of less than 100 mA.
- 6.7.2.5.15 Electrical switch cabinets mounted to tanks must not have a direct connection to the tank interior and must provide protection of at least the equivalent of type IP56 according to IEC 144 or IEC 529.

## **6.7.2.6 Bottom openings**

- 6.7.2.6.1 Certain substances must not be transported in portable tanks with bottom openings. When the applicable portable tank instruction identified in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6 indicates that bottom openings are prohibited there must be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit. When an existing opening is closed it must be accomplished by internally and externally welding one plate to the shell.
- 6.7.2.6.2 Bottom discharge outlets for portable tanks carrying certain solid, crystallisable or highly viscous substances must be equipped with not less than two serially fitted and mutually independent shut-off devices. The design of the equipment must be to the satisfaction of the competent authority or its authorised body and must include:
- (a) An external stop-valve, fitted as close to the shell as reasonably practicable, and so designed as to prevent any unintended opening through impact or other inadvertent act; and
  - (b) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.

- 6.7.2.6.3 Every bottom discharge outlet, except as provided in 6.7.2.6.2, must be equipped with three serially fitted and mutually independent shut-off devices. The design of the equipment must be to the satisfaction of the competent authority or its authorised body and include:
- (a) A self-closing internal stop-valve, that is a stop-valve within the shell or within a welded flange or its companion flange, such that:
    - (i) The control devices for the operation of the valve are designed so as to prevent any unintended opening through impact or other inadvertent act;
    - (ii) The valve may be operable from above or below;
    - (iii) If possible, the setting of the valve (open or closed) must be capable of being verified from the ground;
    - (iv) Except for portable tanks having a capacity of not more than 1,000 litres, it must be possible to close the valve from an accessible position of the portable tank that is remote from the valve itself; and
    - (v) The valve must continue to be effective in the event of damage to the external device for controlling the operation of the valve;
  - (b) An external stop-valve fitted as close to the shell as reasonably practicable; and
  - (c) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.
- 6.7.2.6.4 For a lined shell, the internal stop-valve required by 6.7.2.6.3(a) may be replaced by an additional external stop-valve. The manufacturer must satisfy the requirements of the competent authority or its authorised body.
- 6.7.2.7 Safety relief devices**
- 6.7.2.7.1 All portable tanks must be fitted with at least one pressure-relief device. All relief devices must be designed, constructed and marked to the satisfaction of the competent authority or its authorised body.
- 6.7.2.8 Pressure-relief devices**
- 6.7.2.8.1 Every portable tank with a capacity not less than 1,900 litres and every independent compartment of a portable tank with a similar capacity, must be provided with one or more pressure-relief devices of the spring-loaded type and may in addition have a frangible disc or fusible element in parallel with the spring-loaded devices except when prohibited by reference to 6.7.2.8.3 in the applicable portable tank instruction in 4.2.5.2.6. The pressure-relief devices must have sufficient capacity to prevent rupture of the shell due to over pressurisation or vacuum resulting from filling, discharging, or from heating of the contents.
- 6.7.2.8.2 Pressure-relief devices must be designed to prevent the entry of foreign matter, the leakage of liquid and the development of any dangerous excess pressure.

- 6.7.2.8.3 When required for certain substances by the applicable portable tank instruction identified in Column 10 of the Dangerous Goods List and described in 4.2.5.2.6, portable tanks must have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the load, the relief device must comprise a frangible disc preceding a spring-loaded pressure-relief device. When a frangible disc is inserted in series with the required pressure-relief device, the space between the frangible disc and the pressure-relief device must be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing, or leakage which could cause a malfunction of the pressure-relief system. The frangible disc must rupture at a nominal pressure 10% above the start to discharge pressure of the relief device.
- 6.7.2.8.4 Every portable tank with a capacity less than 1,900 litres must be fitted with a pressure-relief device which may be a frangible disc when this disc complies with the requirements of 6.7.2.11.1. When no spring-loaded pressure-relief device is used, the frangible disc must be set to rupture at a nominal pressure equal to the test pressure. In addition, fusible elements conforming to 6.7.2.10.1 may also be used.
- 6.7.2.8.5 When the shell is fitted for pressure discharge, the inlet line must be provided with a suitable pressure-relief device set to operate at a pressure not higher than the MAWP of the shell, and a stop-valve must be fitted as close to the shell as reasonably practicable.
- 6.7.2.9 Setting of pressure-relief devices**
- 6.7.2.9.1 It must be noted that the pressure-relief devices must operate only in conditions of excessive rise in temperature, since the shell must not be subject to undue fluctuations of pressure during normal conditions of transport (see 6.7.2.12.2).
- 6.7.2.9.2 Except where 6.7.2.9.3 applies, the required pressure-relief device must be set to start-to-discharge at a nominal pressure of five-sixths of the test pressure for shells having a test pressure of not more than 4.5 bar and 110% of two-thirds of the test pressure for shells having a test pressure of more than 4.5 bar. After discharge the device must close at a pressure not more than 10% below the pressure at which the discharge starts. The device must remain closed at all lower pressures. This requirement does not prevent the use of vacuum-relief or combination pressure-relief and vacuum-relief devices.
- 6.7.2.9.3 Where required by legislation governing the design and use of pressure vessels in the jurisdiction, the settings for pressure relief devices must comply with those specified in AS 1210 rather than 6.7.2.9.2.

## **6.7.2.10**

### **Fusible elements**

#### **6.7.2.10.1**

Fusible elements must operate at a temperature between 100 °C and 149 °C on condition that the pressure in the shell at the fusing temperature will be not more than the test pressure. They must be placed at the top of the shell with their inlets in the vapour space and when used for transport safety purposes, they must not be shielded from external heat.

Fusible elements must not be used on portable tanks with a test pressure which exceeds 2.65 bar unless specified by special provision TP36 in Column 11 of the Dangerous Goods List of Chapter 3.2. Fusible elements used on portable tanks intended for the transport of elevated temperature substances must be designed to operate at a temperature higher than the maximum temperature that will be experienced during transport and must be to the satisfaction of the competent authority or its authorised body.

## **6.7.2.11**

### **Frangible discs**

#### **6.7.2.11.1**

Except as specified in 6.7.2.8.3, frangible discs must be set to rupture at a nominal pressure equal to the test pressure throughout the design temperature range. Particular attention must be given to the requirements of 6.7.2.5.1 and 6.7.2.8.3 if frangible discs are used.

#### **6.7.2.11.2**

Frangible discs must be appropriate for the vacuum pressures which may be produced in the portable tank.

## **6.7.2.12**

### **Capacity of pressure-relief devices**

#### **6.7.2.12.1**

The spring-loaded pressure-relief device required by 6.7.2.8.1 must have a minimum cross sectional flow area equivalent to an orifice of 31.75 mm diameter. Vacuum-relief devices, when used, must have a cross sectional flow area not less than 284 mm<sup>2</sup>.

#### **6.7.2.12.2**

The combined delivery capacity of the pressure relief system (taking into account the reduction of the flow when the portable tank is fitted with frangible-discs preceding spring-loaded pressure-relief devices or when the spring-loaded pressure-relief devices are provided with a device to prevent the passage of the flame), in condition of complete fire engulfment of the portable tank must be sufficient to limit the pressure in the shell to 20% above the start-to-discharge pressure of the pressure limiting device. Emergency pressure-relief devices may be used to achieve the full relief capacity prescribed. These devices may be fusible, spring loaded or frangible disc components, or a combination of spring-loaded and frangible disc devices. The total required capacity of the relief devices may be determined using the formula in 6.7.2.12.2.1 or the table in 6.7.2.12.2.3.

##### **6.7.2.12.2.1**

To determine the total required capacity of the relief devices, which must be regarded as being the sum of the individual capacities of all the contributing devices, the following formula must be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m<sup>3</sup>/s) at standard conditions: 1 bar and 0 °C (273 K);

F = is a coefficient with the following value:

for uninsulated shells F = 1;

for insulated shells  $F = U(649 - t)/13.6$

but in no case is less than 0.25 where:

U = thermal conductance of the insulation, in  $kW \times m^{-2} \times K^{-1}$  at 38 °C

t = actual temperature of the substance during filling (in °C);

when this temperature is unknown, let t = 15 °C:

The value of F given above for insulated shells may be taken provided that the insulation is in conformance with 6.7.2.12.2.4;

A = total external surface area of shell in square metres;

Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let Z equal 1.0);

T = absolute temperature in Kelvin (°C + 273) above the pressure-relief devices in the accumulating condition;

L = the latent heat of vaporisation of the liquid, in kJ/kg, in the accumulating condition;

M = molecular mass of the discharged gas;

C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats:

$$k = \frac{c_p}{c_v}$$

where:

c<sub>p</sub> is the specific heat at constant pressure; and

c<sub>v</sub> is the specific heat at constant volume.

When k > 1:

$$C = \sqrt{k \left( \frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

When k = 1, or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183

C may also be taken from the following table:

| k    | C     | k    | C     | k    | C     |
|------|-------|------|-------|------|-------|
| 1.00 | 0.607 | 1.26 | 0.660 | 1.52 | 0.704 |
| 1.02 | 0.611 | 1.28 | 0.664 | 1.54 | 0.707 |
| 1.04 | 0.615 | 1.30 | 0.667 | 1.56 | 0.710 |
| 1.06 | 0.620 | 1.32 | 0.671 | 1.58 | 0.713 |
| 1.08 | 0.624 | 1.34 | 0.674 | 1.60 | 0.716 |
| 1.10 | 0.628 | 1.36 | 0.678 | 1.62 | 0.719 |
| 1.12 | 0.633 | 1.38 | 0.681 | 1.64 | 0.722 |
| 1.14 | 0.637 | 1.40 | 0.685 | 1.66 | 0.725 |
| 1.16 | 0.641 | 1.42 | 0.688 | 1.68 | 0.728 |
| 1.18 | 0.645 | 1.44 | 0.691 | 1.70 | 0.731 |
| 1.20 | 0.649 | 1.46 | 0.695 | 2.00 | 0.770 |
| 1.22 | 0.652 | 1.48 | 0.698 | 2.20 | 0.793 |
| 1.24 | 0.656 | 1.50 | 0.701 |      |       |

#### 6.7.2.12.2.2

As an alternative to the formula above, shells designed for the transport of liquids may have their relief devices sized in accordance with the table in 6.7.2.12.2.3. This table assumes an insulation value of  $F = 1$  and must be adjusted accordingly when the shell is insulated. Other values used in determining this table are:

$M = 86.7$

$T = 394 \text{ K}$

$L = 334.94 \text{ kJ/kg}$

$C = 0.607$

$Z = 1$

#### 6.7.2.12.2.3

Minimum required rate of discharge,  $Q$ , in cubic metres of air per second at 1 bar and  $0^\circ\text{C}$  (273 K).

| 35                                                                  | 2.400                                                                   | 100                                                                 | 5.676                                                                   |

6.7.2.12.2.4

Insulation systems, used for the purpose of reducing venting capacity, must be approved by the competent authority or its authorised body. In all cases, insulation systems approved for this purpose must:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

## 6.7.2.13

### Marking of pressure-relief devices

6.7.2.13.1

Every pressure-relief device must be clearly and permanently marked with the following:

- (a) The pressure (in bar or kPa) or temperature (in °C) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;
- (d) The allowable temperature tolerance for fusible elements;
- (e) The rated flow capacity of the spring-loaded pressure relief devices, frangible discs or fusible elements in standard cubic metres of air per second (m<sup>3</sup>/s); and
- (f) The cross sectional flow areas of the spring loaded pressure-relief devices, frangible discs and fusible elements in mm<sup>2</sup>.

When practicable, the following information must also be shown:

- (g) The manufacturer's name and relevant catalogue number.

6.7.2.13.2

The rated flow capacity marked on the spring-loaded pressure-relief devices must be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

#### **6.7.2.14**

### **Connections to pressure-relief devices**

#### **6.7.2.14.1**

Connections to pressure-relief devices must be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve must be installed between the shell and the pressure-relief devices except where duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always in use. There must be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents or pipes from the pressure-relief device outlets, when used, must deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving devices.

#### **6.7.2.15**

### **Siting of pressure-relief devices**

#### **6.7.2.15.1**

Each pressure-relief device inlet must be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets must under maximum filling conditions be situated in the vapour space of the shell and the devices must be so arranged as to ensure the escaping vapour is discharged unrestrictedly. For flammable substances, the escaping vapour must be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

#### **6.7.2.15.2**

Arrangements must be made to prevent access to the pressure-relief devices by unauthorised persons and to protect the devices from damage caused by the portable tank overturning.

#### **6.7.2.16**

### **Gauging devices**

#### **6.7.2.16.1**

Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the tank must not be used.

#### **6.7.2.17**

### **Portable tank supports, frameworks, lifting and tie-down attachments**

#### **6.7.2.17.1**

Portable tanks must be designed and constructed with a support structure to provide a secure base during transport. The forces specified in 6.7.2.2.12 and the safety factor specified in 6.7.2.2.13 must be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

- 6.7.2.17.2 The combined stresses caused by portable tank mountings (e.g. cradles, framework, etc.) and portable tank lifting and tie-down attachments must not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments must be fitted to all portable tanks. Preferably they must be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.
- 6.7.2.17.3 In the design of supports and frameworks the effects of environmental corrosion must be taken into account.
- 6.7.2.17.4 Forklift pockets must be capable of being closed off. The means of closing forklift pockets must be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:
- (a) The shell including all the fittings are well protected from being hit by the forklift blades; and
  - (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.
- 6.7.2.17.5 When portable tanks are not protected during transport, according to 4.2.1.2, the shells and service equipment must be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings must be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:
- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
  - (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
  - (c) Protection against rear impact which may consist of a bumper or frame;
  - (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

## 6.7.2.18

### Design approval

#### 6.7.2.18.1

The competent authority or its authorised body may issue a design approval certificate for any new design of a portable tank. This certificate must attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this chapter and where appropriate, the provisions for substances provided in chapter 4.2 and in the Dangerous Goods List in chapter 3.2. When a series of portable tanks are manufactured without change in the design, the certificate must be valid for the entire series. The certificate must refer to the prototype test report, the substances or group of substances allowed to be transported, the materials of construction of the shell and lining (when applicable) and an approval number. The approval number must consist of the distinguishing sign or mark of the State in whose territory the approval was granted, indicated by the distinguishing sign used on vehicles in international road traffic<sup>1</sup> (for Australia, the letters 'AUS'), and a registration number. Any alternative arrangements according to 6.7.1.2 must be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

#### 6.7.2.18.2

The prototype test report for the design approval must include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.2.19.3; and
- (c) The results of the impact test in 6.7.2.19.1, when applicable.

## 6.7.2.19

### Inspection and testing

#### 6.7.2.19.1

Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, must not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual for Tests and Criteria, part IV, section 41.

#### 6.7.2.19.2

The shell and items of equipment of each portable tank must be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test must be performed regardless of the date of the last periodic inspection and test when necessary according to 6.7.2.19.7.

---

<sup>1</sup> Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

- 6.7.2.19.3 The initial inspection and test of a portable tank must include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the substances to be transported, and a pressure test. Before the portable tank is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment must also be performed. When the shell and its fittings have been pressure-tested separately, they must be subjected together after assembly to a leakproofness test.
- 6.7.2.19.4 The 5-year periodic inspection and test must include an internal and external examination and, as a general rule, a hydraulic pressure test. For tanks only used for the transport of solid substances, other than toxic or corrosive substances that do not liquefy during transport, the hydraulic pressure test may be replaced by a suitable pressure test at 1.5 times the MAWP, subject to competent authority exemption. Sheathing, thermal insulation and the like must be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they must also be subjected to a leakproofness test together after assembly.
- 6.7.2.19.5 The intermediate 2.5 year periodic inspection and test must at least include an internal and external examination of the portable tank and its fittings with due regard to the substances intended to be transported, a leakproofness test and a test of the satisfactory operation of all service equipment. Sheathing, thermal insulation and the like must be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks dedicated to the transport of a single substance, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorised body.
- 6.7.2.19.6 A portable tank may not be filled and offered for transport after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.2.19.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be transported for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be transported after the date of expiry of the last periodic test and inspection:
- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
  - (b) Unless otherwise exempted by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption must be mentioned in the transport document.
- 6.7.2.19.6.1 Except as provided for in 6.7.2.19.6, portable tanks which have missed the timeframe for their scheduled 5 year or 2.5 year periodic inspection and test may only be filled and offered for transport if a new 5 year periodic inspection and test is performed according to 6.7.2.19.4

- 6.7.2.19.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test must depend on the amount of damage or deterioration of the portable tank. It must include at least the 2.5 year inspection and test according to 6.7.2.19.5.
- 6.7.2.19.8 The internal and external examinations must ensure that:
- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for transport. The wall thickness shall be verified by appropriate measurement if this inspection indicates a reduction of wall thickness;
  - (b) The piping, valves, heating/cooling system, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or transport;
  - (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
  - (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves must be operated to demonstrate proper operation;
  - (f) Linings, if any, are inspected in accordance with criteria outlined by the lining manufacturer;
  - (g) Required marks on the portable tank are legible and in accordance with the applicable requirements; and
  - (h) The framework, supports and arrangements for lifting the portable tank are in a satisfactory condition.
- 6.7.2.19.9 The inspections and tests in 6.7.2.19.1, 6.7.2.19.3, 6.7.2.19.4, 6.7.2.19.5 and 6.7.2.19.7 must be performed or witnessed by an expert recognised by the competent authority or its authorised body. When the pressure test is a part of the inspection and test, the test pressure must be the one indicated on the data plate of the portable tank. While under pressure, the portable tank must be inspected for any leaks in the shell, piping or equipment.
- 6.7.2.19.10 In all cases when cutting, burning or welding operations on the shell have been effected, that work must be to the approval of the competent authority or its authorised body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure must be performed after the work is completed.
- 6.7.2.19.11 When evidence of any unsafe condition is discovered, the portable tank must not be returned to service until it has been corrected and the test is repeated and passed.

## 6.7.2.20

## Marking

### 6.7.2.20.1

Every portable tank must be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell must be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information must be marked on the plate by stamping or by any other similar method:

(a) Owner information

- (i) Owner's registration number;

(b) Manufacturing information

- (i) Country of manufacture;
- (ii) Year of manufacture;
- (iii) Manufacturer's name or mark;
- (iv) Manufacturer's serial number;

(c) Approval information

- (i) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;

- (ii) Approval country;
- (iii) Authorised body for the design approval;
- (iv) Design approval number;
- (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
- (vi) Pressure vessel code to which the shell is designed;

(d) Pressures

- (i) MAWP (in bar gauge or kPa gauge)<sup>1</sup>;
- (ii) Test pressure (in bar gauge or kPa gauge)<sup>1</sup>;
- (iii) Initial pressure test date (month and year);
- (iv) Identification mark of the initial pressure test witness;
- (v) External design pressure<sup>2</sup> (in bar gauge or kPa gauge)<sup>1</sup>;
- (vi) MAWP for heating/cooling system (in bar gauge or kPa gauge)<sup>1</sup> (when applicable);

(e) Temperatures

- (i) Design temperature range (in °C)<sup>1</sup>;

(f) Materials

- (i) Shell material(s) and material standard reference(s);
- (ii) Equivalent thickness in reference steel (in mm)<sup>3</sup>;

---

<sup>1</sup>The unit used must be indicated.

<sup>2</sup>See 6.7.2.2.10

<sup>3</sup>The unit used must be indicated.

- (iii) Lining material (when applicable);
- (g) Capacity
  - (i) Tank water capacity at 20 °C (in litres)<sup>1</sup>;  
This indication is to be followed by the symbol "S" when the shell is divided by surge plates into sections of not more than 7 500 litres capacity;
  - (ii) Water capacity of each compartment at 20 °C (in litres)<sup>1</sup> (when applicable, for multi-compartment tanks).  
This indication is to be followed by the symbol "S" when the compartment is divided by surge plates into sections of not more than 7 500 litres capacity;
- (h) Periodic inspections and tests
  - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
  - (ii) Date of the most recent periodic test (month and year);
  - (iii) Test pressure (in bar gauge or kPa gauge)<sup>1</sup> of the most recent periodic test (if applicable);
  - (iv) Identification mark of the authorised body who performed or witnessed the most recent test.

| Design temperature range                                                                   |           |                                              |            | °C        |           | to °C                                        |            |
| MATERIALS                                                                                  |           |                                              |            |           |           |                                              |            |
| Shell material(s) and material standard reference(s)                                       |           |                                              |            |           |           |                                              |            |
| Equivalent thickness in reference steel                                                    |           |                                              |            | mm        |           |                                              |            |
| Lining material (when applicable)                                                          |           |                                              |            |           |           |                                              |            |
| CAPACITY                                                                                   |           |                                              |            |           |           |                                              |            |
| Tank water capacity at 20 °C                                                               |           |                                              |            | litres    |           | 'S' (if applicable)                          |            |
| Water capacity of compartment ____ at 20 °C (when applicable, for multi-compartment tanks) |           |                                              |            | litres    |           | 'S' (if applicable)                          |            |
|                                                                                            |           |                                              |            |           |           |                                              |            |
| PERIODIC INSPECTIONS / TESTS                                                               |           |                                              |            |           |           |                                              |            |
| Test type                                                                                  | Test date | Witness stamp and test pressure <sup>a</sup> |            | Test type | Test date | Witness stamp and test pressure <sup>a</sup> |            |
|                                                                                            | (mm/yyyy) |                                              | bar or kPa |           | (mm/yyyy) |                                              | bar or kPa |
|                                                                                            |           |                                              |            |           |           |                                              |            |
|                                                                                            |           |                                              |            |           |           |                                              |            |

Table note:

a Test pressure if applicable.

6.7.2.20.2 The following information must be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

Portable tank instruction in accordance with 4.2.5.2.6

**NOTE:** For the identification of the substances being transported, see also part 5.

6.7.2.20.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" must be marked on the identification plate.

## 6.7.3 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF PORTABLE TANKS INTENDED FOR THE TRANSPORT OF NON-REFRIGERATED LIQUEFIED GASES

**NOTE:** These requirements also apply to portable tanks intended for the transport of chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505).

### 6.7.3.1 Application and Definitions

#### 6.7.3.1.1 Application

This Section must be applied in conjunction with the legislation applicable in the particular State or Territory to pressure vessels. Where there is conflict, the requirements of that legislation and any Codes and Standards mandated by that legislation take precedence over this Section.

#### 6.7.3.1.2 Definitions

For the purposes of this section:

**Design pressure** means the pressure to be used in calculations required by a recognised pressure vessel code. The design pressure must be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
  - (i) the maximum effective gauge pressure to which the shell is designed as defined in (b) of the MAWP definition (see above); and
  - (ii) a head pressure determined on the basis of the static forces specified in 6.7.3.2.9, but not less than 0.35 bar;

**Design reference temperature** means the temperature at which the vapour pressure of the contents is determined for the purpose of calculating the MAWP. The design reference temperature must be less than the critical temperature of the non-refrigerated liquefied gas or liquefied gas propellants of chemicals under pressure intended to be transported to ensure that the gas at all times is liquefied. This value for each portable tank type is as follows:

- (a) Shell with a diameter of 1.5 metres or less: 65 °C;
- (b) Shell with a diameter of more than 1.5 metres:
  - (i) without insulation or sun shield: 60 °C;
  - (ii) with sun shield (see 6.7.3.2.12): 55 °C; and
  - (iii) with insulation (see 6.7.3.2.12): 50 °C;

**Design temperature range** for the shell must be -40 °C to 50 °C for non-refrigerated liquefied gases transported under ambient conditions. More severe design temperatures must be considered for portable tanks subjected to severe climatic conditions;

**Filling density** means the average mass of non-refrigerated liquefied gas per litre of shell capacity (kg/L). The filling density is given in portable tank instruction T50 in 4.2.5.2.6;

**Leakproofness test** means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

**Maximum allowable working pressure (MAWP)** means a pressure that must be not less than the highest of the following pressures measured at the top of the shell while in operating position, but in no case less than 7 bar:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed, which must be:
  - (i) for a non-refrigerated liquefied gas listed in the portable tank instruction T50 in 4.2.5.2.6, the MAWP (in bar) given in T50 portable tank instruction for that gas;
  - (ii) for other non-refrigerated liquefied gases, not less than the sum of:
    - the absolute vapour pressure (in bar) of the non-refrigerated liquefied gas at the design reference temperature minus 1 bar; and
    - the partial pressure (in bar) of air or other gases in the ullage space being determined by the design reference temperature and the liquid phase expansion due to an increase of the mean bulk temperature of  $t_r - t_f$  ( $t_f$  = filling temperature, usually 15 °C,  $t_r$  = 50 °C maximum mean bulk temperature);
  - (iii) for chemicals under pressure, the MAWP (in bar) given in T50 portable tank instruction for the liquefied gas portion of the propellants listed in T50 in 4.2.5.2.6;

**Maximum permissible gross mass (MPGM)** means the sum of the tare mass of the portable tank and the heaviest load authorised for transport;

**Mild steel** means a steel with a guaranteed minimum tensile strength of 360 N/mm<sup>2</sup> to 440 N/mm<sup>2</sup> and a guaranteed minimum elongation at fracture conforming to 6.7.3.3.3.3;

**Portable tank** means a multimodal tank having a capacity of more than 450 litres used for the transport of non-refrigerated liquefied gases of Class 2. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the transport of gases. The portable tank must be capable of being filled and discharged without the removal of its structural equipment. It must possess stabilising members external to the shell, and must be capable of being lifted when full. It must be designed primarily to be loaded onto a transport vehicle or ship and must be equipped with skids, mountings or accessories to facilitate mechanical handling. Road tank-vehicles, rail tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

**Reference steel** means a steel with a tensile strength of 370 N/mm<sup>2</sup> and an elongation at fracture of 27%;

**Service equipment** means measuring instruments and filling, discharge, venting, safety and insulating devices;

**Shell** means the part of the portable tank which retains the non-refrigerated liquefied gas intended for transport (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

**Structural equipment** means the reinforcing, fastening, protective and stabilising members external to the shell;

**Test pressure** means the maximum gauge pressure at the top of the shell during the pressure test.

## 6.7.3.2

### General design and construction requirements

#### 6.7.3.2.1

Shells must be designed and constructed in accordance with the requirements of a pressure vessel code recognised by the competent authority. Shells must be made of steel suitable for forming. The materials must in principle conform to national or international material standards. For welded shells, only a material whose weldability has been fully demonstrated must be used. Welds must be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells must be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material the design temperature range must be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength must be not more than 460 N/mm<sup>2</sup> and the guaranteed value of the upper limit of the tensile strength must be not more than 725 N/mm<sup>2</sup> according to the material specification. Portable tank materials must be suitable for the external environment in which they may be transported.

#### 6.7.3.2.2

Portable tank shells, fittings and pipework must be constructed of materials which are:

- (a) Substantially immune to attack by the non-refrigerated liquefied gas(es) intended to be transported; or
- (b) Properly passivated or neutralised by chemical reaction.

#### 6.7.3.2.3

Gaskets must be made of materials compatible with the non-refrigerated liquefied gas(es) intended to be transported.

#### 6.7.3.2.4

Contact between dissimilar metals which could result in damage by galvanic action must be avoided.

#### 6.7.3.2.5

The materials of the portable tank, including any devices, gaskets, and accessories, must not adversely affect the non-refrigerated liquefied gas(es) intended for transport in the portable tank.

#### 6.7.3.2.6

Portable tanks must be designed and constructed with supports to provide a secure base during transport and with suitable lifting and tie-down attachments.

- 6.7.3.2.7 Portable tanks must be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and transport. The design must demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.3.2.8 Shells must be designed to withstand an external pressure of at least 0.4 bar gauge above the internal pressure without permanent deformation. When the shell is to be subjected to a significant vacuum before filling or during discharge it must be designed to withstand an external pressure of at least 0.9 bar gauge above the internal pressure and must be proven at that pressure.
- 6.7.3.2.9 Portable tanks and their fastenings must, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces must be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>; and
  - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>.
- 6.7.3.2.10 Under each of the forces in 6.7.3.2.9, the safety factor to be observed must be as follows:
- (a) For steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
  - (b) For steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.3.2.11 The values of yield strength or proof strength must be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength and proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the value of yield strength or proof strength used must be approved by the competent authority.
- 6.7.3.2.12 When the shells intended for the transport of non-refrigerated liquefied gases are equipped with thermal insulation, the thermal insulation systems must satisfy the following requirements:
- (a) It must consist of a shield covering not less than the upper third but not more than the upper half of the surface of the shell and

---

<sup>1</sup>For calculation purposes  $g = 9.81 \text{ m/s}^2$

- separated from the shell by an air space about 40 mm across; or
- (b) It must consist of a complete cladding of adequate thickness of insulating materials protected so as to prevent the ingress of moisture and damage under normal conditions of transport and so as to provide a thermal conductance of not more than  $0.67 \text{ (W} \times \text{m}^{-2} \times \text{K}^{-1})$ ;
- (c) When the protective covering is so closed as to be gas-tight, a device must be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas tightness of the shell or of its items of equipment;
- (d) The thermal insulation must not inhibit access to the fittings and discharge devices.

6.7.3.2.13 Portable tanks intended for the transport of flammable non-refrigerated liquefied gases must be capable of being electrically earthed.

### 6.7.3.3 Design criteria

6.7.3.3.1 Shells must be of a circular cross-section.

6.7.3.3.2 Shells must be designed and constructed to withstand a test pressure not less than 1.3 times the design pressure. The shell design must take into account the minimum MAWP values provided in portable tank instruction T50 in 4.2.5.2.6 for each non-refrigerated liquefied gas intended for transport. Attention is drawn to the minimum shell thickness requirements for these shells specified in 6.7.3.4.

6.7.3.3.3 For steels exhibiting a clearly defined yield point or characterised by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress  $\sigma$  (sigma) in the shell must not exceed  $0.75 R_e$  or  $0.50 R_m$ , whichever is lower, at the test pressure, where:

$R_e$  = yield strength in  $\text{N/mm}^2$ , or 0.2% proof strength or, for austenitic steels, 1% proof strength;

$R_m$  = minimum tensile strength in  $\text{N/mm}^2$ .

6.7.3.3.3.1 The values of  $R_e$  and  $R_m$  to be used must be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for  $R_e$  and  $R_m$  according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the values of  $R_e$  and  $R_m$  used must be approved by the competent authority or its authorised body.

6.7.3.3.3.2 Steels which have an  $R_e/R_m$  ratio of more than 0.85 are not allowed for the construction of welded shells. The values of  $R_e$  and  $R_m$  to be used in determining this ratio must be the values specified in the material inspection certificate.

6.7.3.3.3.3 Steels used in the construction of shells must have an elongation at fracture, in %, of not less than  $10\,000/R_m$  with an absolute minimum of 16% for fine grain steels and 20% for other steels.

6.7.3.3.3.4 For the purpose of determining actual values for materials, it must be noted that for sheet metal, the axis of the tensile test specimen must be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture must be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.

#### 6.7.3.4 Minimum shell thickness

6.7.3.4.1 The minimum shell thickness must be the greater thickness based on:

- (a) The minimum thickness determined in accordance with the requirements in 6.7.3.4; and
- (b) The minimum thickness determined in accordance with the recognised pressure vessel code including the requirements in 6.7.3.3.

In addition, any relevant portable tank special provision indicated in Column 11 of the Dangerous Goods List and described in 4.2.5.3 shall be taken into account.

6.7.3.4.2 The cylindrical portions, ends (heads) and manhole covers of shells of not more than 1.80 m in diameter must be not less than 5 mm thick in the reference steel or of equivalent thickness in the steel to be used. Shells of more than 1.80 m in diameter must be not less than 6 mm thick in the reference steel or of equivalent thickness in the steel to be used.

6.7.3.4.3 The cylindrical portions, ends (heads) and manhole covers of all shells must be not less than 4 mm thick regardless of the material of construction.

6.7.3.4.4 The equivalent thickness of a steel other than the thickness prescribed for the reference steel in 6.7.3.4.2 must be determined using the following formula:

$$e_1 = \frac{21.4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

$e_1$  = required equivalent thickness (in mm) of the steel to be used;

$e_0$  = minimum thickness (in mm) for the reference steel specified in 6.7.3.4.2;

$Rm_1$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the steel to be used (see 6.7.3.3.3);

$A_1$  = guaranteed minimum elongation at fracture (in %) of the steel to be used according to national or international standards.

6.7.3.4.5 In no case must the wall thickness be less than that prescribed in 6.7.3.4.1 to 6.7.3.4.3. All parts of the shell must have a minimum thickness as determined by 6.7.3.4.1 to 6.7.3.4.3. This thickness must be exclusive of any corrosion allowance.

- 6.7.3.4.6 When mild steel is used (see 6.7.3.1), calculation using the formula in 6.7.3.4.4 is not required.
- 6.7.3.4.7 There must be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

### **6.7.3.5 Service equipment**

- 6.7.3.5.1 Service equipment must be so arranged as to be protected against the risk of being wrenched off or damaged during handling and transport. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment must be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating must be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps must be capable of being secured against unintended opening.
- 6.7.3.5.2 All openings with a diameter of more than 1.5 mm in shells of portable tanks, except openings for pressure-relief devices, inspection openings and closed bleed holes, must be fitted with at least three mutually independent shut-off devices in series, the first being an internal stop-valve, excess flow valve or equivalent device, the second being an external stop-valve and the third being a blank flange or equivalent device.
- 6.7.3.5.2.1 When a portable tank is fitted with an excess flow valve the excess flow valve must be so fitted that its seating is inside the shell or inside a welded flange or, when fitted externally, its mountings must be designed so that in the event of impact its effectiveness must be maintained. The excess flow valves must be selected and fitted so as to close automatically when the rated flow specified by the manufacturer is reached. Connections and accessories leading to or from such a valve must have a capacity for a flow more than the rated flow of the excess flow valve.
- 6.7.3.5.3 For filling and discharge openings the first shut-off device must be an internal stop-valve and the second must be a stop-valve placed in an accessible position on each discharge and filling pipe.
- 6.7.3.5.4 For filling and discharge bottom openings of portable tanks intended for the transport of flammable and/or toxic non-refrigerated liquefied gases or chemicals under pressure the internal stop-valve must be a quick closing safety device which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. Except for portable tanks having a capacity of not more than 1 000 litres, it must be possible to operate this device by remote control.
- 6.7.3.5.5 In addition to filling, discharge and gas pressure equalising orifices, shells may have openings in which gauges, thermometers and manometers can be fitted. Connections for such instruments must be made by suitable welded nozzles or pockets and not be screwed connections through the shell.

- 6.7.3.5.6 All portable tanks must be fitted with manholes or other inspection openings of suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior.
- 6.7.3.5.7 External fittings must be grouped together so far as reasonably practicable.
- 6.7.3.5.8 Each connection on a portable tank must be clearly marked to indicate its function.
- 6.7.3.5.9 Each stop-valve or other means of closure must be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during transport. All stop-valves with a screwed spindle must close by a clockwise motion of the hand-wheel. For other stop-valves the position (open and closed) and direction of closure must be clearly indicated. All stop-valves must be designed to prevent unintentional opening.
- 6.7.3.5.10 Piping must be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping must be of suitable metallic material. Welded pipe joints must be used wherever possible.
- 6.7.3.5.11 Joints in copper tubing must be brazed or have an equally strong metal union. The melting point of brazing materials must be no lower than 525 °C. The joints must not decrease the strength of tubing as may happen when cutting threads.
- 6.7.3.5.12 The burst pressure of all piping and pipe fittings must be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.3.5.13 Ductile metals must be used in the construction of valves and accessories.

### **6.7.3.6 Bottom openings**

- 6.7.3.6.1 Certain non-refrigerated liquefied gases must not be transported in portable tanks with bottom openings. When portable tank instruction T50 in 4.2.5.2.6 indicates that bottom openings are not allowed, there must be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit.

### **6.7.3.7 Pressure-relief devices**

- 6.7.3.7.1 Portable tanks must be provided with one or more spring-loaded pressure-relief devices. The pressure-relief devices must open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices must, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and must remain closed at all lower pressures. The pressure-relief devices must be of a type that will resist dynamic forces including liquid surge. Frangible discs not in series with a spring-loaded pressure-relief device are not permitted.

- 6.7.3.7.2 Pressure-relief devices must be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.3.7.3 Portable tanks intended for the transport of certain non-refrigerated liquefied gases identified in portable tank instruction T50 in 4.2.5.2.6 must have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the load, such device must comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the device must be provided with a pressure gauge or a suitable tell-tale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure-relief device. The frangible discs must rupture at a nominal pressure 10% above the start-to-discharge pressure of the relief device.
- 6.7.3.7.4 In the case of multi-purpose portable tanks, the pressure-relief devices must open at a pressure indicated in 6.7.3.7.1 for the gas having the highest maximum allowable pressure of the gases allowed to be transported in the portable tank.

### 6.7.3.8 Capacity of relief devices

- 6.7.3.8.1 The combined delivery capacity of the relief devices must be sufficient that, in the event of total fire engulfment, the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP. Spring-loaded relief devices must be used to achieve the full relief capacity prescribed. In the case of multi-purpose tanks, the combined delivery capacity of the pressure-relief devices must be taken for the gas which requires the highest delivery capacity of the gases allowed to be transported in portable tanks.
- 6.7.3.8.1.1 To determine the total required capacity of the relief devices, which must be regarded as being the sum of the individual capacities of the several devices, the following formula must be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m<sup>3</sup>/s) at standard conditions: 1 bar and 0°C (273 K);

F = is a coefficient with the following value:

for uninsulated shells F = 1;

for insulated shells F = U(649-t)/13.6;

but in no case is less than 0.25 where.

U = heat transfer coefficient of the insulation, in kW × m<sup>-2</sup> × K<sup>-1</sup>, at 38 °C;

t = actual temperature of the non-refrigerated liquefied gas during filling (°C); when this temperature is unknown, let t=15 °C.

The value of F given above for insulated shells may be taken provided that the insulation is in conformance with 6.7.3.8.1.2;

A = total external surface area of shell in square metres;

Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let Z equal 1.0);

T = absolute temperature in Kelvin (°C + 273) above the pressure-relief devices in the accumulating condition;

L = the latent heat of vaporisation of the liquid, in kJ/kg, in the accumulating condition;

M = molecular mass of the discharged gas;

C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats.

$$k = \frac{C_p}{C_v}$$

where:

c<sub>p</sub> is the specific heat at constant pressure; and

c<sub>v</sub> is the specific heat at constant volume.

When k > 1:

$$C = \sqrt{k \left( \frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

When k = 1, or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183

C may also be taken from the following table:

| k    | C     | k    | C     | k    | C     |
|------|-------|------|-------|------|-------|
| 1.00 | 0.607 | 1.26 | 0.660 | 1.52 | 0.704 |
| 1.02 | 0.611 | 1.28 | 0.664 | 1.54 | 0.707 |
| 1.04 | 0.615 | 1.30 | 0.667 | 1.56 | 0.710 |
| 1.06 | 0.620 | 1.32 | 0.671 | 1.58 | 0.713 |
| 1.08 | 0.624 | 1.34 | 0.674 | 1.60 | 0.716 |
| 1.10 | 0.628 | 1.36 | 0.678 | 1.62 | 0.719 |
| 1.12 | 0.633 | 1.38 | 0.681 | 1.64 | 0.722 |
| 1.14 | 0.637 | 1.40 | 0.685 | 1.66 | 0.725 |
| 1.16 | 0.641 | 1.42 | 0.688 | 1.68 | 0.728 |
| 1.18 | 0.645 | 1.44 | 0.691 | 1.70 | 0.731 |
| 1.20 | 0.649 | 1.46 | 0.695 | 2.00 | 0.770 |
| 1.22 | 0.652 | 1.48 | 0.698 | 2.20 | 0.793 |

|      |       |      |       |  |  |
|------|-------|------|-------|--|--|
| 1.24 | 0.656 | 1.50 | 0.701 |  |  |
|------|-------|------|-------|--|--|

**NOTE:** This formula applies only to non-refrigerated liquefied gases which have critical temperatures well above the temperature at the accumulating condition. For gases which have critical temperatures near or below the temperature at the accumulating condition, the calculation of the pressure-relief device delivery capacity must consider further thermodynamic properties of the gas (see, e.g. CGA S-1.2-2003 "Pressure Relief Device Standards-Part 2-Cargo and Portable Tanks for Compressed Gases").

6.7.3.8.1.2

Insulation systems, used for the purpose of reducing the venting capacity, must be approved by the competent authority or its authorised body. In all cases, insulation systems approved for this purpose must:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

## 6.7.3.9

### Marking of pressure-relief devices

6.7.3.9.1

Every pressure-relief device must be plainly and permanently marked with the following:

- (a) The pressure (in bar or kPa) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;
- (d) The rated flow capacity of the device in standard cubic metres of air per second (m<sup>3</sup>/s); and
- (e) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm<sup>2</sup>.

When practicable, the following information must also be shown:

- (f) The manufacturer's name and relevant catalogue number.

6.7.3.9.2

The rated flow capacity marked on the pressure-relief devices must be determined according to ISO 4126 1:2004 and ISO 4126-7:2004.

### **6.7.3.10**

#### **Connections to pressure-relief devices**

##### **6.7.3.10.1**

Connections to pressure-relief devices must be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve must be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.3.8. There must be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents from the pressure-relief devices, when used, must deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

### **6.7.3.11**

#### **Siting of pressure-relief devices**

##### **6.7.3.11.1**

Each pressure-relief device inlet must be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure relief device inlets must under maximum filling conditions be situated in the vapour space of the shell and the devices must be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For flammable non-refrigerated liquefied gases, the escaping vapour must be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

##### **6.7.3.11.2**

Arrangements must be made to prevent access to the pressure-relief devices by unauthorised persons and to protect the devices from damage caused by the portable tank overturning.

### **6.7.3.12**

#### **Gauging devices**

##### **6.7.3.12.1**

Unless a portable tank is intended to be filled by mass it must be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell must not be used.

### **6.7.3.13**

#### **Portable tank supports, frameworks, lifting and tie-down attachments**

##### **6.7.3.13.1**

Portable tanks must be designed and constructed with a support structure to provide a secure base during transport. The forces specified in 6.7.3.2.9 and the safety factor specified in 6.7.3.2.10 must be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

- 6.7.3.13.2 The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments must not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments must be fitted to all portable tanks. Preferably they must be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.
- 6.7.3.13.3 In the design of supports and frameworks the effects of environmental corrosion must be taken into account.
- 6.7.3.13.4 Forklift pockets must be capable of being closed off. The means of closing forklift pockets must be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:
- (a) The shell and all the fittings are well protected from being hit by the forklift blades; and
  - (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.
- 6.7.3.13.5 When portable tanks are not protected during transport, according to 4.2.2.3, the shells and service equipment must be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings must be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:
- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
  - (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
  - (c) Protection against rear impact which may consist of a bumper or frame;
  - (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

## **6.7.3.14 Design approval**

- 6.7.3.14.1 The competent authority or its authorised body must issue a design approval certificate for any new design of a portable tank. This certificate must attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this chapter and where appropriate the provisions for gases provided in portable tank instruction T50 in 4.2.5.2.6. When a series of portable tanks are manufactured without change in the design, the certificate must be valid for the entire series.
- The certificate must refer to the prototype test report, the gases allowed to be transported, the materials of construction of the shell and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, indicated by the distinguishing sign used on vehicles in

international road traffic<sup>1</sup> (for Australia, the letters 'AUS'), and a registration number. Any alternative arrangements according to 6.7.1.2 must be indicated on the certificate.

A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.3.14.2

The prototype test report for the design approval must include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.3.15.3; and
- (c) The results of the impact test in 6.7.3.15.1, when applicable.

### **6.7.3.15**

#### **Inspection and testing**

6.7.3.15.1

Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, must not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual for Tests and Criteria, part IV, section 41.

6.7.3.15.2

The shell and items of equipment of each portable tank must be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test must be performed regardless of the last periodic inspection and test when necessary according to 6.7.3.15.7.

---

<sup>1</sup>*Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.*

- 6.7.3.15.3 The initial inspection and test of a portable tank must include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases to be transported, and a pressure test referring to the test pressures according to 6.7.3.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorised body. Before the portable tank is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment must also be performed. When the shell and its fittings have been pressure-tested separately, they must be subjected together after assembly to a leakproofness test. All welds subject to full stress level in the shell must be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.
- 6.7.3.15.4 The 5 year periodic inspection and test must include an internal and external examination and, as a general rule, a hydraulic pressure test. Sheathing, thermal insulation and the like must be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they must be subjected together after assembly to a leakproofness test.
- 6.7.3.15.5 The intermediate 2.5 year periodic inspection and test must at least include an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases intended to be transported, a leakproofness test and a test of the satisfactory operation of all service equipment. Sheathing thermal insulation and the like must be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the transport of a single non-refrigerated liquefied gas, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorised body.
- 6.7.3.15.6 A portable tank may not be filled and offered for transport after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.3.15.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be transported for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be transported after the date of expiry of the last periodic test and inspection:
- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
  - (b) Unless otherwise exempted by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption must be mentioned in the transport document.

- 6.7.3.15.6.1 Except as provided for in 6.7.3.15.6, portable tanks which have missed the timeframe for their scheduled 5 year or 2.5 year periodic inspection and test may only be filled and offered for transport if a new 5 year periodic inspection and test is performed according to 6.7.3.15.4
- 6.7.3.15.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test must depend on the amount of damage or deterioration of the portable tank. It must include at least the 2.5 year inspection and test according to 6.7.3.15.5.
- 6.7.3.15.8 The internal and external examinations must ensure that:
- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for transport. The wall thickness must be verified by appropriate measurement if this inspection indicates a reduction in wall thickness;
  - (b) The piping, valves, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or transport;
  - (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
  - (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves must be operated to demonstrate proper operation;
  - (f) Required marks on the portable tank are legible and in accordance with the applicable requirements; and
  - (g) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.
- 6.7.3.15.9 The inspections and tests in 6.7.3.15.1, 6.7.3.15.3, 6.7.3.15.4, 6.7.3.15.5 and 6.7.3.15.7 must be performed or witnessed by an expert recognised by the competent authority or its authorised body. When the pressure test is a part of the inspection and test, the test pressure must be the one indicated on the data plate of the portable tank. While under pressure, the portable tank must be inspected for any leaks in the shell, piping or equipment.
- 6.7.3.15.10 In all cases when cutting, burning or welding operations on the shell have been effected, that work must be to the approval of the competent authority or its authorised body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure must be performed after the work is completed.

6.7.3.15.11

When evidence of any unsafe condition is discovered, the portable tank must not be returned to service until it has been corrected and the pressure test is repeated and passed.

## 6.7.3.16

### Marking

6.7.3.16.1

Every portable tank must be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell must be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information must be marked on the plate by stamping or by any other similar method:

(a) Owner information

- (i) Owner's registration number;

(b) Manufacturing information

- (i) Country of manufacture;
- (ii) Year of manufacture;
- (iii) Manufacturer's name or mark;
- (iv) Manufacturer's serial number;

(c) Approval information

- (i) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;

- (ii) Approval country;
- (iii) Authorised body for the design approval;
- (iv) Design approval number;
- (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
- (vi) Pressure vessel code to which the shell is designed;

(d) Pressures

- (i) MAWP (in bar gauge or kPa gauge)<sup>1</sup>;
- (ii) Test pressure (in bar gauge or kPa gauge)<sup>1</sup>;
- (iii) Initial pressure test date (month and year);
- (iv) Identification mark of the initial pressure test witness;
- (v) External design pressure<sup>2</sup> (in bar gauge or kPa gauge)<sup>1</sup>;

(e) Temperatures

- (i) Design temperature range (in °C)<sup>3</sup>;
- (ii) Design reference temperature (in °C)<sup>1</sup>;

---

<sup>1</sup>The unit used must be indicated.

<sup>2</sup>See 6.7.3.2.8

<sup>3</sup>The unit used must be indicated.

- (f) Materials
  - (i) Shell material(s) and material standard reference(s);
  - (ii) Equivalent thickness in reference steel (in mm)<sup>1</sup>;
- (g) Capacity
  - (i) Tank water capacity at 20 °C (in litres)<sup>1</sup>;
- (h) Periodic inspections and tests
  - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
  - (ii) Date of the most recent periodic test (month and year);
  - (iii) Test pressure (in bar gauge or kPa gauge)<sup>1</sup> of the most recent periodic test (if applicable);
  - (iv) Identification mark of the authorised body who performed or witnessed the most recent test.

**Figure 6.7.3.16.1: Example of a plate for marking**

|                                                                                     |                                     |                |                      |
|-------------------------------------------------------------------------------------|-------------------------------------|----------------|----------------------|
| Owner's registration number                                                         |                                     |                |                      |
| MANUFACTURING INFORMATION                                                           |                                     |                |                      |
| Country of manufacture                                                              |                                     |                |                      |
| Year of manufacture                                                                 |                                     |                |                      |
| Manufacturer                                                                        |                                     |                |                      |
| Manufacturer's serial number                                                        |                                     |                |                      |
| APPROVAL INFORMATION                                                                |                                     |                |                      |
|  | Approval country                    |                |                      |
|                                                                                     | Authorised body for design approval |                |                      |
|                                                                                     | Design approval number              |                | 'AA' (if applicable) |
| Shell design code (pressure vessel code)                                            |                                     |                |                      |
| PRESSURES                                                                           |                                     |                |                      |
| MAWP                                                                                |                                     | bar or kPa     |                      |
| Test pressure                                                                       |                                     | bar or kPa     |                      |
| Initial pressure test date:                                                         | (mm/yyyy)                           | Witness stamp: |                      |
| External design pressure                                                            |                                     | bar or kPa     |                      |
| MAWP for heating/cooling system (when applicable)                                   |                                     | bar or kPa     |                      |
| TEMPERATURES                                                                        |                                     |                |                      |
| Design temperature range                                                            |                                     | °C to          | °C                   |
| Design reference temperature                                                        |                                     | °C to          | °C                   |

|                                                      |           |                                              |            |           |           |                                              |            |
|------------------------------------------------------|-----------|----------------------------------------------|------------|-----------|-----------|----------------------------------------------|------------|
| MATERIALS                                            |           |                                              |            |           |           |                                              |            |
| Shell material(s) and material standard reference(s) |           |                                              |            |           |           |                                              |            |
| Equivalent thickness in reference steel              |           |                                              |            | mm        |           |                                              |            |
| CAPACITY                                             |           |                                              |            |           |           |                                              |            |
| Tank water capacity at 20 °C                         |           |                                              |            | litres    |           | 'S' (if applicable)                          |            |
| PERIODIC INSPECTIONS / TESTS                         |           |                                              |            |           |           |                                              |            |
| Test type                                            | Test date | Witness stamp and test pressure <sup>a</sup> |            | Test type | Test date | Witness stamp and test pressure <sup>a</sup> |            |
|                                                      | (mm/yyyy) |                                              | bar or kPa |           | (mm/yyyy) |                                              | bar or kPa |
|                                                      |           |                                              |            |           |           |                                              |            |
|                                                      |           |                                              |            |           |           |                                              |            |

Table note:

a Test pressure if applicable.

6.7.3.16.2 The following information must be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Name of non-refrigerated liquefied gas(es) permitted for transport

Maximum permissible load mass for each non-refrigerated liquefied gas permitted \_\_\_\_\_ kg

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

Portable tank instruction in accordance with 4.2.5.2.6

**NOTE:** For the identification of the non-refrigerated liquefied gases being transported, see also part 5.

6.7.3.16.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" must be marked on the identification plate.

## 6.7.4 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF PORTABLE TANKS INTENDED FOR THE TRANSPORT OF REFRIGERATED LIQUEFIED GASES

### 6.7.4.1 Application and Definitions

#### 6.7.4.1.1 Application

This Section must be applied in conjunction with the legislation applicable in the particular State or Territory to pressure vessels. Where there

#### 6.7.4.1.2

is conflict, the requirements of that legislation and any Codes and Standards mandated by that legislation take precedence over this Section.

##### Definitions

For the purposes of this section:

**Holding time** means the time that will elapse from the establishment of the initial filling condition until the pressure has risen due to heat influx to the lowest set pressure of the pressure limiting device(s);

**Jacket** means the outer insulation cover or cladding which may be part of the insulation system;

**Leakproofness test** means a test using gas subjecting the shell and its service equipment, to an effective internal pressure not less than 90% of the MAWP;

**Maximum allowable working pressure (MAWP)** means the maximum effective gauge pressure permissible at the top of the shell of a loaded portable tank in its operating position including the highest effective pressure during filling and discharge;

**Maximum permissible gross mass (MPGM)** means the sum of the tare mass of the portable tank and the heaviest load authorised for transport;

**Minimum design temperature** means the temperature which is used for the design and construction of the shell not higher than the lowest (coldest) temperature (service temperature) of the contents during normal conditions of filling, discharge and transport;

**Portable tank** means a thermally insulated multimodal tank having a capacity of more than 450 litres fitted with service equipment and structural equipment necessary for the transport of refrigerated liquefied gases. The portable tank must be capable of being filled and discharged without the removal of its structural equipment. It must possess stabilising members external to the tank, and must be capable of being lifted when full. It must be designed primarily to be loaded onto a transport vehicle or ship and must be equipped with skids, mountings or accessories to facilitate mechanical handling. Road tank-vehicles, rail tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

**Reference steel** means a steel with a tensile strength of 370 N/mm<sup>2</sup> and an elongation at fracture of 27%;

**Shell** means the part of the portable tank which retains the refrigerated liquefied gas intended for transport, including openings and their closures, but does not include service equipment or external structural equipment;

**Service equipment** means measuring instruments and filling, discharge, venting, safety, pressurising, cooling and thermal insulation devices;

**Structural equipment** means the reinforcing, fastening, protective and stabilising members external to the shell;

**Tank** means a construction which normally consists of either:

- (a) A jacket and one or more inner shells where the space between the shell(s) and the jacket is exhausted of air (vacuum insulation) and may incorporate a thermal insulation system; or
- (b) A jacket and an inner shell with an intermediate layer of solid thermally insulating material (e.g. solid foam);

Test pressure means the maximum gauge pressure at the top of the shell during the pressure test.

## 6.7.4.2

### General design and construction requirements

#### 6.7.4.2.1

Shells must be designed and constructed in accordance with the requirements of a pressure vessel code recognised by the competent authority. Shells and jackets must be made of metallic materials suitable for forming. Jackets must be made of steel. Non-metallic materials may be used for the attachments and supports between the shell and jacket, provided their material properties at the minimum design temperature are proven to be sufficient. The materials must in principle conform to national or international material standards. For welded shells and jackets only materials whose weldability has been fully demonstrated must be used. Welds must be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shell must be suitably heat treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the minimum design temperature must be taken into account with respect to risk of brittle fracture, to hydrogen embrittlement, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength must be not more than 460 N/mm<sup>2</sup> and the guaranteed value of the upper limit of the tensile strength must be not more than 725 N/mm<sup>2</sup> in accordance with the material specifications. Portable tank materials must be suitable for the external environment in which they may be transported.

#### 6.7.4.2.2

Any part of a portable tank, including fittings, gaskets and pipe-work, which can be expected normally to come into contact with the refrigerated liquefied gas transported must be compatible with that refrigerated liquefied gas.

#### 6.7.4.2.3

Contact between dissimilar metals which could result in damage by galvanic action must be avoided.

#### 6.7.4.2.4

The thermal insulation system must include a complete covering of the shell(s) with effective insulating materials. External insulation must be protected by a jacket so as to prevent the ingress of moisture and other damage under normal transport conditions.

#### 6.7.4.2.5

When a jacket is so closed as to be gas-tight, a device must be provided to prevent any dangerous pressure from developing in the insulation space.

- 6.7.4.2.6 Portable tanks intended for the transport of refrigerated liquefied gases having a boiling point below minus 182 °C at atmospheric pressure must not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation when there is a risk of contact with oxygen or with oxygen enriched fluid.
- 6.7.4.2.7 Insulating materials must not deteriorate unduly in service.
- 6.7.4.2.8 A reference holding time must be determined for each refrigerated liquefied gas intended for transport in a portable tank.
- 6.7.4.2.8.1 The reference holding time must be determined by a method recognised by the competent authority on the basis of the following:
- (a) The effectiveness of the insulation system, determined in accordance with 6.7.4.2.8.2;
  - (b) The lowest set pressure of the pressure limiting device(s);
  - (c) The initial filling conditions;
  - (d) An assumed ambient temperature of 30 °C;
  - (e) The physical properties of the individual refrigerated liquefied gas intended to be transported.
- 6.7.4.2.8.2 The effectiveness of the insulation system (heat influx in watts) must be determined by type testing the portable tank in accordance with a procedure recognised by the competent authority. This test must consist of either:
- (a) A constant pressure test (for example at atmospheric pressure) when the loss of refrigerated liquefied gas is measured over a period of time; or
  - (b) A closed system test when the rise in pressure in the shell is measured over a period of time.
- When performing the constant pressure test, variations in atmospheric pressure must be taken into account. When performing either tests corrections must be made for any variation of the ambient temperature from the assumed ambient temperature reference value of 30 °C.
- NOTE:** For the determination of the actual holding time before each journey, refer to 4.2.3.7.
- 6.7.4.2.9 The jacket of a vacuum-insulated double-wall tank must have either an external design pressure not less than 100 kPa (1 bar) gauge pressure calculated in accordance with a recognised technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) gauge pressure. Internal and external reinforcements may be included in calculating the ability of the jacket to resist the external pressure.
- 6.7.4.2.10 Portable tanks must be designed and constructed with supports to provide a secure base during transport and with suitable lifting and tie-down attachments.

- 6.7.4.2.11 Portable tanks must be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and transport. The design must demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.4.2.12 Portable tanks and their fastenings under the maximum permissible load must be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces must be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>; and
  - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>.
- 6.7.4.2.13 Under each of the forces in 6.7.4.2.12, the safety factor to be observed must be as follows:
- (a) For materials having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
  - (b) For materials with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength or, for austenitic steels, the 1% proof strength.
- 6.7.4.2.14 The values of yield strength or proof strength must be the values according to national or international material standards. When austenitic steels are used, the specified minimum values according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, or when non-metallic materials are used the values of yield strength or proof strength must be approved by the competent authority.
- 6.7.4.2.15 Portable tanks intended for the transport of flammable refrigerated liquefied gases must be capable of being electrically earthed.
- 6.7.4.3 Design criteria**
- 6.7.4.3.1 Shells must be of a circular cross section.

---

<sup>1</sup>For calculation purposes  $g = 9.81 \text{ m/s}^2$ .

- 6.7.4.3.2 Shells must be designed and constructed to withstand a test pressure not less than 1.3 times the MAWP. For shells with vacuum insulation the test pressure must not be less than 1.3 times the sum of the MAWP and 100 kPa (1 bar). In no case must the test pressure be less than 300 kPa (3 bar) gauge pressure. Attention is drawn to the minimum shell thickness requirements, specified in 6.7.4.4.2 to 6.7.4.4.7.
- 6.7.4.3.3 For metals exhibiting a clearly defined yield point or characterised by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress  $\sigma$  (sigma) in the shell must not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:
- Re = yield strength in N/mm<sup>2</sup>, or 0.2% proof strength or, for austenitic steels, 1% proof strength;
- Rm = minimum tensile strength in N/mm<sup>2</sup>.
- 6.7.4.3.3.1 The values of Re and Rm to be used must be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used must be approved by the competent authority or its authorised body.
- 6.7.4.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio must be the values specified in the material inspection certificate.
- 6.7.4.3.3.3 Steels used in the construction of shells must have an elongation at fracture, in %, of not less than  $10000/Rm$  with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells must have an elongation at fracture, in %, of not less than  $10000/6Rm$  with an absolute minimum of 12%.
- 6.7.4.3.3.4 For the purpose of determining actual values for materials, it must be noted that for sheet metal, the axis of the tensile test specimen must be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture must be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.
- 6.7.4.4 Minimum shell thickness**
- 6.7.4.4.1 The minimum shell thickness must be the greater thickness based on:
- (a) The minimum thickness determined in accordance with the requirements in 6.7.4.4.2 to 6.7.4.4.7; and
  - (b) The minimum thickness determined in accordance with the recognised pressure vessel code including the requirements in 6.7.4.3.

- 6.7.4.4.2 Shells of not more than 1.80 m in diameter must be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells of more than 1.80 m in diameter must be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.3 Shells of vacuum-insulated tanks of not more than 1.80 m in diameter must be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Such shells of more than 1.80 m in diameter must be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.4 For vacuum-insulated tanks, the aggregate thickness of the jacket and the shell must correspond to the minimum thickness prescribed in 6.7.4.4.2, the thickness of the shell itself being not less than the minimum thickness prescribed in 6.7.4.4.3.
- 6.7.4.4.5 Shells must be not less than 3 mm thick regardless of the material of construction.
- 6.7.4.4.6 The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.4.4.2 and 6.7.4.4.3 must be determined using the following formula:

$$e_1 = \frac{21.4 \times e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

$e_1$  = required equivalent thickness (in mm) of the metal to be used;

$e_0$  = minimum thickness (in mm) of the reference steel specified in 6.7.4.4.2 and 6.7.4.4.3;

$Rm_1$  = guaranteed minimum tensile strength (in N/mm<sup>2</sup>) of the metal to be used (see 6.7.4.3.3);

$A_1$  = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

- 6.7.4.4.7 In no case must the wall thickness be less than that prescribed in 6.7.4.4.1 to 6.7.4.4.5. All parts of the shell must have a minimum thickness as determined by 6.7.4.4.1 to 6.7.4.4.6. This thickness must be exclusive of any corrosion allowance.
- 6.7.4.4.8 There must be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

## **6.7.4.5**

### **Service equipment**

#### **6.7.4.5.1**

Service equipment must be so arranged as to be protected against the risk of being wrenched off or damaged during handling and transport. When the connection between the frame and the tank or the jacket and the shell allows relative movement, the equipment must be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the stop-valve and its seating must be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps must be capable of being secured against unintended opening.

#### **6.7.4.5.2**

Each filling and discharge opening in portable tanks used for the transport of flammable refrigerated liquefied gases must be fitted with at least three mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second being a stop-valve and the third being a blank flange or equivalent device.

The shut-off device closest to the jacket must be a quick closing device, which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. This device must also be possible to operate by remote control.

#### **6.7.4.5.3**

Each filling and discharge opening in portable tanks used for the transport of non-flammable refrigerated liquefied gases must be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second a blank flange or equivalent device.

#### **6.7.4.5.4**

For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure relief must be provided to prevent excess pressure build-up within the piping.

#### **6.7.4.5.5**

Vacuum insulated tanks need not have an opening for inspection.

#### **6.7.4.5.6**

External fittings must be grouped together so far as reasonably practicable.

#### **6.7.4.5.7**

Each connection on a portable tank must be clearly marked to indicate its function.

#### **6.7.4.5.8**

Each stop-valve or other means of closure must be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperature expected during transport. All stop-valves with a screwed spindle must be closed by a clockwise motion of the handwheel. In the case of other stop-valves the position (open and closed) and direction of closure must be clearly indicated. All stop-valves must be designed to prevent unintentional opening.

#### **6.7.4.5.9**

When pressure-building units are used, the liquid and vapour connections to that unit must be provided with a valve as close to the jacket as reasonably practicable to prevent the loss of contents in case of damage to the pressure-building unit.

- 6.7.4.5.10 Piping must be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping must be of a suitable material. To prevent leakage due to fire, only steel piping and welded joints must be used between the jacket and the connection to the first closure of any outlet. The method of attaching the closure to this connection must be to the satisfaction of the competent authority or its authorised body. Elsewhere pipe joints must be welded when necessary.
- 6.7.4.5.11 Joints in copper tubing must be brazed or have an equally strong metal union. The melting point of brazing materials must be no lower than 525 °C. The joints must not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.4.5.12 The materials of construction of valves and accessories must have satisfactory properties at the lowest operating temperature of the portable tank.
- 6.7.4.5.13 The burst pressure of all piping and pipe fittings must be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.4.6 Pressure-relief devices**
- 6.7.4.6.1 Every shell must be provided with not less than two independent spring-loaded pressure-relief devices. The pressure-relief devices must open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices must, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and must remain closed at all lower pressures. The pressure-relief devices must be of the type that will resist dynamic forces including surge.
- 6.7.4.6.2 Shells for non-flammable refrigerated liquefied gases and hydrogen may in addition have frangible discs in parallel with the spring-loaded devices as specified in 6.7.4.7.2 and 6.7.4.7.3.
- 6.7.4.6.3 Pressure-relief devices must be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.4.6.4 Pressure-relief devices must be approved by the competent authority or its authorised body.
- 6.7.4.7 Capacity and setting of pressure-relief devices**
- 6.7.4.7.1 In the case of the loss of vacuum in a vacuum-insulated tank or of loss of 20% of the insulation of a tank insulated with solid materials, the combined capacity of all pressure-relief devices installed must be sufficient so that the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP.

- 6.7.4.7.2 For non-flammable refrigerated liquefied gases (except oxygen) and hydrogen, this capacity may be achieved by the use of frangible discs in parallel with the required safety-relief devices. Frangible discs must rupture at nominal pressure equal to the test pressure of the shell.
- 6.7.4.7.3 Under the circumstances described in 6.7.4.7.1 and 6.7.4.7.2 together with complete fire engulfment the combined capacity of all pressure-relief devices installed must be sufficient to limit the pressure in the shell to the test pressure.
- 6.7.4.7.4 The required capacity of the relief devices must be calculated in accordance with a well-established technical code recognised by the competent authority<sup>1</sup>.

#### **6.7.4.8 Marking of pressure-relief devices**

- 6.7.4.8.1 Every pressure-relief device must be plainly and permanently marked with the following:
- (a) The pressure (in bar or kPa) at which it is set to discharge;
  - (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
  - (c) The reference temperature corresponding to the rated pressure for frangible discs;
  - (d) The rated flow capacity of the device in standard cubic metres of air per second (m<sup>3</sup>/s); and
  - (e) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm<sup>2</sup>.

When practicable, the following information must also be shown:

- (f) The manufacturer's name and relevant catalogue number.
- 6.7.4.8.2 The rated flow capacity marked on the pressure-relief devices must be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

#### **6.7.4.9 Connections to pressure-relief devices**

- 6.7.4.9.1 Connections to pressure-relief devices must be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve must be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that the requirements of 6.7.4.7 are always fulfilled. There must be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device.
- Pipework to vent the vapour or liquid from the outlet of the pressure-relief devices, when used, must deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

---

<sup>1</sup>See for example CGA S-1.2-2003 "Pressure Relief Device Standards-Part 2-Cargo and Portable Tanks for Compressed Gases"

#### **6.7.4.10**

#### **Siting of pressure-relief devices**

##### **6.7.4.10.1**

Each pressure-relief device inlet must be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets must under maximum filling conditions be situated in the vapour space of the shell and the devices must be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For refrigerated liquefied gases, the escaping vapour must be directed away from the tank and in such a manner that it cannot impinge upon the tank. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

##### **6.7.4.10.2**

Arrangements must be made to prevent access to the devices by unauthorised persons and to protect the devices from damage caused by the portable tank overturning.

#### **6.7.4.11**

#### **Gauging devices**

##### **6.7.4.11.1**

Unless a portable tank is intended to be filled by mass, it must be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell must not be used.

##### **6.7.4.11.2**

A connection for a vacuum gauge must be provided in the jacket of a vacuum-insulated portable tank.

#### **6.7.4.12**

#### **Portable tank supports, frameworks, lifting and tie-down attachments**

##### **6.7.4.12.1**

Portable tanks must be designed and constructed with a support structure to provide a secure base during transport. The forces specified in 6.7.4.2.12 and the safety factor specified in 6.7.4.2.13 must be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

##### **6.7.4.12.2**

The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments must not cause excessive stress in any portion of the tank.

Permanent lifting and tie-down attachments must be fitted to all portable tanks. Preferably they must be fitted to the portable tank supports but may be secured to reinforcing plates located on the tank at the points of support.

##### **6.7.4.12.3**

In the design of supports and frameworks the effects of environmental corrosion must be taken into account.

##### **6.7.4.12.4**

Forklift pockets must be capable of being closed off. The means of closing forklift pockets must be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The tank and all the fittings are well protected from being hit by the forklift blades; and

- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

#### 6.7.4.12.5

When portable tanks are not protected during transport, according to 4.2.3.3, the shells and service equipment must be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings must be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995;
- (e) Protection of the portable tank from impact or overturning by a vacuum insulation jacket.

### 6.7.4.13

#### Design approval

#### 6.7.4.13.1

The competent authority or its authorised body must issue a design approval certificate for any new design of a portable tank. This certificate must attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this chapter. When a series of portable tanks is manufactured without change in the design, the certificate must be valid for the entire series. The certificate must refer to the prototype test report, the refrigerated liquefied gases allowed to be transported, the materials of construction of the shell and jacket and an approval number. The approval number must consist of the distinguishing sign or mark of the State in whose territory the approval was granted, indicated by the distinguishing sign for use in international road traffic<sup>1</sup> (for Australia, the letters 'AUS'), and a registration number. Any alternative arrangements according to 6.7.1.2 must be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

#### 6.7.4.13.2

The prototype test report for the design approval must include at least the following:

- (a) The results of the applicable frame-work test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.4.14.3; and
- (c) The results of the impact test in 6.7.4.14.1, when applicable.

---

<sup>1</sup>*Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.*

#### **6.7.4.14**

#### **Inspection and testing**

##### **6.7.4.14.1**

Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, must not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual for Tests and Criteria, part IV, section 41

##### **6.7.4.14.2**

The tank and items of equipment of each portable tank must be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test must be performed regardless of the last periodic inspection and test when necessary according to 6.7.4.14.7.

##### **6.7.4.14.3**

The initial inspection and test of a portable tank must include a check of the design characteristics, an internal and external examination of the portable tank shell and its fittings with due regard to the refrigerated liquefied gases to be transported, and a pressure test referring to the test pressures according to 6.7.4.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorised body. Before the portable tank is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment must also be performed. When the shell and its fittings have been pressure-tested separately, they must be subjected together after assembly to a leakproofness test. All welds subject to full stress level must be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.

##### **6.7.4.14.4**

The 5 and 2.5 year periodic inspections and tests must include an external examination of the portable tank and its fittings with due regard to the refrigerated liquefied gases transported, a leakproofness test, a test of the satisfactory operation of all service equipment and a vacuum reading, when applicable. In the case of non-vacuum insulated tanks, the jacket and insulation must be removed during the 2.5 year and a 5 year periodic inspection and tests but only to the extent necessary for a reliable appraisal.

##### **6.7.4.14.5**

Deleted

##### **6.7.4.14.6**

A portable tank may not be filled and offered for transport after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.4.14.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be transported for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be transported after the date of expiry of the last periodic test and inspection:

- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
  - (b) Unless otherwise exempted by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption must be mentioned in the transport document.
- 6.7.4.14.6.1 Except as provided for in 6.7.4.14.6, portable tanks which have missed the timeframe for their scheduled 5 year or 2.5 year periodic inspection and test may only be filled and offered for transport if a new 5 year periodic inspection and test is performed according to 6.7.4.14.4
- 6.7.4.14.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, leakage, or any other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test must depend on the amount of damage or deterioration of the portable tank. It must include at least the 2.5 year inspection and test according to 6.7.4.14.4.
- 6.7.4.14.8 The internal examination during the initial inspection and test must ensure that the shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, that might render the portable tank unsafe for transport.
- 6.7.4.14.9 The external examination must ensure that:
  - (a) The external piping, valves, pressurising/cooling systems when applicable and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or transport;
  - (b) There is no leakage at any manhole covers or gaskets;
  - (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves must be operated to demonstrate proper operation;
  - (e) Required marks on the portable tank are legible and in accordance with the applicable requirements; and
  - (f) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.

- 6.7.4.14.10 The inspections and tests in 6.7.4.14.1, 6.7.4.14.3, 6.7.4.14.4, 6.7.4.14.5 and 6.7.4.14.7 must be performed or witnessed by an expert recognised by the competent authority or its authorised body. When the pressure test is a part of the inspection and test, the test pressure must be the one indicated on the data plate of the portable tank. While under pressure, the portable tank must be inspected for any leaks in the shell, piping or equipment.
- 6.7.4.14.11 In all cases when cutting, burning or welding operations on the shell of a portable tank have been effected, that work must be to the approval of the competent authority or its authorised body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure must be performed after the work is completed.
- 6.7.4.14.12 When evidence of any unsafe condition is discovered, the portable tank must not be returned to service until it has been corrected and the test is repeated and passed.

## 6.7.4.15

### Marking

- 6.7.4.15.1 Every portable tank must be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell must be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information must be marked on the plate by stamping or by any other similar method:
- (a) Owner information
    - (i) Owner's registration number;
  - (b) Manufacturing information
    - (i) Country of manufacture;
    - (ii) Year of manufacture;
    - (iii) Manufacturer's name or mark;
    - (iv) Manufacturer's serial number;
  - (c) Approval information
    - (i) The United Nations packaging symbol 

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8;
    - (ii) Approval country;
    - (iii) Authorised body for the design approval;
    - (iv) Design approval number;
    - (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
    - (vi) Pressure vessel code to which the shell is designed;

- (d) Pressures
  - (i) MAWP (in bar gauge or kPa gauge)<sup>1</sup>;
  - (ii) Test pressure (in bar gauge or kPa gauge)<sup>1</sup>;
  - (iii) Initial pressure test date (month and year);
  - (iv) Identification mark of the initial pressure test witness;
- (e) Temperatures
  - (i) Minimum design temperature (in °C)<sup>1</sup>;
- (f) Materials
  - (i) Shell material(s) and material standard reference(s);
  - (ii) Equivalent thickness in reference steel (in mm)<sup>1</sup>;
- (g) Capacity
  - (i) Tank water capacity at 20 °C (in litres)<sup>1</sup>;
- (h) Insulation
  - (i) Either “Thermally insulated” or “Vacuum insulated” (as applicable);
  - (ii) Effectiveness of the insulation system (heat influx) (in watts)<sup>1</sup>;
- (i) Holding times – For each refrigerated liquefied gas permitted to be transported in the portable tank:
  - (i) Name, in full, of the refrigerated liquefied gas;
  - (ii) Reference holding time (in days or hours)<sup>1</sup>;
  - (iii) Initial pressure (in bar gauge or kPa gauge)<sup>1</sup>;
  - (iv) Maximum allowable mass of gas filled (in kg)<sup>1</sup>;
- (j) Periodic inspections and tests
  - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
  - (ii) Date of the most recent periodic test (month and year);
  - (iii) Identification mark of the authorised body who performed or witnessed the most recent test.

**Figure 6.7.4.15.1: Example of a plate for marking**

| Initial pressure test date:                                 |           | (mm/yyyy)                   | Witness stamp:   |                                      |               |
| <b>TEMPERATURES</b>                                         |           |                             |                  |                                      |               |
| Minimum design temperature                                  |           |                             | °C               |                                      |               |
| <b>MATERIALS</b>                                            |           |                             |                  |                                      |               |
| Shell material(s) and material standard reference(s)        |           |                             |                  |                                      |               |
| Equivalent thickness in reference steel                     |           |                             | mm               |                                      |               |
| <b>CAPACITY</b>                                             |           |                             |                  |                                      |               |
| Tank water capacity at 20 °C                                |           |                             | litres           |                                      |               |
| <b>INSULATION</b>                                           |           |                             |                  |                                      |               |
| 'Thermally insulated' or 'Vacuum insulated' (as applicable) |           |                             |                  |                                      |               |
| Heat influx                                                 |           |                             | Watts            |                                      |               |
| <b>HOLDING TIMES</b>                                        |           |                             |                  |                                      |               |
| Refrigerated liquefied gas(es) permitted                    |           | Reference hold-<br>ing time | Initial pressure | Maximum allowable mass of gas filled |               |
|                                                             |           | days or hours               | bar or kPa       | kg                                   |               |
|                                                             |           |                             |                  |                                      |               |
|                                                             |           |                             |                  |                                      |               |
|                                                             |           |                             |                  |                                      |               |
|                                                             |           |                             |                  |                                      |               |
| <b>PERIODIC INSPECTIONS / TESTS</b>                         |           |                             |                  |                                      |               |
| Test type                                                   | Test date | Witness stamp               | Test type        | Test date                            | Witness stamp |
|                                                             | (mm/yyyy) |                             |                  | (mm/yyyy)                            |               |
|                                                             |           |                             |                  |                                      |               |
|                                                             |           |                             |                  |                                      |               |
|                                                             |           |                             |                  |                                      |               |

6.7.4.15.2

The following information must be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank.

Name of the owner and the operator

Name of the refrigerated liquefied gas being transported (and minimum mean bulk temperature)

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

Actual holding time for gas being transported \_\_\_\_\_ days (or hours)  
Portable tank instruction in accordance with 4.2.5.2.6

**NOTE:** For the identification of the refrigerated liquefied gas(es) being transported, see also part 5.

6.7.4.15.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" must be marked on the identification plate.

## 6.7.5 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF MULTIPLE-ELEMENT GAS CONTAINERS (MEGCS) INTENDED FOR THE TRANSPORT OF NON-REFRIGERATED GASES

### 6.7.5.1 Application and Definitions

#### 6.7.5.1.1 Application

This Section must be applied in conjunction with the legislation applicable in the particular State or Territory to pressure vessels. Where there is conflict, the requirements of that legislation and any Codes and Standards mandated by that legislation take precedence over this Section.

#### 6.7.5.1.2 Definitions

For the purposes of this section:

**Elements** are cylinders, tubes or bundles of cylinders;

**Leakproofness test** means a test using gas subjecting the elements and the service equipment of the MEGC to an effective internal pressure of not less than 20% of the test pressure;

**Manifold** means an assembly of piping and valves connecting the filling and/or discharge openings of the elements;

**Maximum permissible gross mass (MPGM)** means the sum of the tare mass of the MEGC and the heaviest load authorised for transport;

**Service equipment** means measuring instruments and filling, discharge, venting and safety devices;

**Structural equipment** means the reinforcing, fastening, protective and stabilising members external to the elements.

### 6.7.5.2 General design and construction requirements

6.7.5.2.1 The MEGC must be capable of being filled and discharged without the removal of its structural equipment. It must possess stabilising members external to the elements to provide structural integrity for handling and transport. MEGCs must be designed and constructed with supports to provide a secure base during transport and with lifting and tie-down attachments which are adequate for lifting the MEGC including when loaded to its maximum permissible gross mass. The MEGC must be designed to be loaded onto a cargo transport unit or ship and must be equipped with skids, mountings or accessories to facilitate mechanical handling.

- 6.7.5.2.2 MEGCs must be designed, manufactured and equipped in such a way as to withstand all conditions to which they will be subjected during normal conditions of handling and transport. The design must take into account the effects of dynamic loading and fatigue.
- 6.7.5.2.3 Elements of an MEGC must be made of seamless steel or composite construction and be constructed and tested according to chapter 6.2. All of the elements in an MEGC must be of the same design type.
- 6.7.5.2.4 Elements of MEGCs, fittings and pipework must be:
- (a) compatible with the substances intended to be transported (for gases see ISO 11114-1:2020 and ISO 11114-2:2021); or
  - (b) properly passivated or neutralised by chemical reaction.
- 6.7.5.2.5 Contact between dissimilar metals which could result in damage by galvanic action must be avoided.
- 6.7.5.2.6 The materials of the MEGC, including any devices, gaskets, and accessories, must not adversely affect the gases intended for transport in the MEGC.
- 6.7.5.2.7 MEGCs must be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and transport. The design must demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the multiple-element gas container, have been taken into account.
- 6.7.5.2.8 MEGCs and their fastenings must, under the maximum permissible load, be capable of withstanding the following separately applied static forces:
- (a) in the direction of travel: twice the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (b) horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces must be equal to twice the MPGM) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>;
  - (c) vertically upwards: the MPGM multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>; and
  - (d) vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity ( $g$ )<sup>1</sup>.
- 6.7.5.2.9 Under the forces defined above, the stress at the most severely stressed point of the elements must not exceed the values given in either the relevant standards of 6.2.2.1 or, if the elements are not designed, constructed and tested according to those standards, in the technical code or standard recognised or approved by the competent authority of the country of use (see 6.2.3.1).
- 6.7.5.2.10 Under each of the forces in 6.7.5.2.8, the safety factor for the framework and fastenings to be observed must be as follows:

---

<sup>1</sup>For calculation purposes  $g = 9.81 \text{ m/s}^2$ .

- (a) for steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
- (b) for steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.

6.7.5.2.11 MEGCs intended for the transport of flammable gases must be capable of being electrically earthed.

6.7.5.2.12 The elements must be secured in a manner that prevents undesired movement in relation to the structure and the concentration of harmful localised stresses.

### **6.7.5.3 Service equipment**

6.7.5.3.1 Service equipment must be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and transport. When the connection between the frame and the elements allows relative movement between the sub-assemblies, the equipment must be so fastened as to permit such movement without damage to working parts. The manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves must be protected from being wrenched off by external forces. Manifold piping leading to shut-off valves must be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps must be capable of being secured against unintended opening.

6.7.5.3.2 Each element intended for the transport of gases of Division 2.3 must be fitted with a valve. The manifold for liquefied gases of Division 2.3 must be so designed that the elements can be filled separately and be kept isolated by a valve capable of being sealed. For the transport of gases of Division 2.1, the elements must be divided into groups of not more than 3000 litres isolated by a valve.

6.7.5.3.3 For filling and discharge openings of the MEGC, two valves in series must be placed in an accessible position on each discharge and filling pipe. One of the valves may be a non-return valve. The filling and discharge devices may be fitted to a manifold. For sections of piping which can be closed at both ends and where a liquid product can be trapped, a pressure-relief valve must be provided to prevent excessive pressure build-up. The main isolation valves on an MEGC must be clearly marked to indicate their directions of closure. Each stop-valve or other means of closure must be designed and constructed to withstand a pressure equal to or greater than 1.5 times the test pressure of the MEGC. All stop-valves with screwed spindles must close by a clockwise motion of the handwheel. For other stop-valves, the position (open or closed) and direction of closure must be clearly indicated. All stop-valves must be designed and positioned to prevent unintentional opening. Ductile metals must be used in the construction of valves or accessories.

6.7.5.3.4 Piping must be designed, constructed and installed so as to avoid damage due to expansion and contraction, mechanical shock and vibration. Joints in tubing must be brazed or have an equally strong metal union. The melting point of brazing materials must be no lower than 525 °C. The rated pressure of the service equipment and of the manifold must be not less than two thirds of the test pressure of the elements.

#### **6.7.5.4 Pressure-relief devices**

6.7.5.4.1 The elements of MEGCs used for the transport of UN 1013 carbon dioxide and UN 1070 nitrous oxide must be isolated by a valve into assemblies of not more than 3000 litres. Each assembly must be fitted with one or more pressure relief devices. If so required by the competent authority of the country of use, MEGCs for other gases must be fitted with pressure relief devices as specified by that competent authority.

6.7.5.4.2 When pressure relief devices are fitted, every element or group of elements of an MEGC that can be isolated must then be fitted with one or more pressure relief devices. Pressure relief devices must be of a type that will resist dynamic forces including liquid surge and must be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.

6.7.5.4.3 MEGCs used for the transport of certain non-refrigerated gases identified in instruction T50 in 4.2.5.2.6 may have a pressure-relief device as required by the competent authority of the country of use. Unless an MEGC in dedicated service is fitted with an approved pressure relief device constructed of materials compatible with the load, such a device must comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the spring-loaded device may be equipped with a pressure gauge or a suitable telltale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure relief device. The frangible disc must rupture at a nominal pressure 10% above the start-to-discharge pressure of the spring-loaded device.

6.7.5.4.4 In the case of multi-purpose MEGCs used for the transport of low-pressure liquefied gases, the pressure-relief devices must open at a pressure as specified in 6.7.3.7.1 for the gas having the highest maximum allowable working pressure of the gases allowed to be transported in the MEGC.

### **6.7.5.5**

### **Capacity of pressure relief devices**

#### **6.7.5.5.1**

The combined delivery capacity of the pressure relief devices when fitted must be sufficient that, in the event of total fire engulfment of the MEGC, the pressure (including accumulation) inside the elements does not exceed 120% of the set pressure of the pressure relief device. The formula provided in CGA S-1.2-2003 "Pressure Relief Device Standards, Part 2, Cargo and Portable Tanks for Compressed Gases" must be used to determine the minimum total flow capacity for the system of pressure relief devices. CGA S-1.1-2003 "Pressure Relief Device Standards, Part 1, Cylinders for Compressed Gases" may be used to determine the relief capacity of individual elements. Spring-loaded pressure relief devices may be used to achieve the full relief capacity prescribed in the case of low pressure liquefied gases. In the case of multi-purpose MEGCs, the combined delivery capacity of the pressure-relief devices must be taken for the gas which requires the highest delivery capacity of the gases allowed to be transported in the MEGC.

#### **6.7.5.5.2**

To determine the total required capacity of the pressure relief devices installed on the elements for the transport of liquefied gases, the thermodynamic properties of the gas must be considered (see, for example, CGA S-1.2-2003 "Pressure Relief Device Standards – Part 2 – Cargo and Portable Tanks for Compressed Gases" for low pressure liquefied gases and CGA S-1.1-2003 "Pressure Relief Device Standards, Part 1, Cylinders for Compressed Gases" for high pressure liquefied gases).

### **6.7.5.6**

### **Marking of pressure-relief devices**

#### **6.7.5.6.1**

Pressure relief devices must be clearly and permanently marked with the following:

- (a) the manufacturer's name and relevant catalogue number.
- (b) the set pressure and/or the set temperature;
- (c) the date of the last test;
- (d) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm<sup>2</sup>.

#### **6.7.5.6.2**

The rated flow capacity marked on spring loaded pressure relief devices for low pressure liquefied gases must be determined according to ISO 4126 1:2004 and ISO 4126-7:2004.

### **6.7.5.7**

#### **Connections to pressure-relief devices**

##### **6.7.5.7.1**

Connections to pressure-relief devices must be of sufficient size to enable the required discharge to pass unrestricted to the pressure relief device. No stop-valve must be installed between the element and the pressure-relief devices, except when duplicate devices are provided for maintenance or other reasons, and the stop-valves serving the devices actually in use are locked open, or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.5.5. There must be no obstruction in an opening leading to or leaving from a vent or pressure-relief device which might restrict or cut-off the flow from the element to that device. The opening through all piping and fittings must have at least the same flow area as the inlet of the pressure relief device to which it is connected. The nominal size of the discharge piping must be at least as large as that of the pressure relief device outlet. Vents from the pressure-relief devices, when used, must deliver the relieved vapour or liquid to the atmosphere in conditions of minimum backpressure on the relieving device.

### **6.7.5.8**

#### **Siting of pressure-relief devices**

##### **6.7.5.8.1**

Each pressure relief device must, under maximum filling conditions, be in communication with the vapour space of the elements for the transport of liquefied gases. The devices, when fitted, must be so arranged as to ensure that the escaping vapour is discharged upwards and unrestrictedly as to prevent any impingement of escaping gas or liquid upon the MEGC, its elements or personnel. For flammable, pyrophoric and oxidising gases, the escaping gas must be directed away from the element in such a manner that it cannot impinge upon the other elements. Heat resistant protective devices which deflect the flow of gas are permissible provided the required pressure relief device capacity is not reduced.

##### **6.7.5.8.2**

Arrangements must be made to prevent access to the pressure-relief devices by unauthorised persons and to protect the devices from damage caused by the MEGC overturning.

### **6.7.5.9**

#### **Gauging devices**

##### **6.7.5.9.1**

When a MEGC is intended to be filled by mass, it must be equipped with one or more gauging devices. Level-gauges made of glass or other fragile material must not be used.

#### **6.7.5.10**

#### **MEGC supports, frameworks, lifting and tie-down attachments**

##### **6.7.5.10.1**

MEGCs must be designed and constructed with a support structure to provide a secure base during transport. The forces specified in 6.7.5.2.8 and the safety factor specified in 6.7.5.2.10 must be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

##### **6.7.5.10.2**

The combined stresses caused by element mountings (e.g. cradles, frameworks, etc.) and MEGC lifting and tie-down attachments must not cause excessive stress in any element. Permanent lifting and tie-down attachments must be fitted to all MEGCs. In no case must mountings or attachments be welded onto the elements.

##### **6.7.5.10.3**

In the design of supports and frameworks, the effects of environmental corrosion must be taken into account.

##### **6.7.5.10.4**

When MEGCs are not protected during transport, according to 4.2.4.3, the elements and service equipment must be protected against damage resulting from lateral or longitudinal impact or overturning. External fittings must be protected so as to preclude the release of the elements' contents upon impact or overturning of the MEGC on its fittings. Particular attention must be paid to the protection of the manifold. Examples of protection include:

- (a) protection against lateral impact which may consist of longitudinal bars;
- (b) protection against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) protection against rear impact which may consist of a bumper or frame;
- (d) protection of the elements and service equipment against damage from impact or overturning by use of an ISO frame in accordance with the relevant provisions of ISO 1496-3:1995.

### **6.7.5.11**

#### **Design approval**

##### **6.7.5.11.1**

The competent authority or its authorised body must issue a design approval certificate for any new design of a MEGC. This certificate must attest that the MEGC has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this chapter, the applicable provisions for gases of chapter 4.1 and of packing instruction P200. When a series of MEGCs are manufactured without change in the design, the certificate must be valid for the entire series. The certificate must refer to the prototype test report, the materials of construction of the manifold, the standards to which the elements are made and an approval number. The approval number must consist of the distinguishing sign or mark of the country granting the approval, indicated by the distinguishing sign used on vehicles in international road traffic Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968. (for Australia, the letters 'AUS'), and a registration number. Any alternative arrangements according to 6.7.1.2 must be indicated on the certificate. A design approval may serve for the approval of smaller MEGCs made of materials of the same type and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

##### **6.7.5.11.2**

The prototype test report for the design approval must include at least the following:

- (a) the results of the applicable framework test specified in ISO 1496-3:1995;
- (b) the results of the initial inspection and test specified in 6.7.5.12.3;
- (c) the results of the impact test specified in 6.7.5.12.1; and
- (d) certification documents verifying that the cylinders and tubes comply with the applicable standards.

### **6.7.5.12**

#### **Inspection and testing**

##### **6.7.5.12.1**

MEGCs meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended must not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual for Tests and Criteria, part IV, section 41.

##### **6.7.5.12.2**

The elements and items of equipment of each MEGC must be inspected and tested before being put into service for the first time (initial inspection and test). Thereafter, MEGCs must be inspected at no more than five-year intervals (5 year periodic inspection). An exceptional inspection and test must be performed, regardless of the last periodic inspection and test, when necessary according to 6.7.5.12.5.

- 6.7.5.12.3 The initial inspection and test of an MEGC must include a check of the design characteristics, an external examination of the MEGC and its fittings with due regard to the gases to be transported, and a pressure test performed at the test pressures according to packing instruction P200. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorised body. Before the MEGC is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment must also be performed. When the elements and their fittings have been pressure-tested separately, they must be subjected together after assembly to a leakproofness test.
- 6.7.5.12.4 The 5-year periodic inspection and test must include an external examination of the structure, the elements and the service equipment in accordance with 6.7.5.12.6. The elements and the piping must be tested at the periodicity specified in packing instruction P200 and in accordance with the provisions described in 6.2.1.6. When the elements and equipment have been pressure-tested separately, they must be subjected together after assembly to a leakproofness test.
- 6.7.5.12.5 An exceptional inspection and test is necessary when the MEGC shows evidence of damaged or corroded areas, leakage, or other conditions that indicate a deficiency that could affect the integrity of the MEGC. The extent of the exceptional inspection and test must depend on the amount of damage or deterioration of the MEGC. It must include at least the examinations required under 6.7.5.12.6.
- 6.7.5.12.6 The examinations must ensure that:
- (a) the elements are inspected externally for pitting, corrosion, abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the MEGC unsafe for transport;
  - (b) the piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render the MEGC unsafe for filling, discharge or transport;
  - (c) missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
  - (d) all emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves must be operated to demonstrate proper operation;
  - (e) required marks on the MEGC are legible and in accordance with the applicable requirements; and
  - (f) the framework, the supports and the arrangements for lifting the MEGC are in satisfactory condition.
- 6.7.5.12.7 The inspections and tests in 6.7.5.12.1, 6.7.5.12.3, 6.7.5.12.4 and 6.7.5.12.5 must be performed or witnessed by a body authorised by the competent authority. When the pressure test is a part of the inspection and test, the test pressure must be the one indicated on the data plate of the MEGC. While under pressure, the MEGC must be inspected for any leaks in the elements, piping or equipment.

6.7.5.12.8

When evidence of any unsafe condition is discovered, the MEGC must not be returned to service until it has been corrected and the applicable tests and verifications are passed.

### 6.7.5.13

#### Marking

6.7.5.13.1

Every MEGC must be fitted with a corrosion resistant metal plate permanently attached to the MEGC in a conspicuous place readily accessible for inspection. The metal plate must not be affixed to the elements. The elements must be marked in accordance with Chapter 6.2. As a minimum, at least the following information must be marked on the plate by stamping or by any other similar method:

- (g) Owner information
  - (i) Owner's registration number;
- (h) Manufacturing information
  - (i) Country of manufacture;
  - (ii) Year of manufacture;
  - (iii) Manufacturer's name or mark;
  - (iv) Manufacturer's serial number;
- (i) Approval information

- (i) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8

- (ii) Approval country;
- (iii) Authorised body for the design approval;
- (iv) Design approval number;
- (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
- (d) Pressures
  - (i) Test pressure (in bar gauge)<sup>1</sup>;
  - (ii) Initial pressure test date (month and year);
  - (iii) Identification mark of the initial pressure test witness;
- (e) Temperatures
  - (i) Design temperature range (in °C)<sup>1</sup>;
- (f) Elements / Capacity
  - (i) Number of elements;
  - (ii) Total water capacity (in litres)<sup>1</sup>;
- (g) Periodic inspections and tests
  - (i) Type of the most recent periodic test (5-year or exceptional);
  - (ii) Date of the most recent periodic test (month and year);
  - (iii) Identification mark of the authorised body who performed or witnessed the most recent test.

| Number of elements                                                                |                                     |                |                      |           |               |
| Total water capacity                                                              |                                     | litres         |                      |           |               |
| <b>PERIODIC INSPECTIONS / TESTS</b>                                               |                                     |                |                      |           |               |
| Test type                                                                         | Test date                           | Witness stamp  | Test type            | Test date | Witness stamp |
|                                                                                   | (mm/yyyy)                           |                |                      | (mm/yyyy) |               |
|                                                                                   |                                     |                |                      |           |               |
|                                                                                   |                                     |                |                      |           |               |
|                                                                                   |                                     |                |                      |           |               |
|                                                                                   |                                     |                |                      |           |               |

6.7.5.13.2

The following information must be durably marked on a metal plate firmly secured to the MEGC:

Name of the operator

Maximum permissible load mass \_\_\_\_\_ kg

Working pressure at 15°C \_\_\_\_\_ bar gauge

Maximum permissible gross mass (MPGM) \_\_\_\_\_ kg

Unladen (tare) mass \_\_\_\_\_ kg

# CHAPTER 6.8: REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF BULK CONTAINERS

## 6.8.1

### DEFINITIONS

For the purposes of this section:

**Closed bulk container** means a totally closed bulk container having a rigid roof, sidewalls, end walls and floor (including hopper-type bottoms). The term includes bulk containers with an opening roof, side or end wall that can be closed during transport. Closed bulk containers may be equipped with openings to allow for the exchange of vapours and gases with air and which prevent under normal conditions of transport the release of solid contents as well as the penetration of rain and splash water.

**Flexible bulk container** means a flexible container with a capacity not exceeding 15 m<sup>3</sup> and includes liners and attached handling devices and service equipment.

**Sheeted bulk container** means an open top bulk container with rigid bottom (including hopper-type bottom), side and end walls and a non-rigid covering;

## 6.8.2

### APPLICATION AND GENERAL REQUIREMENTS

#### 6.8.2.1

Bulk containers and their service and structural equipment must be designed and constructed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and transport.

#### 6.8.2.2

Where a discharge valve is fitted, it must be capable of being made secure in the closed position and the whole discharge system must be suitably protected from damage. Valves having lever closures must be able to be secured against unintended opening and the open or closed position must be readily apparent.

#### 6.8.2.3

### Code for designating types of bulk container

The following table indicates the codes to be used for designating types of bulk containers:

| Types of bulk containers | Code |
|--------------------------|------|
| Sheeted bulk container   | BK1  |
| Closed bulk container    | BK2  |
| Flexible bulk container  | BK3  |

- 6.8.2.4 In order to take account of progress in science and technology, the use of alternative arrangements which offer at least equivalent safety as provided by the requirements of this chapter may be considered by the competent authority.
- 6.8.3 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF FREIGHT CONTAINERS USED AS BK1 OR BK2 BULK CONTAINERS**
- 6.8.3.1 Design and construction requirements**
- 6.8.3.1.1 The general design and construction requirements of this section are deemed to be met if the bulk container complies with the requirements of ISO 1496-4:1991 "Series 1 Freight containers- Specification and testing - Part 4: Non pressurised containers for dry bulk" and the container is sift-proof.
- 6.8.3.1.2 Freight containers designed and tested in accordance with ISO 1496 1:1990 "Series 1 Freight containers- Specification and testing – Part 1: General cargo containers for general purposes" must be equipped with operational equipment which is, including its connection to the freight container, designed to strengthen the end walls and to improve the longitudinal restraint as necessary to comply with the test requirements of ISO 1496-4:1991 as relevant.
- 6.8.3.1.3 Bulk containers must be siftproof. Where a liner is used to make the container siftproof it must be made of a suitable material. The strength of material used for, and the construction of, the liner must be appropriate to the capacity of the container and its intended use. Joins and closures of the liner must withstand pressures and impacts liable to occur under normal conditions of handling and transport. For ventilated bulk containers any liner must not impair the operation of ventilating devices.
- 6.8.3.1.4 The operational equipment of bulk containers designed to be emptied by tilting must be capable of withstanding the total filling mass in the tilted orientation.
- 6.8.3.1.5 Any movable roof or side or end wall or roof section must be fitted with locking devices with securing devices designed to show the locked state to an observer at ground level.
- 6.8.3.2 Service equipment**
- 6.8.3.2.1 Filling and discharge devices must be so constructed and arranged as to be protected against the risk of being wrenched off or damaged during transport and handling. The filling and discharge devices must be capable of being secured against unintended opening. The open and closed position and direction of closure must be clearly indicated.
- 6.8.3.2.2 Seals of openings must be so arranged as to avoid any damage by the operation, filling and emptying of the bulk container.

- 6.8.3.2.3 Where ventilation is required bulk containers must be equipped with means of air exchange, either by natural convection, e.g. by openings, or active elements, e.g. fans. The ventilation must be designed to prevent negative pressures in the container at all times. Ventilating elements of bulk containers for the transport of flammable substances or substances emitting flammable gases or vapours must be designed so as not to be a source of ignition.
- 6.8.3.3 Inspection and testing**
- 6.8.3.3.1 Freight containers used maintained and qualified as bulk containers in accordance with the requirements of this section must be tested and approved in accordance with the International Convention for Safe Containers (CSC), 1972, as amended.
- 6.8.3.3.2 Freight containers used and qualified as bulk containers must be inspected periodically according to the International Convention for Safe Containers (CSC), 1972, as amended.
- 6.8.3.4 Marking**
- 6.8.3.4.1 Freight containers used as bulk containers must be marked with a Safety Approval Plate in accordance with the International Convention for Safe Containers (CSC), 1972, as amended.
- 6.8.4 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION AND APPROVAL OF BK1 OR BK2 BULK CONTAINERS OTHER THAN FREIGHT CONTAINERS**
- 6.8.4.1 Bulk containers covered in this section include skips, offshore bulk containers, bulk bins, swap bodies, trough shaped containers, roller containers, and load compartments of vehicles.
- 6.8.4.2 These bulk containers must be designed and constructed so as to be strong enough to withstand the shocks and loadings normally encountered during transport including, as applicable, transshipment between modes of transport.
- 6.8.4.3 Vehicles must comply with the requirements of, and be acceptable to, the competent authority responsible for land transport of the materials to be transported in bulk.
- 6.8.4.4 These bulk containers must be approved by the competent authority and the approval must include the code for designating types of bulk containers in accordance with 6.8.2.3 and the requirements for inspection and testing as appropriate.
- 6.8.4.5 Where it is necessary to use a liner in order to retain the dangerous goods it must meet the provisions of 6.8.3.1.3.
- 6.8.4.6 Except where 6.8.4.6.1 applies, the following statement must be shown on the transport document:

“Bulk container BK(x)<sup>1</sup> approved by the competent authority of  
.....”

- 6.8.4.6.1 For transport only by road or rail within Australia, if the statement required by 6.8.4.6 is clearly and prominently marked on the outside of the bulk container, it may be omitted from the transport document.

## **6.8.5 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF FLEXIBLE BULK CONTAINERS BK3**

### **6.8.5.1 Design and construction requirements**

- 6.8.5.1.1 Flexible bulk containers must be sift-proof.
- 6.8.5.1.2 Flexible bulk containers must be completely closed to prevent the release of contents.
- 6.8.5.1.3 Flexible bulk containers must be waterproof.
- 6.8.5.1.4 Parts of the flexible bulk container which are in direct contact with dangerous goods:
- (a) Must not be affected or significantly weakened by those dangerous goods;
  - (b) Must not cause a dangerous effect e.g. catalysing a reaction or reacting with the dangerous goods; and
  - (c) Must not allow permeation of the dangerous goods that could constitute a danger under normal conditions of transport.

### **6.8.5.2 Service equipment and handling devices**

- 6.8.5.2.1 Filling and discharge devices must be so constructed as to be protected against damage during transport and handling. The filling and discharge devices must be capable of being secured against unintended opening.
- 6.8.5.2.2 Slings of the flexible bulk container, if fitted, must withstand pressure and dynamic forces which can appear in normal conditions of handling and transport.
- 6.8.5.2.3 The handling devices must be strong enough to withstand repeated use.

### **6.8.5.3 Inspection and testing**

- 6.8.5.3.1 Each flexible bulk container design type must successfully pass the tests prescribed in this chapter before being used.
- 6.8.5.3.2 Tests must also be repeated after each modification of design type which alters the design, material or manner of construction of a flexible bulk container.

---

<sup>1</sup>x must be replaced with ‘1’ or ‘2’ as appropriate.

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.8.5.3.3   | Tests must be carried out on flexible bulk containers prepared as for transport. Flexible bulk containers must be filled to the maximum mass at which they may be used and the contents must be evenly distributed. The substances to be transported in the flexible bulk container may be replaced by other substances except where this would invalidate the results of the tests. When another substance is used it must have the same physical characteristics (mass, grain size, etc.) as the substance to be transported. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total mass of the flexible bulk container, so long as they are placed so that the test results are not affected. |
| 6.8.5.3.4   | Flexible bulk containers must be manufactured and tested under a quality assurance programme which satisfies the competent authority, in order to ensure that each manufactured flexible bulk container meets the requirements of this chapter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 6.8.5.3.5   | Drop test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 6.8.5.3.5.1 | Applicability<br>For all types of flexible bulk containers, as a design type test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 6.8.5.3.5.2 | Preparation for testing<br>The flexible bulk container must be filled to its maximum permissible gross mass.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6.8.5.3.5.3 | The flexible bulk container must be dropped onto a target surface that is non-resilient and horizontal. The target surface must be: <ul style="list-style-type: none"> <li>(a) Integral and massive enough to be immovable;</li> <li>(b) Flat with a surface kept free from local defects capable of influencing the test results;</li> <li>(c) Rigid enough to be non-deformable under test conditions and not liable to become damaged by the tests; and</li> <li>(d) Sufficiently large to ensure that the test flexible bulk container falls entirely upon the surface.</li> </ul> Following the drop, the flexible bulk container must be restored to the upright position for observation.                                         |
| 6.8.5.3.5.4 | Drop height must be:<br>Packing group III: 0.8 m                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 6.8.5.3.5.5 | Criteria for passing the test: <ul style="list-style-type: none"> <li>(a) There must be no loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact is not to be considered to be a failure of the flexible bulk container provided that no further leakage occurs after the container has been restored to the upright position;</li> <li>(b) There must be no damage which renders the flexible bulk container unsafe to be transported for salvage or for disposal.</li> </ul>                                                                                                                                                                                                                           |
| 6.8.5.3.6   | Top lift test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6.8.5.3.6.1 | Applicability<br>For all types of flexible bulk containers as a design type test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 6.8.5.3.6.2 | Preparation for testing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 6.8.5.3.9.2    | <p>Preparation for testing</p> <p>The flexible bulk container must be filled to its maximum permissible gross mass.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6.8.5.3.9.3    | <p>With the flexible bulk container placed on the ground, a 300 mm cut must be made, completely penetrating all layers of the flexible bulk container on a wall of a wide face. The cut must be made at a 45° angle to the principal axis of the flexible bulk container, halfway between the bottom surface and the top level of the contents. The flexible bulk container must then be subjected to a uniformly distributed superimposed load equivalent to twice the maximum gross mass. The load must be applied for at least fifteen minutes. A flexible bulk container which is designed to be lifted from the top or the side must, after removal of the superimposed load, be lifted clear of the floor and maintained in that position for a period of fifteen minutes.</p>                 |
| 6.8.5.3.9.4    | <p>Criterion for passing the test: the cut must not propagate more than 25% of its original length.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>6.8.5.4</b> | <p><b>Test report</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6.8.5.4.1      | <p>A test report containing at least the following particulars must be drawn up and must be available to the users of the flexible bulk container:</p> <ol style="list-style-type: none"> <li>1. Name and address of the test facility;</li> <li>2. Name and address of applicant (where appropriate);</li> <li>3. Unique test report identification;</li> <li>4. Date of the test report;</li> <li>5. Manufacturer of the flexible bulk container;</li> <li>6. Description of the flexible bulk container design type (e.g. dimensions, materials, closures, thickness, etc.) and/or photograph(s);</li> <li>7. Maximum capacity/maximum permissible gross mass;</li> <li>8. Characteristics of test contents, e.g. particle size for solids;</li> <li>9. Test descriptions and results;</li> </ol> |

10. The test report must be signed with the name and status of the signatory.

6.8.5.4.2

The test report must contain statements that the flexible bulk container prepared as for transport was tested in accordance with the appropriate provisions of this chapter and that the use of other containment methods or components may render it invalid. A copy of the test report must be available to the competent authority.

## 6.8.5.5

### Marking

6.8.5.5.1

Each flexible bulk container manufactured and intended for use according to this Code must bear marks that are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols must be at least 24 mm high and must show:

- (a) The United Nations packaging symbol

This symbol must not be used for any purpose other than certifying that a packaging, a flexible bulk container, a portable tank or a MEGC complies with the relevant requirements in chapter 6.1, 6.2, 6.3, 6.5, 6.6, 6.7 or 6.8 ;

- (b) The code BK3;  
(c) A capital letter designating the packing group(s) for which the design type has been approved:  
Z for packing group III only;  
(d) The month and year (last two digits) of manufacture;  
(e) The character(s) identifying the country authorising the allocation of the mark; as indicated by the distinguishing signs used on vehicles in international road traffic<sup>1</sup>;  
(f) The name or symbol of the manufacturer and other identification of the flexible bulk container as specified by the competent authority;  
(g) The stacking test load in kg;  
(h) The maximum permissible gross mass in kg.

Marks must be applied in the sequence shown in (a) to (h); each mark, required in these subparagraphs, must be clearly separated, e.g. by a slash or space and presented in a way that ensures that all of the parts of the mark are easily identified.

6.8.5.5.2

Example of marking

BK3/Z/11 09  
RUS/NTT/MK-14-10  
56000/14000".

---

<sup>1</sup>Distinguishing sign of the State of registration used on motor vehicles and trailers in international road traffic, e.g. in accordance with the Geneva Convention on Road Traffic of 1949 or the Vienna Convention on Road Traffic of 1968.

## CHAPTER 6.9: REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION, AND TESTING OF PORTABLE TANKS WITH SHELLS MADE OF FIBRE REINFORCED PLASTICS (FRP) MATERIALS

### 6.9.1 APPLICATION AND GENERAL REQUIREMENTS

- 6.9.1.1 The requirements of section 6.9.2 apply to portable tanks with an FRP shell intended for the transport of dangerous goods of classes or divisions 1, 3, 5.1, 6.1, 6.2, 8 and 9 by all modes of transport. In addition to the requirements of this chapter, unless otherwise specified, the applicable requirements of the International Convention for Safe Containers (CSC) 1972, as amended, shall be fulfilled by any multimodal portable tank with FRP shell which meets the definition of a "container" within the terms of that Convention.
- 6.9.1.2 The requirements of this Chapter do not apply to offshore portable tanks.
- 6.9.1.3 The requirements of chapter 4.2, and section 6.7.2 apply to FRP portable tank shells except for those concerning the use of metal materials for the construction of a portable tank shell and additional requirements stated in this chapter.
- 6.9.1.4 In recognition of scientific and technological advances, the technical requirements of this chapter may be varied by alternative arrangements. These alternative arrangements shall offer a level of safety not less than that given by the requirements of this chapter with respect to compatibility with substances transported and the ability of the FRP portable tank to withstand impact, loading and fire conditions. For international transport, alternative arrangement FRP portable tanks shall be approved by the applicable competent authorities.

### 6.9.2 REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF FRP PORTABLE TANKS

#### 6.9.2.1 Definitions

For the purposes of this section, the definitions of 6.7.2.1 apply except for definitions related to metal materials ("Fine grain steel", "Mild steel" and "Reference steel") for the construction of the shell of a portable tank. Additionally, the following definitions apply to portable tanks with an FRP shell:

**External layer** means the part of the shell which is directly exposed to the atmosphere;

**Fibre-Reinforced Plastic (FRP)** means material consisting of fibrous and/or particulate reinforcement contained within a thermoset or thermoplastic polymer (matrix);

**Filament winding** means a process for constructing FRP structures in which continuous reinforcements (filament, tape, or other), either previously impregnated with a matrix material or impregnated during

winding, are placed over a rotating mandrel. Generally, the shape is a surface of revolution and may include ends (heads);

**FRP shell** means a closed part of cylindrical shape with an interior volume intended for transport of chemical substances;

**FRP tank** means a portable tank constructed with an FRP shell and ends (heads), service equipment, safety relief devices and other installed equipment;

**Glass transition temperature** ( $T_g$ ) means a characteristic value of the temperature range over which the glass transition takes place;

**Hand layup** means a process for moulding reinforced plastics in which reinforcement and resin are placed on a mould;

**Liner** means a layer on the inner surface of an FRP shell preventing contact with the dangerous goods being transported;

**Mat** means a fibre reinforcement made of random, chopped or twisted fibres bonded together as sheets of various length and thickness;

**Parallel shell-sample** means an FRP specimen, which must be representative of the shell. constructed in parallel to the shell construction if it is not possible to use cut-outs from the shell itself. The parallel shell-sample may be flat or curved.;

**Representative sample** means a sample cut out from the shell;

**Resin infusion** means an FRP construction method by which dry reinforcement is placed into a matched mould, single sided mould with vacuum bag, or otherwise, and liquid resin is supplied to the part through the use of external applied pressure at the inlet and/or application of full or partial vacuum pressure at the vent.

**Structural layer** means FRP layers of a shell required to sustain the design loads;

**Veil** means a thin mat with high absorbency used in FRP product plies where polymeric matrix surplus fraction content is required (surface evenness, chemical resistance, leakage-proof, etc.);

## 6.9.2.2

### General design and construction requirements

#### 6.9.2.2.1

The requirements of 6.7.1 and 6.7.2.2 apply to FRP portable tanks. For areas of the shell that are made from FRP, the following requirements of chapter 6.7 are exempt: 6.7.2.2.1, 6.7.2.2.9.1, 6.7.2.2.13 and 6.7.2.2.14. Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code, applicable to FRP materials, recognized by the competent authority.

In addition, the following requirements apply:

#### 6.9.2.2.2

Manufacturer's quality system

##### 6.9.2.2.2.1

The quality system must contain all the elements, requirements, and provisions adopted by the manufacturer. It must be documented in a systematic and orderly manner in the form of written policies, procedures, and instructions.

##### 6.9.2.2.2.2

The contents must in particular include adequate descriptions of:

- (a) the organizational structure and responsibilities of personnel with regard to design and product quality;
- (b) the design control and design verification techniques, processes, and procedures that will be used when designing the portable tanks;
- (c) the relevant manufacturing, quality control, quality assurance and process operation instructions that will be used;
- (d) quality records, such as inspection reports, test data and calibration data;
- (e) management reviews to ensure the effective operation of the quality system arising from the audits in accordance with 6.9.2.2.2.4;
- (f) the process describing how customer requirements are met;
- (g) the process for control of documents and their revision;
- (h) the means for control of non-conforming portable tanks, purchased components, in-process and final materials; and
- (i) training programmes and qualification procedures for relevant personnel.

#### 6.9.2.2.2.3

Under the quality system, the following minimum requirements must be met for each FRP portable tank manufactured:

- (a) Use of an Inspection and Test Plan (ITP);
- (b) Visual inspections;
- (c) Verification of fibre orientation and mass fraction by means of documented control process;
- (d) Verification of fibre and resin quality and characteristics by means of certificates or other documentation;
- (e) Verification of liner quality and characteristics by means of certificates or other documentation;
- (f) Verification of whichever is applicable of formed thermoplastic resin characteristic or degree of cure of thermoset resin, by direct or indirect means (e.g. Barcol test or differential scanning calorimetry) to be determined in accordance with 6.9.2.7.1.2 (h), or by creep testing of a representative sample or parallel shell-sample in accordance with 6.9.2.7.1.2(e) for a period of 100 hours;
- (g) Documentation of whichever is applicable of thermoplastic resin forming processes or thermoset resin cure and post-cure processes; and
- (h) Retention and archiving of shell samples for future inspection and shell verification (e.g. from manhole cut out) for a period of 5 years.

#### 6.9.2.2.2.4

##### Audit of the quality system

The quality system must be initially assessed to determine whether it meets the requirements in 6.9.2.2.2.1 to 6.9.2.2.2.3 to the satisfaction of the competent authority.

The manufacturer must be notified of the results of the audit. The notification must contain the conclusions of the audit and any corrective actions required.

Periodic audits must be carried out, to the satisfaction of the competent authority, to ensure that the manufacturer maintains and applies the quality system. Reports of the periodic audits must be provided to the manufacturer.

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.9.2.2.2.5 | <p>Maintenance of the quality system</p> <p>The manufacturer must maintain the quality system as approved in order that it remains adequate and efficient.</p> <p>The manufacturer must notify the competent authority that approved the quality system of any intended changes. The proposed changes must be evaluated to determine whether the amended quality system will still satisfy the requirements in 6.9.2.2.2.1 to 6.9.2.2.2.3.</p>                                                                                                                                                                                                                                                                                      |
| 6.9.2.2.3   | FRP Shells                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 6.9.2.2.3.1 | FRP shells must have a secure connection with structural elements of the portable tank frame. FRP shell supports and attachments to the frame must cause no local stress concentrations exceeding the design allowables of the shell structure in accordance with the provisions stated in this chapter for all operating and test conditions.                                                                                                                                                                                                                                                                                                                                                                                      |
| 6.9.2.2.3.2 | Shells must be made of suitable materials, capable of operating within a minimum design temperature range of -40 °C to +50 °C, unless temperature ranges are specified for specific more severe climatic, or operating conditions (e.g. heating elements), by the competent authority of the country where the transport operation is being performed.                                                                                                                                                                                                                                                                                                                                                                              |
| 6.9.2.2.3.3 | <p>If a heating system is installed, it must comply with 6.7.2.5.12 - 6.7.2.5.15 and with the following requirements:</p> <ol style="list-style-type: none"> <li>The maximum operating temperature of the heating elements integrated or connected to the shell must not exceed the maximum design temperature of the tank;</li> <li>The heating elements must be designed, controlled, and utilized so that the temperature of the carried substance cannot exceed the maximum design temperature of the tank or a value at which the internal pressure exceeds MAWP; and</li> <li>Structures of the tank and its heating elements must allow examination of the shell with respect to possible effects of overheating.</li> </ol> |
| 6.9.2.2.3.4 | <p>Shells must consist of the following elements:</p> <ul style="list-style-type: none"> <li>• Liner;</li> <li>• Structural layer;</li> <li>• External layer.</li> </ul> <p><b>NOTE:</b> <i>The elements may be combined if all applicable functional criteria are met.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6.9.2.2.3.5 | <p>The internal liner is the inner element of the shell designed as the primary barrier to provide for the long-term chemical resistance in relation to the substances to be carried, to prevent any dangerous reaction with the contents or the formation of dangerous compounds and any substantial weakening of the structural layer owing to the diffusion of products through the liner. Chemical compatibility must be verified in accordance with 6.9.2.7.1.3.</p> <p>The internal liner may be an FRP liner or a thermoplastic liner.</p>                                                                                                                                                                                   |
| 6.9.2.2.3.6 | FRP liners must consist of the following two components:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

- (a) Surface layer ("gel-coat"): adequate resin rich surface layer, reinforced with a veil, compatible with the resin and contents. This layer must have a maximum fibre mass content of 30% and have a minimum thickness of 0.25 and a maximum thickness of 0.60 mm
- (b) Strengthening layer(s): layer or several layers with a minimum thickness of 2 mm, containing a minimum of 900 g/m<sup>2</sup> of glass mat or chopped fibres with a mass content in glass of not less than 30% unless equivalent safety is demonstrated for a lower glass content.

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.9.2.2.3.7  | <p>If the liner consists of thermoplastic sheets, they must be welded together in the required shape, using a qualified welding procedure and personnel. Welded liners must have a layer of electrically conductive media placed against the non-liquid contact surface of the welds to facilitate spark testing. Durable bonding between liners and the structural layer must be achieved by the use of an appropriate method.</p>                                                                                                                                                                                           |
| 6.9.2.2.3.8  | <p>The structural layer must be designed to withstand the design loads according to 6.7.2.2.12, 6.9.2.2.3.1, 6.9.2.3.2, 6.9.2.3.4 and 6.9.2.3.6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 6.9.2.2.3.9  | <p>The external layer of resin or paint must provide adequate protection of the structural layers of the tank from environmental and service exposure, including to UV radiation and salt fog, and occasional splash exposure to cargoes.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| 6.9.2.2.3.10 | <p><b>Resins</b></p> <p>The processing of the resin mixture must be carried out in compliance with the recommendations of the supplier. These resins can be:</p> <ul style="list-style-type: none"> <li>• Unsaturated polyester resins;</li> <li>• Vinyl ester resins;</li> <li>• Epoxy resins;</li> <li>• Phenolic resins;</li> <li>• Thermoplastic resins.</li> </ul> <p>The resin heat distortion temperature (HDT), determined in accordance with 6.9.2.7.1.1 must be at least 20 °C higher than the maximum design temperature of the shell as defined in 6.9.2.2.3.2, but must in any case not be lower than 70 °C.</p> |
| 6.9.2.2.3.11 | <p><b>Reinforcement material</b></p> <p>The reinforcement material of the structural layers must be selected such that they meet the requirements of the structural layer.</p> <p>For the liner glass fibres of at a minimum type C or ECR according to ISO 2078:1993 + Amendment 1:2015 must be used. Thermoplastic veils may only be used for the liner when their compatibility with the intended contents has been demonstrated.</p>                                                                                                                                                                                      |
| 6.9.2.2.3.12 | <p><b>Additives</b></p> <p>Additives necessary for the treatment of the resin, such as catalysts, accelerators, hardeners and thixotropic substances as well as materials used to improve the tank, such as fillers, colours, pigments etc. must not cause weakening of the material, taking into account lifetime and temperature expectancy of the design.</p>                                                                                                                                                                                                                                                              |

|                |                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.9.2.2.3.13   | FRP shells, their attachments and their service and structural equipment must be designed to withstand the loads mentioned in 6.7.2.2.12, 6.9.2.2.3, 6.9.2.3.2, 6.9.2.3.4 and 6.9.2.3.6 without loss of contents (other than quantities of gas escaping through any degassing vents) during the design lifetime.                      |
| 6.9.2.2.3.14   | Special requirements for the carriage of substances with a flash-point of not more than 60 °C                                                                                                                                                                                                                                         |
| 6.9.2.2.3.14.1 | FRP tanks used for the carriage of flammable liquids with a flash-point of not more than 60 °C must be constructed to ensure the elimination of static electricity from the various component parts to avoid the accumulation of dangerous charges.                                                                                   |
| 6.9.2.2.3.14.2 | The electrical surface resistance of the inside and outside of the shell as established by measurements must not be higher than $10^9 \Omega$ . This may be achieved by the use of additives in the resin or interlaminar conducting sheets, such as metal or carbon network.                                                         |
| 6.9.2.2.3.14.3 | The discharge resistance to earth as established by measurements must not be higher than $10^7 \Omega$ .                                                                                                                                                                                                                              |
| 6.9.2.2.3.14.4 | All components of the shell must be electrically connected to each other and to the metal parts of the service and structural equipment of the tank and to the vehicle. The electrical resistance between components and equipment in contact with each other must not exceed 10 $\Omega$ .                                           |
| 6.9.2.2.3.14.5 | The electrical surface-resistance and discharge resistance must be measured initially on each manufactured tank or a specimen of the shell in accordance with the procedure recognized by the competent authority. In the event of damage to the shell, requiring repair, the electrical resistance must be re-measured.              |
| 6.9.2.2.3.15   | The tank must be designed to withstand, without significant leakage, the effects of a full engulfment in fire for 30 minutes as specified by the test requirements in 6.9.2.7.1.5. Testing may be waived with the agreement of the competent authority, where sufficient proof can be provided by tests with comparable tank designs. |
| 6.9.2.2.3.16   | Construction process for FRP shells:                                                                                                                                                                                                                                                                                                  |
| 6.9.2.2.3.16.1 | Filament winding, hand layup, resin infusion, or other appropriate composite production processes must be used for construction of FRP shells.                                                                                                                                                                                        |
| 6.9.2.2.3.16.2 | The weight of the fibre reinforcement must conform to that set forth in the procedure specification with a tolerance of +10% and -0%. One or more of the fibre types specified in 6.9.2.2.3.11 and in the procedure specification must be used for reinforcement of shells.                                                           |
| 6.9.2.2.3.16.3 | The resin system must be one of the resin systems specified in 6.9.2.2.3.10. No filler, pigment, or dye additions must be used which will interfere with the natural colour of the resin except as permitted by the procedure specification.                                                                                          |

### 6.9.2.3

### Design criteria

#### 6.9.2.3.1

FRP shells must be of a design capable of being stress-analysed mathematically or experimentally by resistance strain gauges, or by other methods approved by the competent authority.

#### 6.9.2.3.2

FRP shells must be designed and constructed to withstand the test pressure. Specific provisions are laid down for certain substances in the applicable portable tank instruction indicated in column 10 of the Dangerous Goods List and described in 4.2.5, or by a portable tank special provision indicated in column 11 of the Dangerous Goods List and described in 4.2.5.3. The minimum wall thickness of the FRP shell must not be less than that specified in 6.9.2.4.

#### 6.9.2.3.3

At the specified test pressure the maximum tensile relative deformation measured in mm/mm in the shell must not result in the formation of microcracks, and therefore not be greater than the first measured point of elongation based fracture or damage of the resin, measured during tensile tests prescribed under 6.9.2.7.1.2(c).

#### 6.9.2.3.4

For internal test pressure, external design pressure specified in 6.7.2.2.10, static loads specified in 6.7.2.2.12 and static gravity loads caused by the contents with the maximum density specified for the design and at maximum filling degree, failure criteria (FC) in the longitudinal direction, circumferential direction, and any other in-plane direction of the composite layup must not exceed the following value:

$$FC \leq \frac{1}{K}$$

Where:  $K = K_0 \times K_1 \times K_2 \times K_3 \times K_4 \times K_5$

Where:

$K$  must have a minimum value of 4.

$K_0$  is a strength factor. For the general design the value for  $K_0$  must be equal to or more than 1.5. The value of  $K_0$  must be multiplied by a factor of two, unless the shell is provided with protection against damage consisting of a complete metal skeleton including longitudinal and transverse structural members;

$K_1$  – a factor related to the deterioration in the material properties due to creep and ageing. It must be determined by the formula:

$$K_1 = \frac{1}{\alpha\beta}$$

where " $\alpha$ " is the creep factor and " $\beta$ " is the ageing factor determined in accordance with 6.9.2.7.1.2(e) and (f), respectively. When used in calculation, factors  $\alpha$  and  $\beta$  must be between 0 and 1.

Alternatively, a conservative value of  $K_1 = 2$  may be applied for the purpose of undertaking the numerical validation exercise in 6.9.2.3.4 (this does not remove the need to perform testing to determine  $\alpha$  and  $\beta$ );

$K_2$  – a factor related to the service temperature and the thermal properties of the resin, determined by the following equation, with a

minimum value of 1:  $K_2 = 1.25 - 0.0125 (HDT - 70)$  where HDT is the heat distortion temperature of the resin, in °C.

$K_3$  - a factor related to the fatigue of the material; the value of  $K_3 = 1.75$  must be used unless otherwise agreed with the competent authority. For the dynamic design as outlined in 6.7.2.2.12 the value of  $K_3 = 1.1$  must be used;

$K_4$  – a factor related to resin curing and has the following values:

1.0 - where curing is carried out in accordance with an approved and documented process, and the quality system described under 6.9.2.2.2 includes verification of degree of cure for each FRP portable tank using a direct measurement approach, such as differential scanning calorimetry (DSC) determined via ISO 11357-2:2016, as per 6.9.2.7.1.2(i);

1.1 - where thermoplastic resin forming or thermoset resin curing is carried out in accordance with an approved and documented process, and the quality system described under 6.9.2.2.2 includes verification of whichever is applicable formed thermoplastic resin characteristics or degree of cure of thermoset resin, for each FRP portable tank using an indirect measurement approach as per 6.9.2.7.1.2(h), such as Barcol testing via ASTM D2583:2013-03 or EN 59:2016, HDT via ISO 75-1:2013, thermo-mechanical analysis (TMA) via ISO 11359-1:2014, or dynamic thermo-mechanical analysis (DMA) via ISO 6721-11:2019;

1.5 - in other cases.

$K_5$  – a factor related to the portable tank instruction from 4.2.5.2.6:

1.0 for T1- T19;

1.33 for T20;

1.67 for T21 to T22.

A design validation exercise using numerical analysis and a suitable composite failure criterion is to be undertaken to verify that the stresses in the plies in the shell are below the allowables. Suitable composite failure criteria include, but are not limited to, Tsai-Wu, Tsai-Hill, Hashin, Yamada-Sun, Strain Invariant Failure Theory, Maximum Strain, or Maximum Stress. Other relations for the strength criteria are allowed upon agreement with the competent authority. The method and results of this design validation exercise are to be submitted to the competent authority.

The allowables are to be determined using experiments to derive parameters required by the chosen failure criteria combined with factor of safety  $K$ , the strength values measured as per 6.9.2.7.1.2(c), and the maximum elongation strain criteria prescribed in 6.9.2.3.5. The analysis of joints is to be undertaken in accordance with the allowables determined under 6.9.2.3.7 and the strength values measured as per 6.9.2.7.1.2(g). Buckling is to be considered in accordance with 6.9.2.3.6. Design of openings and metallic inclusions is to be considered in accordance with 6.9.2.3.8.

## 6.9.2.3.5

At any of the stresses as defined in 6.7.2.2.12 and 6.9.2.3.4, the resulting elongation in any direction must not exceed the value indicated in the following table or one tenth of the elongation at fracture of the resin determined by ISO 527-2:2012, whichever is lower.

Examples of known limits are presented in the table below.

| Type of Resin                     | Maximum strain in tension (%) |
|-----------------------------------|-------------------------------|
| Unsaturated polyester or phenolic | 0.2                           |
| Vinylester                        | 0.25                          |
| Epoxy                             | 0.3                           |
| Thermoplastic                     | See 6.9.2.3.3                 |

## 6.9.2.3.6

For the external design pressure the minimum safety factor for linear buckling analysis of the shell must be as defined in the applicable pressure vessel Code but not less than 3.

## 6.9.2.3.7

The adhesive bondlines and/or overlay laminates used in the joints, including the end joints, connection between the equipment and shell, the joints of the surge plates and the partitions with the shell must be capable of withstanding the loads of 6.7.2.2.12, 6.9.2.2.3.1, 6.9.2.3.2, 6.9.2.3.4 and 6.9.2.3.6. In order to avoid concentrations of stresses in the overlay lamination, the applied taper must not be steeper than 1:6. The shear strength between the overlay laminate and the tank components to which it is bonded must not be less than:

$$\tau = \gamma \frac{Q}{l} \leq \frac{\tau_R}{K}$$

where:

$\tau_R$  - is the interlaminar shear strength according to ISO 14130:1997 and Cor 1:2003;

$Q$  – is the load per unit width of the interconnection;

$K$  – is the safety factor determined as per 6.9.2.3.4;

$l$  – is the length of the overlay laminate

$\gamma$  – is the notch factor relating average joint stress to peak joint stress at failure initiation location

Other calculation methods for the joints are allowed following approval with the competent authority.

## 6.9.2.3.8

Metallic flanges and their closures are permitted to be used in FRP shells, under design requirements of 6.7.2. Openings in the FRP shell must be reinforced to provide at least the same safety factors against the static and dynamic stresses as specified in 6.7.2.2.12, 6.9.2.3.2, 6.9.2.3.4 and 6.9.2.3.6 as that for the shell itself. The number of openings must be minimized. The axis ratio of oval-shaped openings must be not more than 2.

If metallic flanges or componentry are integrated into the FRP shell using bonding, then the characterisation method stated in 6.9.2.3.7 must apply to the joint between the metal and FRP. If the metallic flanges or

componentry are fixed in an alternative fashion, e.g. threaded fastener connections, then the appropriate provisions of the relevant pressure vessel standard must apply.

- 6.9.2.3.9 Check calculations of the strength of the must shall be performed by finite element method simulating the shell layups, joints within FRP shell, joints between the FRP shell and the container frame, and openings. Treatment of singularities must 1be undertaken using an appropriate method according to the applicable pressure vessel code.

#### **6.9.2.4 Minimum wall thickness of shells**

- 6.9.2.4.1 Minimum thickness of the FRP shell must be confirmed by check calculations of the strength of the shell considering strength requirements given in 6.9.2.3.4.

- 6.9.2.4.2 Minimum thickness of the FRP shell structural must shall be determined in accordance with 6.9.2.3.4, however, in any case the minimum thickness of the structural layers must be at least 3 mm.

#### **6.9.2.5 Equipment components for portable tanks with FRP shell.**

Service equipment, bottom openings, pressure relief devices, gauging devices, supports, frameworks, lifting and tie-down attachments of portable tanks must meet the requirements of 6.7.2.5 - 6.7.2.17. If any other metallic features are required to be integrated into the FRP shell, then the provisions of 6.9.2.3.8 must apply.

#### **6.9.2.6 Design approval**

- 6.9.2.6.1 Design approval of FRP portable tanks must be as per 6.7.2.18 requirements. The following additional requirements apply to FRP portable tanks.

- 6.9.2.6.2 The prototype test report for the purpose of the design approval must additionally include the following:

- (a) Results of the material tests used for FRP shell fabrication in accordance with 6.9.2.7.1 requirements;
- (b) Results of the ball drop test in accordance with the requirements of 6.9.2.7.1.4.
- (c) Results the fire resistance test in accordance with provisions of 6.9.2.7.1.5.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.9.2.6.3      | A service life inspection programme must be established, which must be a part of the operation manual, to monitor the condition of the tank at periodic inspections. The inspection programme must focus on the critical stress locations identified in the design analysis performed under 6.9.2.3.4. The inspection method must take into account the potential damage mode at the critical stress location (e.g, tensile stress or inter-laminate stress). The inspection must be a combination of visual and non-destructive testing (e.g., acoustic emissions, ultrasonic evaluation, thermographic). For heating elements the service life inspection programme must allow an examination of the shell or its representative locations to take into account the effects of overheating.                                                                                                                                                                                                                                                                                                                                                                                                 |
| 6.9.2.6.4      | A representative prototype tank must be subjected to tests as specified below. For this purpose service equipment may be replaced by other items if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 6.9.2.6.4.1    | The prototype must be inspected for compliance with the design type specification. This must include an internal and external inspection and measurement of the main dimensions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6.9.2.6.4.2    | <p>The prototype, equipped with strain gauges at all locations of high strain, as identified by the design validation exercise in accordance with 6.9.2.3.4, must be subjected to the following loads and the strain must be recorded:</p> <ul style="list-style-type: none"> <li>(a) Filled with water to the maximum filling degree. The measuring results shall be used to calibrate the design calculations according to 6.9.2.3.4;</li> <li>(b) Filled with water to the maximum filling degree and subjected to static loads in all three directions mounted by the base corner castings without additional mass applied external to the shell. For comparison with the design calculation according to 6.9.2.3.4 the strains recorded must be extrapolated in relation to the quotient of the accelerations required in 6.7.2.2.12 and measured;</li> <li>(c) Filled with water and subjected to the specified test pressure. Under this load, the shell must exhibit no visual damage or leakage.</li> </ul> <p>The stress corresponding to the measured strain level must not exceed the minimum factor of safety calculated in 6.9.2.3.4 under any of these loading conditions.</p> |
| <b>6.9.2.7</b> | <b>Additional provisions applicable to FRP portable tanks</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 6.9.2.7.1      | Material testing:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6.9.2.7.1.1    | <p>Resins</p> <p>Resin tensile elongation must be determined in accordance with ISO 527-2:2012. The heat distortion temperature (HDT) of the resin must be determined in accordance with ISO 75-1:2013.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 6.9.2.7.1.2    | <p>Shell samples</p> <p>Prior to testing all coatings must be removed from the samples. If shell samples are not possible then parallel-shell samples may be used. The tests must cover:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

- (a) Thickness of the laminates of the central shell wall and the ends;
- (b) Mass content and composition of composite reinforcement by ISO 1172:1996 or ISO 14127:2008, as well as orientation and arrangement of reinforcement layers;
- (c) Tensile strength, elongation at fracture and modulus of elasticity according to ISO 527-4:1997 or ISO 527-5:2009 for the circumferential and longitudinal directions of the shell. For areas of the FRP shell, tests must be performed on representative laminates in accordance with ISO 527-4:1997 or ISO 527-5:2009, to permit evaluation of the suitability of safety factor (K). A minimum of 6 specimens per measure of tensile strength must be used, and the tensile strength must be taken as the average minus two standard deviations;
- (d) Bending deflection and strength must be established by the three-point or four-point bending test according to ISO 14125:1998 and Amd 1:2011 using a sample with a minimum width of 50 mm and a support distance of at least 20 times the wall thickness. A minimum of 5 specimens must be used.
- (e) Creep factor  $\alpha$  shall be determined by taking the average result of at least two specimens with the configuration described in (d), subject to creep in three-point or four-point bending at the maximum design temperature nominated under 6.9.2.2.3.2, for a period of 1 000 hours. The following test is to be undertaken for each specimen:
  - (i) Place specimen into bending apparatus, unloaded, in oven set to maximum design temperature and allow to acclimatise for a period of not less than 60 minutes;
  - (ii) Load specimen bending in accordance with ISO 14125:1998 Amd 1:2011 at flexural stress equal to the strength determined in (d) divided by four. Maintain mechanical load at maximum design temperature without interruption for not less than 1 000 hours;
  - (iii) Measure the initial deflection 6 minutes after full load application in (e) (ii). Specimen must remain loaded in test rig;
  - (iv) Measure the final deflection 1 000 hours after full load application in (e) (ii); and.
  - (v) Calculate the creep factor  $\alpha$  by dividing the initial deflection from (e) (iii) by the final deflection from (e) (iv).
- (f) Ageing factor  $\beta$  must be determined by taking the average result of at least two specimens with the configuration described in (d), subject to loading in static three-point or four-point bending in conjunction with immersion in water at the maximum design temperature nominated under 6.9.2.2.3.2 for a period of 1 000 hours. The following test is to be undertaken for each specimen:
  - (i) Prior to testing or conditioning, specimens must be dried in an oven at 80°C for a period of 24 hours;
  - (ii) The specimen must be loaded in three-point or four-point bending at ambient temperature, in accordance with ISO 14125:1998 and Amd 1:2011, at the flexural stress level equal to the strength determined in (d) divided by four. Measure the

- initial deflection 6 minutes after full load application. Remove specimen from test rig;
- (iii) Immerse unloaded specimen in water at the maximum design temperature for a period of not less than 1 000 hours without interruption to the water conditioning period. When conditioning period has lapsed, remove specimens, keep damp at ambient temperature, and complete (f) (iv) within 3 days;
  - (iv) The specimen must be subject to second round of static loading, in a manner identical to (f) (ii). Measure the final deflection 6 minutes after full load application. Remove specimen from test rig; and
  - (v) Calculate the ageing factor  $\beta$  by dividing the initial deflection from (f) (ii) by the final deflection from (f) (iv).
- (g) The interlaminar shear strength of the joints must be measured by testing representative samples in accordance with ISO 14130:1997;
  - (h) The efficiency of whichever is applicable of thermoplastic resin forming characteristics or thermoset resin cure and post-cure processes for laminates are to be determined using one or more of the following methods:
    - (i) Direct measurement formed thermoplastic resin characteristics of or thermoset resin degree of cure: glass transition temperature ( $T_g$ ) or melting temperature ( $T_m$ ) determined using differential scanning calorimetry (DSC) via ISO 11357-2:2016; or
    - (ii) Indirect measurement of formed thermoplastic resin characteristics or thermoset resin degree of cure:
      - HDT via ISO 75-1:2013
      - $T_g$  or  $T_m$  using thermo-mechanical analysis (TMA) via ISO 11359-1:2014
      - Dynamic thermo-mechanical analysis (DMA) via ISO 6721-11:2019
      - Barcol testing via ASTM D2583:2013-03 or EN 59:2016

#### 6.9.2.7.1.3

The chemical compatibility of the liner and chemical contact surfaces of service equipment with the substances to be carried must be demonstrated by one of the following methods. This demonstration must account for all aspects of the compatibility of the materials of the shell and its equipment with the substances to be carried, including chemical deterioration of the shell, initiation of critical reactions of the contents and dangerous reactions between both.

- (a) In order to establish any deterioration of the shell, representative samples taken from the shell, including any liners with welds, must be subjected to the chemical compatibility test according to EN 977:1997 for a period of 1 000 hours at 50 °C or the maximum temperature at which a particular substance is approved for transport. Compared with a virgin sample, the loss of strength and elasticity modulus measured by the bending test according to EN 978:1997 must not exceed 25%. Cracks, bubbles, pitting effects as well as separation of layers and liners and roughness must not be acceptable.

- (b) Certified and documented data of positive experiences on the compatibility of filling substances in question with the materials of the shell with which they come into contact at given temperatures, times and other relevant service conditions.
- (c) Technical data published in relevant literature, standards or other sources, acceptable to the competent authority.
- (d) Upon agreement with the competent authority other methods of chemical compatibility verification may be used.

#### 6.9.2.7.1.4

Ball drop test as per EN 976-1:1997

The prototype must be subjected to the ball drop test according to EN 976-1:1997, No. 6.6. No visible damage inside or outside the tank must occur.

#### 6.9.2.7.1.5

Fire resistance test

#### 6.9.2.7.1.5.1

A representative prototype tank with its service and structural equipment in place and filled to 80% of its maximum capacity with water, must be exposed to a full engulfment in fire for 30 minutes, caused by an open heating oil pool fire or any other type of fire with the same effect. The fire must be equivalent to a theoretical fire with a flame temperature of 800 °C, emissivity of 0.9 and to the tank a heat transfer coefficient of 10 W/(m<sup>2</sup>K) and surface absorptivity of 0.8. A minimum net heat flux of 75 kW/m<sup>2</sup> shall be calibrated according to ISO 21843:2018. The dimensions of the pool shall exceed those of the tank by at least 50 cm to each side and the distance between fuel level and tank must be between 50 cm and 80 cm. The rest of the tank below liquid level, including openings and closures, must remain leakproof except for drips.

### 6.9.2.8

#### Inspection and testing

#### 6.9.2.8.1

Inspection and testing of portable FRP tanks must be carried out as per provisions of 6.7.2.19. In addition, welded thermoplastic liners must be spark tested under a suitable standard, after pressure tests performed in accordance with the periodic inspections specified in 6.7.2.19.4.

#### 6.9.2.8.2

In addition, the initial and periodic inspections must follow the service life inspection programme and any associated inspection methods per 6.9.2.6.3.

#### 6.9.2.8.3

The initial inspection and test must verify that construction of the tank is made in accordance with the quality system required by 6.9.2.2.2.

#### 6.9.2.8.4

Additionally, during inspection of the shell the position of the areas heated by heating elements must be indicated or marked, be available on design drawings or must be made visible by a suitable technique (e.g. infrared). Examination of the shell must take into account the effects of overheating, corrosion, erosion, overpressure and mechanical overloading.

### 6.9.2.9

#### Retention of Samples

Shell samples (e.g. from manhole cut out) for each tank manufactured must be maintained for future inspection and shell verification for a

period of five years from the date of the initial inspection and test and until successful completion of the required periodic five-year inspection.

#### **6.9.2.10**

#### **Marking**

- 6.9.2.10.1 The requirements of 6.7.2.20.1 apply to portable tanks with an FRP shell except those of 6.7.2.20.1 (f) (ii).
- 6.9.2.10.2 The information required in 6.7.2.20.1 (f)(i) must be “Shell structural material: Fibre-reinforced plastic”, the reinforcement fibre e.g. “Reinforcement: E-glass”, and resin e.g. “Resin: Vinyl Ester”.
- 6.9.2.10.3 Requirements of provision 6.7.2.20.2 apply to portable tank with an FRP shell.”

## CHAPTER 6.10: REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION, TESTING AND APPROVAL OF TANK VEHICLES

### 6.10.1 APPLICATION

The requirements of this Chapter apply to road tank vehicles and rail tank wagons intended for the transport of dangerous goods of Classes 2, 3, 4, 5, 6, 8 and 9.

### 6.10.2 REQUIREMENTS FOR TANK VEHICLES

#### 6.10.2.1 Approval of tank designs

6.10.2.1.1 The design of a tank that forms part of or is used on a tank vehicle must be approved by the Competent Authority before it can be used for the transport of dangerous goods.

6.10.2.1.2 An application for design approval of a tank must demonstrate compliance with all of the applicable standards and codes that are relevant to the type of tank and vehicle, and the classes and types of dangerous goods it is intended to transport, as follows:

- (a) for road tank vehicles - the relevant parts of AS 2809, as detailed in Table 6.1;
- (b) for rail tank wagons - such codes or standards as are acceptable to the authority responsible for rail safety<sup>1</sup> and the competent authority;
- (c) for pressure vessels –AS 1210;
- (d) for tanks to transport anhydrous ammonia –AS 2022.

**Table 6.1: Construction standards for road tank vehicles**

| Standard         | Type of dangerous goods                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AS 2809 – Part 1 | Part 1 applies to all road tank vehicles, in addition to the requirements of the applicable Part 2 – 6 according to the type of goods                                                                               |
| AS 2809 – Part 2 | Flammable liquids                                                                                                                                                                                                   |
| AS 2809 – Part 3 | Liquefied compressed gases                                                                                                                                                                                          |
| AS 2809 – Part 4 | Toxic, corrosive or ammonium nitrate emulsion, suspension or gel cargoes<br>The correct Type of tank (1–5)§ under this Part should be selected according to the properties of the dangerous goods to be transported |
| AS 2809 – Part 5 | Bitumen-based products                                                                                                                                                                                              |
| AS 2809 – Part 6 | Cryogenic gases & liquids                                                                                                                                                                                           |
| Table note:      |                                                                                                                                                                                                                     |

<sup>1</sup>Until a recognised Australian standard or national code of practice covering the design of rail tank wagons has been published, it is recommended that tank designs comply with standards applicable in North America or Europe.

§ Where a Type 4 tank is specified by AS 2809 Part 4, a Type 5 tank may also be used.

- 6.10.2.1.3 The Competent Authority may also approve the design of a tank that forms part of, or is used, on a tank vehicle and that does not comply with the relevant requirements specified in 6.10.2.1.2 if –
- (a) the application for design approval of the tank demonstrates compliance with other criteria which are acceptable to the Competent Authority; and
  - (b) the Competent Authority is satisfied that the use of the tank will not result in greater risk than a design that complies with the relevant requirements specified in 6.10.2.1.2.

## **6.10.2.2 Marking**

- 6.10.2.2.1 Every tank vehicle must be fitted with a corrosion resistant metal plate permanently attached to the tank or its mounting in a conspicuous place readily accessible for inspection.

- 6.10.2.2.2 The compliance plate of a road tank vehicle must be in accordance with AS 2809 and 6.10.2.2.3.

- 6.10.2.2.3 A compliance plate fixed to a road tank vehicle or a rail tank wagon must include:

- (a) the name of the manufacturer of the tank;
- (b) the date on which the tank was manufactured;
- (c) the tank serial number;
- (d) the maximum allowable working pressure for the tank;
- (e) the test pressure;
- (f) the metallurgical design temperature of the tank if the temperature is above 50°C or below -20°C;
- (g) the capacity of the tank;
- (h) the maximum mass of dangerous goods that may be transported in the tank under the design approval;
- (i) the maximum gross mass of the tank;
- (j) the name of the Competent Authority who granted the approval and the approval number;
- (k) the initial hydraulic test date and subsequent test dates for the tank;
- (l) the name of the authority or organisation that witnessed the last hydraulic test; and
- (m) if the design approval is based on compliance with an Australian Standard or other standard or code, the standard or code to which the tank or vehicle has been designed.

- 6.10.2.2.4 The details required by 6.10.2.2.3 must be stamped, embossed, engraved or otherwise permanently marked on the compliance plate.

## **6.10.2.3 Inspection and maintenance**

- 6.10.2.3.1 Road tank vehicles must be inspected and maintained in accordance with AS 2809.

- 6.10.2.3.2 Rail tank wagons must be inspected and maintained in accordance with the relevant design standard (see 6.10.2.1.2).

**NOTE:** *Where the tank of a road or rail tank vehicle is also a pressure vessel, it must be maintained, tested and inspected in accordance with AS 3788 and any State or Territory law applicable to pressure vessels.*

## CHAPTER 6.11: SEGREGATION DEVICES

**NOTE 1:** Segregation devices may only be used to facilitate the transport of incompatible goods where permitted by Section 9.2.2.

**NOTE 2:** Requirements for packing, using, marking and labelling of segregation devices are in Section 4.4.5.

### 6.11.1

#### TYPES OF SEGREGATION DEVICES

A segregation device may be:

- (a) an Overpacking Drum Segregation Device as described in 6.11.2; or
- (b) a Type I Segregation Device as detailed in 6.11.3; or
- (c) a Type II Segregation Device in accordance with 6.11.4, used in accordance with an approval issued by the Competent Authority in 6.11.6; or
- (d) a Non-Type I Underslung Segregation Device.

### 6.11.2

#### OVERPACKING DRUM SEGREGATION DEVICE

A removable head drum may be used as an Overpacking Drum Segregation Device provided the drum is:

- (a) an approved drum for dangerous goods transport (Type Designator 1A2, 1B2 or 1H2), meeting the appropriate requirements of Chapter 6.1; and
- (b) securely closed with its approved lid and closure.

### 6.11.3

#### TYPE I SEGREGATION DEVICE

#### 6.11.3.1

A Type I Segregation Device must not exceed 450 litres in capacity. It need not be performance tested.

#### 6.11.3.2

The device must be rigid, of substantial construction, liquid tight, with a permanently attached hinged lid and at least two suitable closing devices.

#### 6.11.3.3

The device must be fixed to the vehicle by bolting, clamping or other suitable means and must not be lifted onto or from the vehicle when filled.

#### 6.11.3.4

The interior of the Segregation Device must be smooth and free of any protrusion or fitting likely to cause damage to the packages within. It must allow for easy cleaning and be free of any cavities wherein spillage, dirt or contaminants might collect.

### 6.11.4

#### TYPE II SEGREGATION DEVICE

#### 6.11.4.1

A Type II Segregation Device must be design-type approved in accordance with this sub-section. Each design type must be capable of successfully passing the design type tests specified in 6.11.5 and be approved by the Competent Authority.

#### 6.11.4.2

##### General requirements

##### 6.11.4.2.1

A Type II Segregation Device must not exceed 3000 litres in capacity.

- 6.11.4.2.2 A Type II Segregation Device may include a packaging, a large packaging, a tank, an Intermediate Bulk Container or a freight container provided it meets the requirements of this sub-section and is approved by the Competent Authority.
- 6.11.4.2.3 In approving a Type II Segregation Device, the Competent Authority may restrict the use of a particular device to certain specified dangerous goods or specified classes of dangerous goods.

### **6.11.4.3 Design and construction requirements**

- 6.11.4.3.1 The segregation device must be of suitable design, construction, materials and strength for the intended service.
- 6.11.4.3.2 All body panels must be solid, substantial and resistant to penetration. Mesh, crate construction or similar is not acceptable but mesh reinforcing layers may be used. The body and panels must be resistant to or adequately protected from environmental deterioration.
- 6.11.4.3.3 The segregation device may be of fixed construction or may be designed to be folded, dismantled or collapsed for return transport.
- 6.11.4.3.4 The device must incorporate a base (which may also function as a lifting device) which raises the floor of the device at least 100mm above the floor of the transport vehicle at all times.
- 6.11.4.3.5 The segregation device must be designed for safe mechanical handling when fully loaded.
- 6.11.4.3.6 If intended to be stacked the device must be designed for safe stacking and be sufficiently strong to support the load imposed by similar devices to the maximum height likely to occur in transport.
- 6.11.4.3.7 The segregation device must be able to be restrained on or attached to the transport vehicle. Restraint components must be of sufficient strength to securely restrain the device when it is loaded to twice the approved gross load. Restraints must be of a type and so positioned that no distortion or undue stress is imposed on the device.
- 6.11.4.3.8 The interior of the segregation device must be smooth and free of any protrusion or fitting likely to cause damage to the packages transported within. It must allow for cleaning and be free of any cavities in which spillage, dirt or contaminants may collect.
- 6.11.4.3.9 Each type of segregation device must be designed, manufactured and tested under a quality assurance program in order to ensure that each meets the requirements of this Code.

### **6.11.5 DESIGN TYPE TESTS FOR TYPE II SEGREGATION DEVICES**

- 6.11.5.1 The tests to which Type II Segregation Devices must be subjected are those specified for Large Packagings in Chapter 6.6, except that:
- (a) the preparation for testing must be in accordance with 6.11.5.7; and
  - (b) irrespective of the intended contents, the drop height must be based on the requirements for packing group III.
- 6.11.5.2 Subject to 6.11.5.9, tests must be carried out on a segregation device design-type as it would be prepared for transport.

6.11.5.3 One Type II Segregation Device of each type, size and manner of construction must be subjected to the tests specified in order in the table below, as set out in the clauses indicated in the table.

| Test                                                                                                                      | Reference Clause | Applicability |
|---------------------------------------------------------------------------------------------------------------------------|------------------|---------------|
| Bottom Lift                                                                                                               | 6.6.5.3.1        | requireda     |
| Top Lift                                                                                                                  | 6.6.5.3.2        | requireda     |
| Stacking                                                                                                                  | 6.6.5.3.3        | requiredb     |
| Drop                                                                                                                      | 6.6.5.3.4        | required      |
| Table notes:<br>a. When the device is designed for this means of lifting<br>b. When the device is designed to be stacked. |                  |               |

6.11.5.4 A segregation device must be design type tested to a minimum rating of 0.75 kg per litre of available capacity. The person submitting the segregation device for approval must nominate any higher test rating required, before testing is initiated.

6.11.5.5 These tests must be repeated after each modification which significantly alters the design, material or manner of construction of the device.

6.11.5.6 The Competent Authority may at any time require proof, by tests in accordance with this section, that a Type II Segregation Device meets the requirements of the design type tests.

#### 6.11.5.7 The design type tests must be performed:

- (a) by a testing laboratory registered by the National Association of Testing Authorities (NATA) for the relevant tests and the results reported on a NATA endorsed test certificate;
- (b) by a testing laboratory located overseas and recognised by the Competent Authority; or
- (c) where no such laboratory is available, at a suitable facility where the tests are supervised by a representative witnesses from the Competent Authority and the results are reported on a test certificate in accordance with the ADG Code.

6.11.5.8 The Competent Authority may permit the selective testing of segregation devices which differ only in minor aspects from the tested design type.

#### 6.11.5.9 Preparation of Test Samples

6.11.5.9.1 Liner Bag

A 70-micron linear low-density polyethylene bag must be inserted into the test sample. The liner bag may be a pillow or gusseted bag of the following dimensions:

For pillow bags:

Length =  $H + 1.5 W$

Width =  $1.2 (L + W)$

For gusseted bags:

$$\text{Length} = H + 1.5W$$

$$\text{Width} + \text{Gusset Width} = 1.2 (L + W)$$

Where:

L = Length of Segregation Device in metres

W = Width of Segregation Device in metres

H = Height of Segregation Device in metres

#### 6.11.5.9.2

##### Filling Material

High flow plastic granules of approximately 0.75kg/L bulk density are to be used as the bulk filling material. For lift tests it is permissible to use additives such as bags of lead shot to achieve the requisite total contained mass with the condition that they are placed so that the test results are not affected in any way.

#### 6.11.5.9.3

##### Filling

The Segregation Device is to be filled so that the filling material occupies not less than 95% of the total volume of the test sample (see 6.11.5.4).

### 6.11.6

#### MARKING

Each Type II Segregation Device manufactured in accordance with an approved design-type must be clearly and permanently marked on each side in lettering not less than 25mm high with the identification:

“AUSTRALIAN COMPETENT AUTHORITIES APPROVED  
SEGREGATION DEVICE FOR USE IN AUSTRALIA ONLY APPROVAL  
XXX TARE YYY GROSS ZZZ”

Where:

XXX is the unique number issued by the Competent Authority

YYY is the Tare Mass of the segregation device

ZZZ is the maximum permitted gross mass of the segregation device and contents

### 6.11.7

#### NON-TYPE I UNDERSLUNG SEGREGATION DEVICE

#### 6.11.7.1

Any proposed underslung segregation device (which is not a Type I device) submitted for approval must comply with the requirements in this subsection and must be approved by the Competent Authority.

#### 6.11.7.2

##### Design and construction requirements

#### 6.11.7.2.1

The device must be designed to a maximum design load and be built with sufficient strength and rigidity to transport the maximum design load without failure or such distortion as would compromise any of the device's function or features.

#### 6.11.7.2.2

The device must be fitted with a permanently attached door and be liquid tight.

#### 6.11.7.2.3

The device must have a door fitted with at least 2 securing devices and be capable of being locked against unauthorised access.

- 6.11.7.2.4 The device must be permanently attached to the vehicle to withstand a 2g force in any direction when loaded to its maximum design load.
- 6.11.7.2.5 The device must have a smooth interior free of any protrusion or fitting likely to damage packages within.
- 6.11.7.2.6 The device must be easy to clean and free from cavities where spillage or dirt or contaminants might collect.
- 6.11.7.2.7 The device must have a means of draining any liquid from the device which may accumulate due to leakage of any contents. When the device is in use the drainage facility must be tightly sealed.
- 6.11.7.2.8 The device, including supports and attachments, must have a ground clearance of at least 350mm and not project beyond the perimeter of the vehicle.

### **6.11.7.3 Application for approval**

- 6.11.7.3.1 An application for the approval of a Competent Authority of a proposed underslung segregation device must be in writing and must include:
- (a) a full description of the device;
  - (b) details of the dimensions, volumetric capacity and maximum design load (kg) of the device;
  - (c) signed detailed drawings of the device;
  - (d) details of the materials used in the device;
  - (e) details of the construction of the device;
  - (f) details of how the device is to be attached to the vehicle;
  - (g) any other information necessary to enable an assessment of whether the device complies with 6.11.7.2.

### **6.11.7.4 Approval number to be displayed**

- 6.11.7.4.1 An approved underslung segregation device must be clearly and permanently marked, in a conspicuous position, in lettering not less than 25mm high with the following:
- (a) for a device approved by a Competent Authority:  
 Name of Competent Authority  
 APPROVED SEGREGATION DEVICE  
 FOR USE IN (State/Territory) ONLY  
 APPROVAL XXX DESIGN LOAD YYY
  - (b) for a device approved by the Competent Authorities Panel:  
 AUSTRALIAN COMPETENT AUTHORITIES  
 APPROVED SEGREGATION DEVICE  
 FOR USE IN AUSTRALIA ONLY  
 AP REFERENCE CA20--/----  
 DESIGN LOAD YYY
- where: XXX is the approval number issued by the Competent Authority  
 YYY is the maximum weight, in kg, that the device may carry."

## CHAPTER 6.12: FREIGHT CONTAINERS

### 6.12.1

#### STANDARDS FOR FREIGHT CONTAINERS

A freight container used to transport dangerous goods must comply with:

- (a) the standards specified in AS/NZS 3711 relating to the construction, maintenance and use of freight containers; or
- (b) the standards specified by ISO for freight containers used to transport dangerous goods.

**NOTE:** *Freight containers intended for transport by sea must comply with the International Convention for Safe Containers.*

# **PART 7**

## **PROVISIONS CONCERNING TRANSPORT OPERATIONS**

## Introductory Note

### **In UN23:**

*Chapter 7.1 contains operational provisions that are applicable to all modes of transport, covering:*

- (a) general provisions for transporting, offering and accepting for transport;
- (b) new requirements for carrying and retaining documentation;
- (c) loading requirements, including new provisions for loading and restraining flexible bulk containers;
- (d) segregation of dangerous goods;
- (e) special provisions applicable to some types of dangerous goods; and
- (f) reporting of accidents and incidents.

*Chapter 7.2 is “generally reserved for additional provisions applicable to the individual modes of transport that may be added by national, modal or regional authorities.” It includes special provisions for:*

- (g) transport of portable tanks on vehicles
- (h) transport of radioactive material
- (i) security of transport by road, rail or inland waterway

### **In this Code:**

*Chapter 7.1 includes only (a) and (e) of the above.*

- (b) is covered in Chapter 11.1.
- (c) is covered in Chapter 8.1 which, in this Code, covers all stowage provisions.
- (d) is covered in Part 9, that includes all compatibility and segregation issues.
- (f) is not covered by this Code as it is addressed by the Regulations.

*Australian specific special provisions that are applicable to particular types of dangerous goods have also been included in Chapter 7.1 so that all such provisions are grouped together.*

*Chapter 7.2 contains only special provisions for the transport of nominally empty storage vessels. The content of (g) above has been covered in Chapter 8.2. Neither (h) nor (i) are included in this Code, being subject to other legislation.*

## CHAPTER 7.1: TRANSPORT PROVISIONS

**NOTE 1:** Chapter 7.1 of UN23 is headed “Provisions Concerning Transport Operations by all Modes of Transport”.

**NOTE 2:** Additional general transport provisions may also exist in the Regulations. Among other things, there may be requirements concerning the retention of transport documents for specified periods.

### 7.1.1 GENERAL PROVISIONS

#### 7.1.1.1 Reserved

- 7.1.1.2 Unless otherwise specified in this Code, dangerous goods must not be offered for transport unless:
- (a) the goods have been properly classified, packed, marked, labelled and described on a dangerous goods transport document; and
  - (b) the goods are in a fit condition for transport as required by this Code, and no dangerous residue of the dangerous goods adheres to the outside of the package.

#### 7.1.1.3 Reserved

**NOTE:** 7.1.1.3 of UN23 has documentation requirements that are covered by Chapter 11.1 of this Code.

- 7.1.1.4 Unless otherwise specified in this Code, dangerous goods must not be transported unless:
- (a) cargo transport units have been appropriately marked, labelled and placarded; and
  - (b) cargo transport units are otherwise in a condition for transport as required by this Code.

#### 7.1.1.5 - 7.1.1.11 Reserved

**NOTE:** 7.1.1.5—7.1.1.10 of UN23 deals briefly with loading, segregating and restraining of packages of dangerous goods in cargo transport units. These provisions have been incorporated into Chapter 8.1 and Part 9 of this Code. 7.1.1.11 of UN23 has provisions for the loading of flexible bulk containers that, for consistency, have been relocated to Chapter 8.1.

- 7.1.1.12 If a cargo transport unit, pressure drum, MEGC or IBC is marked with notations indicating how it should be handled in the transport of dangerous goods, it must be handled in accordance with those notations.

### 7.1.2 RESERVED

**NOTE:** Section 7.1.2 of UN23 deals briefly with the principles of segregating incompatible dangerous goods. Part 9 of this Code provides detailed requirements for segregating and separating dangerous goods when transported by road or rail in Australia.

### 7.1.3 RESERVED

**NOTE:** Section 7.1.3 of UN23 contains special provisions applicable to the transport of explosives. Refer to the Australian Explosives Code.

### 7.1.4 SPECIAL PROVISIONS APPLICABLE TO THE TRANSPORT OF GASES

**NOTE:** Refer to Safety Data Sheets for detailed safety information about particular dangerous goods.

7.1.4.1 Aerosols transported for the purposes of reprocessing or disposal under the provisions of Special Provision 327 must only be transported in well-ventilated cargo transport units as described in 7.1.4.5.

7.1.4.2 Dangerous goods of Class 2 must not be stowed near a source of heat.

7.1.4.3 If liquefied gas is transported in a cylinder fitted with a pressure relief device and the venting of the liquid would create a risk greater than the venting of the gas, the cylinder must be stowed so that the pressure relief device communicates with the vapour space

7.1.4.4 When transporting gases in cylinders, the main cylinder valve must always be shut and any regulator removed prior to loading.

7.1.4.5 Ventilation

The following dangerous goods must not be transported in a placard load unless the cargo transport unit or compartment in which they are transported is ventilated to prevent the build-up of vapours that are likely to increase risk:

- (a) dangerous goods [other than aerosols (UN 1950) and gas cartridges (UN 2037)] of Division 2.1 or 2.3, or subsidiary hazard of 2.1; or
- (b) liquefied oxygen.

The ventilation must produce a flow of air that circulates throughout the unit or compartment, in particular through the highest and lowest parts of the unit or compartment, and must provide for the air to be released from the unit or compartment after it has circulated. However the requirements in the previous sentence do not apply in the case of a shipping container that is being used:

- (a) to import those goods if appropriate measures are taken to check for vapours before the container is opened, and to be able to deal, when the container is opened, with any build-up of vapours that may have occurred; and
- (b) to export those goods if the container will be accepted for carriage by sea or air without needing to comply with those requirements.

7.1.4.6 Transport of LP Gas on buses <sup>1</sup>

LP Gas in cylinders must not be transported on a bus unless:

- (a) no LP Gas cylinder individually has a capacity of more than 2.5 litres; and

---

<sup>1</sup>For transport of dangerous goods on passenger trains, see 9.2.4.7.

(b) the total quantity of LP Gas on the bus is less than 250 litres.

## 7.1.5

### **SPECIAL PROVISIONS APPLICABLE TO THE TRANSPORT OF SELF-REACTIVE SUBSTANCES OF DIVISION 4.1, ORGANIC PEROXIDES OF DIVISION 5.2 AND SUBSTANCES STABILIZED BY TEMPERATURE CONTROL (OTHER THAN SELF-REACTIVE SUBSTANCES AND ORGANIC PEROXIDES)**

#### 7.1.5.1

All self-reactive substances, organic peroxides and polymerizing substances must be protected from direct sunlight and all sources of heat, and placed in adequately ventilated areas.

**NOTE:** *Some substances which are transported under temperature control are prohibited from transport by certain modes*

#### 7.1.5.2

Where a number of packages are assembled in a freight container, closed road vehicle or unit load, the total quantity of substance, the type and number of packages and the stacking arrangement shall not create an explosion hazard.

#### 7.1.5.3

### **Temperature control provisions**

##### 7.1.5.3.1

These provisions apply to certain self-reactive substances when required by 2.4.2.3.4, and certain organic peroxides when required by 2.5.3.4.1 and certain polymerizing substances when required by 2.4.2.5.2 or special provision 386 of Chapter 3.3 which may only be transported under conditions where the temperature is controlled

##### 7.1.5.3.2

These provisions also apply to the transport of substances for which:

- (a) The proper shipping name as indicated in column 2 of the Dangerous Goods List of Chapter 3.2 or according to 3.1.2.6 contains the word "TEMPERATURE CONTROLLED"; and
- (b) The self-accelerating decomposition temperature (SADT) or the self-accelerating polymerisation temperature (SAPT) determined for the substance (with or without chemical stabilization) as offered for transport is:
  - (i) 50 °C or less for single packagings and IBCs; or
  - (ii) 45 °C or less for portable tanks.

When chemical inhibition is not used to stabilize a reactive substance which may generate dangerous amounts of heat and gas, or vapour, under normal transport conditions, these substances need to be transported under temperature control. These provisions do not apply to substances which are stabilized by the addition of chemical inhibitors such that the SADT or the SAPT is greater than that prescribed in (b) (i) or (ii), above.

##### 7.1.5.3.3

In addition, if a self-reactive substance or organic peroxide or a substance the proper shipping name of which contains the word "STABILIZED" and which is not normally required to be transported under temperature control is transported under conditions where the temperature may exceed 55 °C, it may require temperature control.

7.1.5.3.4 The “control temperature” is the maximum temperature at which the substance can be safely transported. It is assumed that during transport the temperature of the immediate surroundings of the package does not exceed 55 °C and attains this value for a relatively short time only during each period of 24 hours. In the event of loss of temperature control, it may be necessary to implement emergency procedures. The “emergency temperature” is the temperature at which such procedures shall be implemented.

7.1.5.3.5 Derivation of control and emergency temperatures

| Type of receptacle                                                             | SADTa/SAPTa                                        | Control temperature                                                     | Emergency temperature                                                  |
|--------------------------------------------------------------------------------|----------------------------------------------------|-------------------------------------------------------------------------|------------------------------------------------------------------------|
| Single packagings and IBCs                                                     | 20 °C or less<br>> 20 °C and < 35 °C<br>over 35 °C | 20 °C below SADT/SAPT<br>15 °C below SADT/SAPT<br>10 °C below SADT/SAPT | 10 °C below SADT/SAPT<br>10 °C below SADT/SAPT<br>5 °C below SADT/SAPT |
| Portable tanks                                                                 | < 45 °C                                            | 10 °C below SADT/SAPT                                                   | 5 °C below SADT/SAPT                                                   |
| Table note:<br>a. i.e. the SADT/SAPT of the substance as packed for transport. |                                                    |                                                                         |                                                                        |

7.1.5.3.6 The control and emergency temperatures are derived using the table in 7.1.5.3.5 from the SADT or from the SAPT which are defined as the lowest temperatures at which self-accelerating decomposition or self-accelerating polymerization may occur with a substance in the packaging, IBC or portable tank as used in transport. An SADT or SAPT shall be determined in order to decide if a substance shall be subjected to temperature control during transport. Provisions for the determination of the SADT and SAPT are given in 2.4.2.3.4, 2.5.3.4.2 and 2.4.2.5.2 for self-reactive substances, organic peroxides and polymerizing substances and mixtures, respectively.

7.1.5.3.7 Control and emergency temperatures, where appropriate, are provided for currently assigned self-reactive substances in 2.4.2.3.2.3 and for currently assigned organic peroxide formulations in 2.5.3.2.4.

7.1.5.3.8 The actual transport temperature may be lower than the control temperature but shall be selected so as to avoid dangerous separation of phases

## 7.1.5.4 Transport under temperature control

**NOTE:** *Since the circumstances to be taken into account differ for the various modes of transport, only general guidance is provided.*

7.1.5.4.1 Maintenance of the prescribed temperature is an essential feature of the safe transport of substances stabilized by temperature control. In general, there must be:

- (a) Thorough inspection of the cargo transport unit prior to loading;
- (b) Instructions to the carrier about the operation of the refrigeration system;
- (c) Procedures to be followed in the event of loss of control;
- (d) Regular monitoring of operating temperatures; and
- (e) Provision of a back-up refrigeration system or spare parts.

#### 7.1.5.4.2

Any control and temperature sensing devices in the refrigeration system must be readily accessible and all electrical connections weather-proof. The temperature of air space within the cargo transport unit must be measured by two independent sensors and the output must be recorded so that temperature changes are readily detectable. The temperature shall be checked every four to six hours and logged. When substances having a control temperature of less than +25 °C are carried, the cargo transport unit must be equipped with visible and audible alarms, powered independently of the refrigeration system, set to operate at or below the control temperature.

#### 7.1.5.4.3

If during transport the control temperature is exceeded, an alert procedure must be initiated involving any necessary repairs to the refrigeration equipment or an increase in the cooling capacity (e.g. by adding liquid or solid refrigerants). The temperature must also be checked frequently and preparations made for implementation of the emergency procedures. If the emergency temperature is reached, the emergency procedures must be initiated.

#### 7.1.5.4.4

The suitability of a particular means of temperature control for transport depends on a number of factors. Factors to be considered include:

- (a) The control temperature(s) of the substance(s) to be transported;
- (b) The difference between the control temperature and the anticipated ambient temperature conditions;
- (c) The effectiveness of the thermal insulation;
- (d) The duration of transport; and
- (e) Allowance of a safety margin for delays.

#### 7.1.5.4.5

Suitable methods for preventing the control temperature being exceeded are, in order of increasing control capability:

- (a) Thermal insulation; provided that the initial temperature of the substance(s) to be transported is sufficiently below the control temperature;
- (b) Thermal insulation with coolant system; provided that:
  - (i) An adequate quantity of coolant (e.g. liquid nitrogen or solid carbon dioxide), allowing a reasonable margin for delay, is carried;
  - (ii) Liquid oxygen or air is not used as coolant;
  - (iii) There is a uniform cooling effect even when most of the coolant has been consumed; and
  - (iv) The need to ventilate the unit before entering is clearly indicated by a warning on the door(s) of the unit;
- (c) Single mechanical refrigeration; provided that for substance(s) to be transported with a flash point lower than the sum of the emergency temperature plus 5 °C explosionproof electrical fittings are used

- within the cooling compartment to prevent ignition of flammable vapours;
- (d) Combined mechanical refrigeration system with coolant system; provided that:
    - (i) The two systems are independent of one another;
    - (ii) The provisions in (b) and (c) are complied with;
  - (e) Dual mechanical refrigeration system; provided that:
    - (i) Apart from the integral power supply unit, the two systems are independent of one another;
    - (ii) Each system alone is capable of maintaining adequate temperature control; and
    - (iii) For substance(s) to be transported with a flash point lower than the sum of the emergency temperature plus 5 °C explosion-proof electrical fittings are used within the cooling compartment to prevent ignition of flammable vapours.

## 7.1.6

## RESERVED

## 7.1.7

## SPECIAL PROVISIONS APPLICABLE TO THE TRANSPORT OF DIVISION 6.1 (TOXIC) AND DIVISION 6.2 (INFECTIOUS) SUBSTANCES

**NOTE:** *Separation from foodstuffs is addressed in Part 9 of this Code.*

### 7.1.7.1

### Division 6.1 (toxic) substances

#### 7.1.7.1.1

Reserved

**NOTE:** *Carrier responsibilities are assigned by the Regulations.*

#### 7.1.7.1.2

Decontamination of cargo transport units

A rail wagon, road vehicle, freight container or other cargo transport unit which has been used to carry substances marked as or known to be toxic (packing groups I, II and III) must, after unloading and before removal of placards, be inspected for contamination. Until such contamination has been removed, a cargo transport unit which has been contaminated must not be returned to service and placards and other markings indicating the presence of the dangerous goods must not be removed.

### 7.1.7.2

### Division 6.2 (infectious) substances

#### 7.1.7.2.1

Reserved

**NOTE:** *Decontamination of the transport unit is addressed by other legislation.*

#### 7.1.7.2.2

Action to be taken in the event of damage or leakage

Any person responsible for the carriage of packages containing infectious substances who becomes aware of damage to or leakage from such packages must:

- (a) avoid handling the package or keep handling to a minimum;
- (b) Inspect adjacent packages for contamination and put aside any that may have been contaminated;

- (c) inform emergency services, the appropriate public health authority or veterinary authority, and provide information on any other jurisdictions of transit where persons may have been exposed to danger; and
- (d) notify the consignor and/or the consignee.

7.1.7.2.3

Reserved

**NOTE:** *Decontamination of the transport unit is addressed by other legislation.*

7.1.8

### **RESERVED**

**NOTE:** *Section 7.1.8 of UN23 contains special provisions applicable to the transport of radioactive material. Refer to the Code of Practice for the Safe Transport of Radioactive Substances.*

7.1.9

### **RESERVED**

**NOTE:** *Section 7.1.9 of UN23 contains reporting requirements for accidents and incidents. These are dealt with in Part 14 of the Regulations.*

7.1.10

### **RESERVED**

**NOTE:** *Section 7.1.10 of UN23 imposes obligations for the retention and reproduction of documentation and associated information. Obligations relating to retention of documentation can be found in Chapter 11.1 of the Code and Regulation 11.1.8.*

7.1.11

### **SPECIAL PROVISIONS APPLICABLE TO THE TRANSPORT OF DIVISION 4.3**

Dangerous goods of Division 4.3, or with a Subsidiary Hazard of 4.3 must be kept dry during transport.

**NOTE:** *Refer to Safety Data Sheets for detailed safety information about particular dangerous goods.*

## CHAPTER 7.2: TRANSPORT OF NOMINALLY EMPTY STORAGE VESSELS

**NOTE:** Chapter 7.2 of UN23 is headed “Modal Provisions”.

### 7.2.1 APPLICATION

The provisions of this Chapter apply only to road and rail transport in Australia.

### 7.2.2 RESERVED

**NOTE:** The content of Section 7.2.2 which, in UN23 is headed “Special Provisions applicable to the Transport of Portable Tanks on Vehicles”, has been relocated to Section 8.2.2 in Chapter 8.2 of this Code, along with other transport unit restraint requirements.

### 7.2.3 RESERVED

**NOTE:** Section 7.2.3 of UN23 applies to the transport of radioactive material by road and rail. See the Code of Practice for the Safe Transport of Radioactive Substances.

### 7.2.4 RESERVED

**NOTE:** Section 7.2.4 of UN23 relates to security measures which are addressed in Australia by other legislation.

### 7.2.5 DELETED

### 7.2.6 DELETED

### 7.2.7 TRANSPORT OF NOMINALLY EMPTY STORAGE VESSELS

**NOTE:** This section does not apply to packagings, cylinders, pressure drums, IBCs, demountable tanks, portable tanks, bulk containers or MEGCs that are transported in accordance with this Code.

7.2.7.1 This Section applies to the transport of nominally empty tanks or hoppers that have been used in fixed underground or above ground installations for the storage of LP Gas, or any other dangerous goods except:

- (a) Classes 1 and 7; and
- (b) Division 2.1 (other than LP Gas), Divisions 2.3, 5.2, and 6.2; and
- (c) Self-reactive substances or desensitised explosives of Division 4.1; and
- (d) Desensitised explosives of Class 3; and
- (e) Packing group I of any Class or Division; and
- (f) Goods too dangerous to be transported.

**NOTE:** *Storage tanks and hoppers that have been cleaned so as to be free from dangerous goods are not subject to this Code.*

- 7.2.7.2 Prior to transport, tanks and hoppers described in 7.2.7.1 must:
- (a) be deemed structurally sound for that purpose; and
  - (b) have any holes repaired in such a way as will prevent any leakage of solid, liquid or vapour during transport; and
  - (c) be drained as far as is practicable to minimise residual dangerous goods; and
  - (d) except as required for pressure equalisation and safety valves on pressure vessels, have all pipework capped; and
  - (e) if gas tanks, be free from leaks.
- 7.2.7.3 Nominally empty storage vessels transported according to this Section must be secured to the vehicle in accordance with the Load Restraint Guide.
- 7.2.7.4 Vehicles transporting nominally empty storage vessels must be placarded as required by Chapter 5.3 of this Code for a vehicle transporting the particular dangerous goods in a portable tank.
- 7.2.7.5 Transport documentation complying with Chapter 11.1 and emergency information complying with Chapter 11.2 must be carried in the cabin of the vehicle transporting the nominally empty vessel.
- 7.2.7.6 Nominally empty storage vessels must be segregated from other dangerous goods in accordance with Chapter 9.2.
- 7.2.7.7 Vehicles transporting nominally empty storage vessels in accordance with this Section must carry safety equipment specified for the dangerous goods in Part 12.
- 7.2.7.8 An exemption or determination must be obtained from the Competent Authority before transporting, other than in accordance with this Section, tanks and other previously fixed receptacles or containers that have been used for the storage of dangerous goods and are not free from dangerous goods.

## **CHAPTER 7.3: Reserved**

# **PART 8**

## **STOWAGE AND RESTRAINT**

## CHAPTER 8.1: STOWAGE AND RESTRAINT ON OR IN CARGO TRANSPORT UNITS

### 8.1.1 APPLICATION

8.1.1.1 This chapter applies to the stowage into cargo transport units, and the restraint of packages, overpacks, large packagings, IBCs, cylinders, MEGCs and flexible bulk containers containing dangerous goods and unpackaged dangerous articles that together constitute a placard load.

8.1.1.2 Where requirements are assigned in this chapter to 'packages', they apply to packagings containing dangerous goods. They must equally be applied to overpacks, large packagings, segregation devices, IBCs, cylinders and MEGCs containing dangerous goods, and to unpackaged dangerous articles.

**NOTE 1:** *Special provisions relating to the packing, stowage and restraint of particular dangerous goods may be found in Part 7, or in detailed packing instructions in Chapter 4.1, as referenced in Columns (8) and (9) of the Dangerous Goods List in Chapter 3.2.*

**NOTE 2:** *Additional guidance on the packing of cargo transport units can be found in the Load Restraint Guide and in the IMO/ILO/UNECE Guidelines for Packing Cargo Transport Units (CTUs) contained in the supplement to the IMDG Code.*

**NOTE 3:** *Requirements for restraining portable cargo transport units are in Chapter 8.2.*

### 8.1.2 GENERAL REQUIREMENTS FOR STOWAGE AND RESTRAINT

8.1.2.1 Packages containing dangerous goods must only be loaded in cargo transport units which are strong enough to withstand the shocks and loadings normally encountered during transport, having regard to the conditions to be expected during the anticipated journey. The cargo transport unit must be constructed in such a way as to prevent the loss of contents. Where appropriate the cargo transport unit must be fitted with devices to facilitate securing and handling of the dangerous goods. [UN 7.1.1.5]

8.1.2.2 The interior and exterior of a cargo transport unit must be inspected prior to loading to ensure that there is no damage that could affect its integrity or that of the packages to be loaded in it. [UN 7.1.1.6]

8.1.2.3 Packages must be stowed and restrained in the cargo transport unit so as to meet the performance standards specified in the Load Restraint Guide.

- 8.1.2.4 Cargo transport units must be loaded so that incompatible dangerous or other goods are segregated in accordance with Chapter 9.2. Specific loading instructions such as orientation arrows, not to be double stacked, keep dry or temperature control requirements must be met. Liquid dangerous goods should be loaded below dry dangerous goods whenever possible. [UN 7.1.1.7]
- 8.1.2.5 Packages containing dangerous goods and unpackaged articles must be restrained by suitable means (such as fastening straps, sliding slat-boards, adjustable brackets) in the cargo transport unit in a manner that will prevent any movement during transport which would change the orientation of the packages or cause them to be damaged. Movement of packages may also be prevented by filling any voids by the use of dunnage or by blocking and bracing. Where restraints such as banding or straps are used, these must not be over-tightened to cause damage or deformation of the package.
- When dangerous goods are transported with other goods, all goods must be restrained in the cargo transport units so as to prevent the release of dangerous goods. Packages must be stowed and restrained so as to prevent damage to other goods and equipment. Any other goods and equipment must be stowed and restrained in the cargo transport unit so as to prevent damage to the dangerous goods.
- 8.1.2.6 Reserved
- 8.1.2.7 Packagings and IBCs that are fitted with a vented closure must be stowed and restrained with the closure uppermost.
- 8.1.2.8 If the dangerous goods are of a kind that may lead to the formation of flammable, toxic or other harmful atmospheres, they must be stowed so that no harmful atmosphere will accumulate in the vehicle cabin in event of leakage.
- 8.1.2.9 During loading and unloading, packages containing dangerous goods must be protected from being damaged. Particular attention must be paid to the handling of packages during their preparation for transport, the type of cargo transport unit on which they are to be carried and to the method of loading or unloading, so that accidental damage is not caused through dragging or mishandling of the packages. Packages that appear to be leaking or damaged so that the contents may escape must not be accepted for transport. If a package is found to be damaged so that the contents leak, the damaged package must not be transported but moved to a safe place. [UN 7.1.1.10]
- 8.1.2.10 If packages containing dangerous goods are stowed on a pallet, the pallet must be of sound construction and free of projections.
- 8.1.2.11 Any thing used to restrain another thing for the purposes of this Chapter ("the device") must be in good condition, and must be free from any defect that might lessen the ability of the device to achieve its function.

### 8.1.3

### OPEN AND NON-RIGID SIDED VEHICLES AND CONTAINERS

#### 8.1.3.1

This Section applies to the transport of dangerous goods on vehicles and freight containers that are not closed cargo transport units (e.g. stowed on an open tray or platform or in a curtain sided cargo transport unit).

**NOTE:** *Vehicles and freight containers with curtain sides are not closed cargo transport units and are therefore subject to this Section.*

#### 8.1.3.2

Except where 8.1.3.4 or 8.1.3.5 applies, if unpackaged dangerous articles or dangerous goods in packages are transported on a vehicle or container described in 8.1.3.1, they must be restrained using one of the following methods:

1. stowed and restrained within rigid sides or load-rated gates, provided the following conditions are met:
  - (a) no dangerous article or package containing dangerous goods may protrude above the sides or gates by more than 30% of the height of the article or package; and
  - (b) no parts of an article or package may protrude horizontally beyond the sides or gates; and
  - (c) the dangerous goods are stowed and restrained to ensure the rated capacity of the gates is not exceeded.
2. In accordance with a Certified Load Restraint System

#### 8.1.3.3

Despite 8.1.3.2, gates to the rear of the dangerous goods on a road vehicle may be omitted if:

- (a) the dangerous goods are loaded towards the front of the vehicle; and
- (b) other goods are stowed and restrained at the rear of the dangerous goods in accordance with the Load Restraint Guide in such a manner that the dangerous goods will be prevented from falling from the vehicle during transport; and
- (c) those other goods remain in place throughout the journey.

#### 8.1.3.4

If dangerous goods of Class 2 that are secured in gas industry cylinder pallets (stillages), are transported on a vehicle or container described in 8.1.3.1:

- (a) the cylinders must be secured within the frame of the stillage, by a lashing system to meet the Load Restraint Guide; and
- (b) not more than 45% of the height of the cylinder may protrude above the stillage rail; and
- (c) the stillages must be stowed and restrained on the vehicle or open freight container in accordance with the Load Restraint Guide.

**NOTE:** *For orientation of cylinders of liquefied gas, see also 7.1.4.3.*

#### 8.1.3.5

Dangerous goods in IBCs, large packagings, segregation devices, pressure drums, MEGCs or bundles of cylinders are not subject to 8.1.3.2 if they are restrained in accordance with the Load Restraint Guide.

## CHAPTER 8.2: RESTRAINT OF CARGO TRANSPORT UNITS ON VEHICLES

### 8.2.1 RESTRAINING FREIGHT CONTAINERS

A freight container containing dangerous goods which is transported on a vehicle must be restrained on the vehicle:

- (a) for road transport, in accordance with the performance standards specified in Load Restraint Guide<sup>1</sup> ; and
- (b) for rail transport, as required under the relevant legislation or agreements concerning Rail Safety.

**NOTE:** *These requirements will normally be met by the use of four engaged twist locks.*

### 8.2.2 RESTRAINING PORTABLE TANKS

8.2.2.1 Portable tanks may only be transported on vehicles whose fastenings are capable, in conditions of maximum permissible loading of the portable tanks, of absorbing the forces specified in 6.7.2.2.12, 6.7.3.2.9 or 6.7.4.2.12, as appropriate.

**NOTE:** *Usage of portable tanks is subject to Chapter 4.2 of this Code. For liquids, particular attention is drawn to 4.2.1.9.6.*

8.2.2.2 A portable tank which is transported on a vehicle must be securely fastened to the vehicle using either:

- (a) four engaged twist locks; or
- (b) another equally effective method for securing the portable tank, in accordance with the Load Restraint Guide.

8.2.2.3 Except when the tank is nominally empty, dangerous goods in the liquid state must not be transported on a road vehicle in a portable tank having a capacity of more than 7,500 litres, unless:

- (a) the height of the centroid of the tank cross section at tank half length falls within an isosceles triangle having:
  - (i) a base length at ground level equal to the overall width between the outside walls of the outside tyres of the main load bearing axle groups, and
  - (ii) base angles not exceeding 64 degrees; or
- (b) the distance between the ground and the load bearing surface of the bottom corner casting of the loaded tank does not exceed 1100mm.

8.2.2.4 If a portable tank is marked with notations indicating how it should be handled in the transport of dangerous goods, it must be handled in accordance with those notations.

---

<sup>1</sup>Load Restraint Guide, 3<sup>rd</sup> Edition 2018, National Transport Commission, ISBN: 978-0-6480157-5-8 or Load Restraint guide for Light Vehicles 2018, National Transport Commission, ISBN: 978-0-6480157-6-5.

### 8.2.3

### RESTRAINING BULK CONTAINERS

#### 8.2.3.1

A bulk container in the form of a freight container must be restrained on the vehicle in accordance with 8.2.1.

#### 8.2.3.2

A BK1 or BK2 bulk container that is not an integral part of the vehicle and is not in the form of a freight container must be restrained on the vehicle in accordance with the Load Restraint Guide.

#### 8.2.3.3

A flexible (BK3) bulk container must be restrained in a cargo transport unit in accordance with section 8.2.4.

#### 8.2.3.4

If a bulk container is marked with notations indicating how it should be handled in the transport of dangerous goods, it must be handled in accordance with the notations.

### 8.2.4

### STOWING AND RESTRAINING FLEXIBLE BULK CONTAINERS

#### 8.2.4.1

Flexible bulk containers must be transported within a conveyance with rigid sides and ends that extend at least two-thirds of the height of the flexible bulk container.

**NOTE:** *When loading flexible bulk containers in a freight container particular attention is to be paid to the IMO/ILO/UNECE Guidelines for Packing Cargo Transport Units (CTUs) contained in the supplement to the International Maritime Dangerous Goods Code.*

#### 8.2.4.2

Flexible bulk containers must be secured by suitable means capable of restraining the container in the conveyance in a manner that will prevent any movement during transport which would change the orientation of the container or cause the container to be damaged. Movement of the containers may also be prevented by filling any voids by the use of dunnage or by blocking and bracing. Where restraints such as banding or straps are used, these must not be over-tightened to cause damage or deformation to the flexible bulk containers.

#### 8.2.4.3

Flexible bulk containers must not be stacked for road or rail transport.

# **PART 9**

# **SEGREGATION**

## CHAPTER 9.1: INCOMPATIBLE GOODS

### 9.1.1

#### INTERPRETATION

**Class, Division and Subsidiary Hazard.** For the purpose of this Part, a reference to a class of dangerous goods (for example, Class 4) is a reference to that class, to every hazard division into which that class is sub-divided (for example, Divisions 4.1, 4.2 and 4.3) and to every subsidiary hazard corresponding to that class or division (for example, Subsidiary Hazards 4.1, 4.2 and 4.3). A reference to a hazard division into which a class is sub-divided (for example Division 4.1) is a reference only to that division, and to the subsidiary hazard (if any) corresponding to that hazard division (for example, Subsidiary Hazards 4.1).

### 9.1.2

#### INCOMPATIBILITY BASED ON CLASSIFICATION

#### 9.1.2.1

Table 9.1 gives an indication of dangerous goods compatibility for land transport purposes, based on Classes, Divisions, Subsidiary Hazards and some specific types of goods.

**NOTE 1:** *Where it is indicated in Table 9.1 that goods of particular classification combinations are incompatible, then all goods of those combinations should be considered incompatible unless there is substantial documented evidence that particular goods are in fact compatible. This evidence could include a statement on the Safety Data Sheet<sup>1</sup> of both substances or articles that they are compatible.*

**NOTE 2:** *Compatibility assessment based on Table 9.1 has no validity under the IMDG Code, ICAO Rules or IATA Regulations for sea and air transport.*

**NOTE 3:** *Depending on other risk factors, compatibility assessment based on Table 9.1 may not be relevant to storage situations, particularly where large volumes of dangerous goods are stored and handled. Reference should be made to the Safety Data Sheets for each substance or article and risks assessed accordingly.*

#### 9.1.2.2

#### Explosives

##### 9.1.2.2.1

Except where otherwise specially provided for in this Code and the Australian Explosives Code, goods of Class 1 are incompatible with dangerous goods of other classes.

##### 9.1.2.2.2

For the purposes of this Code, dangerous goods of Division 1.4, compatibility group S are considered compatible with other dangerous goods provided the aggregate quantity of all dangerous goods in the cargo transport unit is less than a placard load.

**NOTE:** *The Australian Explosives Code does not restrict the transport of Division 1.4S with other dangerous goods.*

---

<sup>1</sup>Safety Data Sheets [SDS] are also known as Material Safety Data Sheets [MSDS].

### 9.1.2.3

### Food and food packagings

Despite an entry in Table 9.1 that food and food packagings are incompatible with dangerous goods of Class 8, food ingredients that are Class 8 dangerous goods are not considered to be incompatible with other food ingredients if the intended use of those ingredients is for the manufacture of food, or food ingredients, containing those ingredients (or like ingredients), with or without other ingredients.

**Table 9.1: Incompatibility based on Classification**

Goods are considered incompatible if, in this table, any of the following conditions are met:

- the primary hazard of one is incompatible with the primary hazard of the other; or
- the primary hazard of one is incompatible with a subsidiary hazard of the other; or
- a subsidiary hazard of one is incompatible with a subsidiary hazard of the other.

|                   |                                                                       |     |       |       |       |       |     |     |     |       |       |       |       |       |       | Food or Food empties | Fire-risk substances or Com-bustible liquids |
|-------------------|-----------------------------------------------------------------------|-----|-------|-------|-------|-------|-----|-----|-----|-------|-------|-------|-------|-------|-------|----------------------|----------------------------------------------|
| CLASS or DIVISION |                                                                       | 1   | 2.1   | 2.2   | 2.3   | 3     | 4.1 | 4.2 | 4.3 | 5.1   | 5.2   | 6     | 7 (7) | 8     | 9     |                      |                                              |
| 1                 | Explosives                                                            | (1) | (1)   | (1)   | (1)   | (1)   | (1) | (1) | (1) | (1)   | (1)   | (1)   | (1)   | (1)   | (1)   | (1)                  | (1)                                          |
| 2.1               | Flammable gas                                                         | (1) | 0     | 0 (3) | 0     | 0 (2) | N   | N   | N   | N     | N     | 0     | N     | 0     | 0     | 0                    | 0                                            |
| 2.2               | Non-flam-mable non-toxic gas                                          | (1) | 0 (3) | 0     | 0 (4) | 0     | 0   | N   | 0   | 0     | N     | 0     | 0     | 0     | 0     | 0                    | 0                                            |

| 3                 | Flammable liquids                                                     | (1) | 0 (2) | 0     | N     | 0     | 0   | N   | 0   | N     | N     | 0 (6) | N     | 0     | 0     | 0                    | 0                                            |
| 4.1               | Flammable solids                                                      | (1) | N     | 0     | 0     | 0     | 0   | N   | 0   | N     | N     | 0     | N     | 0     | 0     | 0                    | 0                                            |
| 4.2               | Spon-taneously combustible                                            | (1) | N     | N     | N     | N     | N   | 0   | 0   | N     | N     | 0     | N     | 0     | 0     | 0                    | 0                                            |
| 4.3               | Dangerous when wet                                                    | (1) | N     | 0     | 0     | 0     | 0   | 0   | 0   | N     | N     | 0     | N     | N     | 0     | 0                    | 0                                            |
| 5.1               | Oxidising substances                                                  | (1) | N     | 0     | N     | N     | N   | N   | N   | 0 (6) | N     | 0 (5) | N     | N     | 0 (5) | 0                    | N                                            |
| 5.2               | Organic peroxides                                                     | (1) | N     | N     | N     | N     | N   | N   | N   | N     | 0     | 0 (5) | N     | N     | 0 (5) | 0                    | N                                            |
| 6                 | Toxic or Infec-tious sub-stances                                      | (1) | 0     | 0     | 0     | 0 (6) | 0   | 0   | 0   | 0 (5) | 0 (5) | 0     | 0     | 0 (6) | 0     | N(8)                 | 0                                            |
| 7                 | Radioactive material (7)                                              | (1) | N     | 0     | 0     | N     | N   | N   | N   | N     | N     | 0     | 0     | N     | 0     | N(8)                 | 0                                            |
| 8                 | Corrosive substances                                                  | (1) | 0     | 0     | 0     | 0     | 0   | 0   | N   | N     | N     | 0 (6) | N     | 0 (6) | 0     | N(8)                 | 0                                            |
| 9                 | Miscellaneous dangerous goods / envi-ronmentally hazardous substances | (1) | 0     | 0     | 0     | 0     | 0   | 0   | 0   | 0 (5) | 0 (5) | 0     | 0     | 0     | 0     | 0                    | 0                                            |

**In this table:**

0 means compatible unless a numbered exception applies.

N means incompatible unless a numbered exception applies.

**Exceptions (see Table 9.1):**

- (1) Explosives are incompatible in transport with all other dangerous goods in all quantities except as provided in the Australian Explosives Code or, for Division 1.4S, where 9.1.2.2.2 applies.
- (2) Division 2.1 and Class 3 are incompatible in transport if both are in tanks or other receptacles with a capacity individually exceeding 500 L.
- (3) Division 2.1 is incompatible in transport with gases of Division 2.2 that have a subsidiary hazard 5.1 except when all are packed in cylinders or pressure drums not exceeding 500 L capacity.
- (4) Division 2.3 is incompatible in transport with gases of Division 2.2 that have a subsidiary hazard 5.1 except when all are packed in cylinders or pressure drums not exceeding 500 L capacity.
- (5) Class 5 is incompatible with those Class 6 or Class 9 materials that are fire-risk substances.
- (6) Some specific examples of these Classes or Divisions are incompatible —see Table 9.2.
- (7) See the Code of Practice for the Safe Transport of Radioactive Substances regarding the compatibility of Class 7 with undeveloped photographic film, personnel and mail.
- (8) Food and food packagings are incompatible with these classes in all quantities, except where 9.1.2.3 applies.

9.1.3

SPECIFIC EXAMPLES OF INCOMPATIBLE GOODS

Table 9.2 lists some examples of particular dangerous goods which are incompatible. The dangerous goods specified in an item in column 1 of Table 9.2 are incompatible with the dangerous goods specified in that item in column 2 of the Table.

**Table 9.2: Examples of Particular Incompatible Dangerous Goods not identified in Table 9.1**

| Column 1<br>Dangerous Goods or<br>Group of Dangerous Goods    | Column 2<br>Goods Incompatible with<br>Column 1 Group                                                                                                                            |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ammonium nitrate                                              | Tetranitromethane<br>Dichloroisocyanuric acid<br>Trichloroisocyanuric acid<br>any:<br>bromate<br>chlorate<br>chlorite<br>hypochlorite<br>chloroisocyanurate<br>inorganic nitrite |
| Calcium hypochlorite<br>(Dry or Hydrated)<br>and its mixtures | Ammonium nitrate<br>Dichloroisocyanuric acid<br>Trichloroisocyanuric acid<br>any chloroisocyanurate                                                                              |

|                           |                             |
|---------------------------|-----------------------------|
| Class 6                   | Nitromethane                |
| Concentrated strong acids | Concentrated strong alkalis |
| Cyanide compounds         | Acids                       |

**NOTE:** Although both acids and bases (alkalis) are both Class 8 dangerous goods they can be incompatible as a transport load. In particular, what is described as strong acids and strong bases have long been considered incompatible due to the potential for violent reaction. The exact strength of the acid or base that will result in a violent reaction (explosion or fire) or evolve gases (flammable or toxic) depends heavily on the actual acids or bases being transported. Incompatibilities should be determined from the SDS in the first instance. Advice can also be obtained from a suitable industrial chemist, dangerous goods transport professional or State or Territory regulatory authority.

## CHAPTER 9.2: SEGREGATION

### 9.2.1 APPLICATION AND PRINCIPLES

**NOTE:** Goods segregated in accordance with this Chapter will not necessarily comply with the IMDG Code, ICAO Rules or IATA Regulations for sea and air transport.

9.2.1.1 The segregation requirements of this chapter apply only to placard loads of dangerous goods, except:

- (a) where, in the explanatory text at the foot of Table 9.1, it is indicated that particular goods are incompatible in all quantities; and
- (b) 9.2.1.4 which applies to all quantities of dangerous goods; and
- (c) dangerous goods carried on passenger trains when 9.2.4.7 applies.

9.2.1.2 This chapter does not apply to dangerous goods transported on trains or rail wagons that are being shunted at not more than 15 kilometres per hour.

9.2.1.3 Dangerous goods must not be transported on the same road vehicle or train with incompatible goods unless the dangerous goods and the incompatible goods:

- (a) are segregated in accordance with this chapter; or
- (b) are otherwise allowed under this Code to be transported together.

9.2.1.4 An overpack, a large packaging or a segregation device must not contain dangerous goods which are incompatible with one another, except where all the dangerous goods are packed as limited quantities in accordance with Chapter 3.4, in which case 3.4.6 applies.

9.2.1.5 A cargo transport unit must not contain dangerous goods which are incompatible with each other unless segregated in accordance with Section 9.2.2.

9.2.1.6 When interpreting the requirements of this chapter, the following principles from UN23 must be applied:

- (a) Incompatible dangerous goods must be segregated from one another so as to effectively minimise risk in the event of accidental leakage or spillage or any other accident.
- (b) Whenever dangerous goods are stowed together, the most stringent segregation provisions for any of the goods must be applied.
- (c) For packages required to bear a subsidiary hazard label, the segregation appropriate to the subsidiary hazard must be applied when it is more stringent than that required by the primary hazard.

### 9.2.2 SEGREGATION METHODS

#### 9.2.2.1 Separate road vehicles

Except where otherwise specified in Section 9.2.3, dangerous goods are segregated from incompatible goods in accordance with this Code if the dangerous goods are carried on one vehicle and the incompatible goods

are carried on another vehicle forming part of the same combination road vehicle.

#### **9.2.2.2 Separate rail wagons or load platforms**

Except where otherwise specified in Section 9.2.3 or 9.2.4, dangerous goods are segregated on a train from incompatible goods in accordance with this Code if the dangerous goods and the incompatible goods are carried on separate rail wagons or load platforms.

#### **9.2.2.3 Separate freight containers**

Except where otherwise specified in Section 9.2.3 or 9.2.4, dangerous goods are segregated from incompatible goods in accordance with this Code if:

- (a) either the dangerous goods or the incompatible goods are contained in a closed freight container with rigid sides and ends; or
- (b) when transported by rail in other demountable cargo transport units such as open or curtain-sided freight containers on the same load platform of a rail wagon, there is a distance (which may be occupied by other loading) of at least 6 m, measured horizontally, between the unit loaded with the dangerous goods and the unit loaded with the incompatible goods.

#### **9.2.2.4 Packagings for segregation**

9.2.2.4.1 Dangerous goods are segregated from incompatible goods if the dangerous goods are packed in a Packaging for Segregation that:

- (a) has been approved for that purpose by a Competent Authority; and
- (b) has three levels of containment, comprising:
  - (i) an inner packaging; and
  - (ii) a leakproof intermediate packaging; and
  - (iii) an outer packaging; and
- (c) has been tested in accordance with Section 6.1.5 of this Code to the standard required for dangerous goods of packing group I; and
- (d) is marked with the words “Approved Packaging for Segregation”; and
- (e) if the dangerous goods are of packing group I, also complies with 9.2.2.4.2.

9.2.2.4.2 When a packaging for segregation is used for dangerous goods of packing group I:

- (a) the intermediate packaging required by 9.2.2.4.1(b)(ii) must be of metal or rigid plastics construction; and
- (b) if inert absorbent material is required, that material must be contained inside the intermediate packaging; and
- (c) the marking required by 9.2.2.4.1(d) must be supplemented with the expression “PGI”, so that it reads “Approved Packaging for Segregation, PGI”.

### 9.2.2.5

### Large packagings

Dangerous goods are segregated from incompatible goods if the dangerous goods are packed in a large packaging in accordance with a Packing Instruction in Chapter 4.1 that is:

- (a) authorised for those goods by an entry in Column 8 of the Dangerous Goods List in Chapter 3.2; and
- (b) prefixed 'LP' (e.g. 'LP01' for many liquid dangerous goods of packing group III).

The large packaging must not contain goods that are incompatible with each other.

**NOTE:** 9.2.2.5 provides segregation only for the dangerous goods that are in the large packaging. If the incompatible goods are also dangerous goods, these must also be in a large packaging (where authorised), a packaging for segregation, a segregation device, or be otherwise segregated from the first dangerous goods in accordance with this Chapter.

### 9.2.2.6

### Segregation devices

Dangerous goods of packing group II or III are segregated from incompatible goods in accordance with this Code if either the dangerous goods or the incompatible goods are packed in accordance with Section 4.4.5, in a segregation device which meets the requirements of Chapter 6.11.

### 9.2.3

### SPECIAL SEGREGATION PROVISIONS

Despite 9.2.2.1, 9.2.2.2 and 9.2.2.3, some goods which react dangerously must not be transported on the same road vehicle or combination road vehicle or, when transported by rail, must be separated by intervening wagons or load platforms, in accordance with Table 9.3.

**Table 9.3: Restricted Loads on Certain Vehicles**

| Row No. | Goods A                                                                      | Receptacle Size | Goods B                                                                    | Receptacle Size | Restriction |          |
|---------|------------------------------------------------------------------------------|-----------------|----------------------------------------------------------------------------|-----------------|-------------|----------|
|         |                                                                              |                 |                                                                            |                 | Road        | Rail     |
| 1.      | Any dangerous goods of Class 5 or Subsidiary Hazard 5.1                      | > 500 kg(L)     | Any dangerous goods of Class or Subsidiary Hazard 3, or Combustible Liquid | > 500 L         | <b>a</b>    | <b>b</b> |
| 2.      | Any dangerous goods of Division or Subsidiary Hazard 2.1                     | > 500 L         | Any dangerous goods of Class or Subsidiary Hazard 3, 4 or 5                | > 500 kg(L)     | <b>a</b>    | <b>b</b> |
| 3.      | Ammonium Nitrate of any Division in any form (including UN 0222, 1942, 2067, | > 500 L         | Any sensitising or initiating agent #                                      | Any             | <b>a</b>    | <b>b</b> |

| Row No. | Goods A                                         | Receptacle Size | Goods B                                                   | Receptacle Size | Restriction |      |
|---------|-------------------------------------------------|-----------------|-----------------------------------------------------------|-----------------|-------------|------|
|         |                                                 |                 |                                                           |                 | Road        | Rail |
|         | 2071, 2426 or 3375)                             |                 |                                                           |                 |             |      |
| 4.      | UN 3414 Sodium Cyanide Solution of Division 6.1 | > 500 L         | UN 2014, 2015 or 2984 Hydrogen Peroxide of Division 5.1 # | Any             | a           | b    |
| 5.      | Any Cyanide of Division 6.1                     | Any             | Any Acid of Class 8 #                                     | Any             | c           | d    |
| 6.      | Any Cyanide of Division 6.1                     | > 500 kg(L)     | Any Acid of Class 8                                       | > 500 L         | c           | e    |
| 7.      | Any placard load of Explosives                  | Any             | Any other placard load                                    | Any             | f           | g    |

**Table notes:**

- a. (Road) Dangerous goods mentioned in the column headed Goods A must not be transported on any road vehicle at the same time as goods described as Goods B in the same numbered row of this table, even if the Goods A and Goods B are in different freight containers, bulk containers, portable tanks or different vehicles making up a combination vehicle.
- b. (Rail) A freight container or wagon transporting a placard load that includes dangerous goods described as Goods A must be separated on a train from a freight container or wagon transporting a placard load that includes Goods B in the same row of this table by at least one intervening load platform that may, subject to the other segregation provisions of this Chapter, be loaded with other dangerous goods.
- c. (Road) A placard load on a road vehicle, including a combination vehicle, must not include at the same time, Cyanides of Division 6.1 and Acids of Class 8, in any quantity, even if they are in separate cargo transport units or on different vehicles making up a combination vehicle, unless Packagings for Segregation are used in accordance with 9.2.2.4.
- d. (Rail) Except where e. applies, a freight container or wagon transporting a placard load that includes Cyanides of Division 6.1 must be separated on a train by at least two intervening load platforms from a freight container, portable tank or wagon transporting a placard load that includes Acids of Class 8.
- e. (Rail) A freight container or wagon transporting Cyanide of Division 6.1 in a receptacle > 500 kg(L) must be separated on a train from a freight container or wagon transporting any Acid of Class 8 in a receptacle > 500 L by at least 15 intervening load platforms that may, subject to the other segregation provisions of this Chapter, be loaded with other dangerous goods. However, if all of the receptacles in or on a freight container or wagon transporting such Cyanide, or such Acid, or both, are nominally empty, it is only necessary that the container or wagon be separated by at least 2 such intervening load platforms.
- f. (Road) See Australian Explosives Code.
- g. (Rail) A rail wagon transporting a Category 2 or 3 explosives load (see Australian Explosives Code) must be separated on a train by at least two intervening load platforms from a freight container or wagon transporting a placard load of other dangerous goods. See Australian Explosives Code for separation between placard loads of explosives.

# Except where this substance is transported in a Packaging for Segregation in accordance with 9.2.2.4.

**NOTE:** A reference in this table to Goods A or Goods B: means those goods only while they are in receptacles of the sizes indicated, but does not include residues of those goods in those receptacles when they are nominally empty and this is clearly evident from the transport documentation in accordance with 11.1.3.1.

## **9.2.4**

### **ADDITIONAL RAIL PROVISIONS**

#### **9.2.4.1**

Except for transport in a rail tank wagon or where 9.2.4.7 applies, dangerous goods must not be transported in the nearest cargo transport unit to either end of the train.

#### **9.2.4.2**

Except as provided in 9.2.4.7, a placard load of dangerous goods must not be transported in the nearest cargo transport unit to rolling stock carrying people (including a locomotive or van carrying train crew).

#### **9.2.4.3**

A rail tank wagon transporting dangerous goods of Division 2.1 must not:

- (a) despite 9.2.4.1, be the first or last wagon of a train; or
- (b) be marshalled immediately coupled to another such tank wagon unless exempted by the Competent Authority.

#### **9.2.4.4**

### **Reserved**

#### **9.2.4.5**

Dangerous goods must be separated by at least two intervening load platforms from other containers or wagons on the train which are transporting loads which could pose a significant piercing hazard, such as logs, rails, beams and pipes which are not effectively protected by bulkheads.

#### **9.2.4.6**

Dangerous goods must not be transported by rail in a bi-modal (road/rail) tank wagon unless approved by the Competent Authority and agreed by the rail track owner.

#### **9.2.4.7**

### **Passenger trains**

#### **9.2.4.7.1**

Dangerous goods must not be taken on board a passenger train or transported in a passenger compartment or in an area designated on a passenger train for the carriage of passenger luggage, except:

- (a) medical gases that may be required for use by a passenger during the journey; and
- (b) other dangerous goods that are:
  - (i) in quantities not exceeding those specified as limited quantities for the particular substance or article in Column (7) of the Dangerous Goods List in Chapter 3.2; and
  - (ii) the personal property of a passenger on the train.

#### **9.2.4.7.2**

A rail wagon that is attached to the rear of a passenger train may transport not more than 5 tonnes of dangerous goods, other than:

- (a) Class 1 or 7; or
- (b) Division 2.1 or 2.3; or
- (c) Packing group I of any Class or Division.

- 9.2.4.7.3 The dangerous goods transported in the rail wagon described in 9.2.4.7.2 must be:
- (a) segregated in accordance with Section 9.2.2; and
  - (b) described on transport documentation in accordance with Chapter 11.1.

- 9.2.4.7.4 The rail wagon described in 9.2.4.7.2 must be placarded when the dangerous goods in the wagon is a placard load.

## **9.2.4.8 Double stacking of freight containers**

- 9.2.4.8.1 Where double stacking of freight containers is permitted by the rail track owner, the following may be loaded in a vertical stack:

- (a) freight containers of dangerous goods of the same UN Number; or
- (b) dangerous goods of Class 3, 6 and 9 (mixed or in separate containers); or
- (c) a freight container of dangerous goods and a freight container of non-dangerous goods; or
- (d) freight containers that contain less than a placard load of dangerous goods.

- 9.2.4.8.2 The following loads of dangerous goods in freight containers may not be transported in a vertical stack:

- (a) liquid or gaseous dangerous goods in portable tanks or multiple element gas containers; or
- (b) dangerous goods of Class 1; or
- (c) freight containers known to contain food or food packaging with freight or bulk containers or portable tanks placarded with label model Nos. 2.3, 6.1, 6.2, 7(A–E), 8 or 10 (mixed class); or
- (d) dangerous goods in open or curtain-sided containers; or
- (e) all other combinations not permitted under subclause 9.2.4.8.1.

**NOTE 1:** *The segregation requirements of this chapter still apply.*

**NOTE 2:** *Placards, including labels and Emergency Information Panels when required must be visible from both sides of the rail wagon. In well wagons this may require relocating or additional placarding (see 5.3.7.2.4).*

# **PART 10**

## **BULK TRANSFER OF DANGEROUS GOODS**

## CHAPTER 10.1: TRANSFER EQUIPMENT

### 10.1.1 APPLICATION AND DEFINITIONS

#### 10.1.1.1 Application

This Part applies to the transfer by gravity, pump or pressure differential of liquid, solid or gaseous dangerous goods into or out of a tank vehicle, or into or out of a portable tank, demountable tank, bulk container, pressure drum, tube, MEGC or IBC that is on a vehicle, utilising pipework and/or hose assembly.

#### 10.1.1.2 Definitions

For the purposes of this Part:

**Maximum delivery pressure** means the maximum pressure that can occur in a system regardless of whether or not it is under pump pressure or at zero flow, including the effects of dead heading and system back pressure;

**Maximum design pressure** means the maximum pressure for which hose assembly has been designed and tested;

**Transfer out of a vehicle** includes transfer out of the tank of a tank vehicle or from a portable tank, demountable tank, bulk container, pressure drum, tube, MEGC or IBC that is on a vehicle;

**Transfer into a vehicle** includes transfer into the tank of a tank vehicle or into a portable tank, demountable tank, bulk container, pressure drum, tube, MEGC or IBC that is on a vehicle.

### 10.1.2 TRANSFER EQUIPMENT AND HOSE ASSEMBLIES

#### 10.1.2.1 General

Transfer equipment and hose assemblies used for transfer of dangerous goods must be fit for purpose.

#### 10.1.2.2 Hose assemblies for Class 2 (other than LP Gas or anhydrous ammonia)

A hose assembly used to transfer dangerous goods of Class 2, other than LP Gas or anhydrous ammonia (UN 1005), must have a maximum design pressure of not less than 1.5 times the maximum delivery pressure of the transfer system in which the hose is used.

#### 10.1.2.3 Hose assemblies for LP Gas

A hose assembly used to transfer LP Gas must:

- (a) comply with AS/NZS 1869 or UL 21;
- (b) be tested in accordance with AS/NZS 1869; and
- (c) be retested in accordance with AS/NZS 1596.

#### **10.1.2.4 Hose assemblies for anhydrous ammonia (UN 1005)**

A hose assembly used to transfer anhydrous ammonia (UN 1005) must:

- (a) comply with AS/NZS 2022; and
- (b) be tested in accordance with AS/NZS 2022.

#### **10.1.2.5 Hose assemblies for Class 3 petroleum products**

10.1.2.5.1 A hose assembly used to transfer dangerous goods of Class 3 petroleum products must:

- (a) comply with AS 2683; and
- (b) be tested in accordance with AS 2683.

10.1.2.5.2 Reserved

#### **10.1.2.6 Hose assemblies for liquid dangerous goods other than Class 2 or Class 3 petroleum products**

A hose assembly used to transfer dangerous goods in liquid form other than Class 2 or Class 3 petroleum products must:

- (a) comply with AS 2594;
- (b) be tested in accordance with AS 2594; and
- (c) have a rated maximum design pressure of not less than 1.5 times the maximum delivery pressure of the transfer system in which the hose is used.

### **10.1.3 HOSE TESTING**

#### **10.1.3.1 Periodic inspection**

A hose assembly must be inspected for damage over its entire length at intervals of not more than one month.

#### **10.1.3.2 Electrical continuity testing**

10.1.3.2.1 This clause applies to a hose assembly used to transfer:

- (a) dangerous goods of Class 3 or 4; or
- (b) dangerous goods (other than Class 2) with a Subsidiary Hazard of 3 or 4.

10.1.3.2.2 The hose assembly must be tested in accordance with AS 1180.13B for electrical continuity before it is first used to transfer dangerous goods. The resistance of the hose assembly must comply with the resistance values specified for electrical properties in AS 2683 for the kind of hose assembly being tested.

- 10.1.3.2.3 The hose assembly must be retested in accordance with AS 1180.13B, and, where applicable to the kind of hose assembly being tested, for electrical continuity in accordance with AS 1180.13C at intervals of no more than 6 months. The resistance of the hose assembly must comply with the resistance values specified for electrical properties in AS 2683 for the kind of hose assembly being tested.
- 10.1.3.2.4 If a hose assembly consists of two or more Kind 1 hose assemblies<sup>1</sup>, coupled together, it must be constructed, assembled and maintained, so that the resistance between the end couplings does not exceed 10  $\Omega$ .
- 10.1.3.2.5 If a hose assembly consists of two or more hose assemblies which are not of Kind 1, it must be constructed, assembled and maintained so that the resistance between the couplings does not exceed the resistance values for electrical properties in AS 2683 for the relevant kind of hose assembly.

### **10.1.3.3 Hydrostatic pressure testing**

Unless otherwise specified in this Code or a relevant Standard, a hose assembly used to transfer dangerous goods must be hydrostatically tested at the pressure required by this Code, which must be not less than the rated maximum working pressure:

- (a) not more than 12 months before its initial use; and
- (b) thereafter at the intervals required by the relevant standard, or, otherwise, on or before each anniversary of its first use.

### **10.1.3.4 Keeping records**

- 10.1.3.4.1 Each hose assembly must be marked with a distinctive identifying number.
- 10.1.3.4.2 An accurate record must be kept for the life of each hose assembly of:
- (a) the date on which each test required to be carried out by this chapter is carried out;
  - (b) the nature of the test carried out;
  - (c) the date on which maintenance work is carried out on the hose assembly; and
  - (d) the nature of the maintenance work.

---

<sup>1</sup>Kind 1 hose as described in AS 2683

## CHAPTER 10.2: TRANSFER REQUIREMENTS

### 10.2.1 WHERE TO TRANSFER DANGEROUS GOODS

#### 10.2.1.1 Position of vehicle during transfer of Division 2.1 or Class 3

10.2.1.1.1 Dangerous goods of Division 2.1, Class 3, or with a Subsidiary Hazard 2.1 or 3, must not be transferred into or out of a road vehicle unless the vehicle is positioned:

- (a) so that it can be driven away in a forward direction; or
- (b) if it is not reasonably practicable to drive the vehicle in a forward direction owing to the layout of the site so that it can be driven away with minimal manoeuvring.

10.2.1.1.2 The area through which the vehicle needs to move or manoeuvre in order to leave the premises on which the transfer takes place must, as far as practicable, be kept clear while the vehicle is on the premises.

#### 10.2.1.2 Transfer in a public area

10.2.1.2.1 This sub-section applies at any place that is:

- (a) in a built up area with public access; or
- (b) within 15 metres of any building or any other place where there is likely to be a concentration of people, other than a building on the premises where the transfer takes place.

10.2.1.2.2 Dangerous goods of packing group I or Division 2.3 [other than ammonia, anhydrous (UN 1005) or ammonia solution (UN 3318)] must not be transferred out of a road vehicle in a place described in 10.2.1.2.1.

10.2.1.2.3 Dangerous goods must not be transferred out of one vehicle into another vehicle in a place described in 10.2.1.2.1.

#### 10.2.1.3 Transfer operation within a designated transfer area

If dangerous goods are to be transferred into or out of a vehicle, and the occupier of premises has marked or otherwise designated an area on the premises in which a transfer operation is to take place, the vehicle must be parked within the designated area during the transfer operation.

#### 10.2.1.4 Transfer in enclosed space

Dangerous goods must not be transferred into or out of a vehicle that is in an enclosed space if the transfer is likely to give rise to dangerous concentrations of dusts, mists or vapours.

#### 10.2.1.5 Positioning of hose assembly during transfer

If dangerous goods are to be transferred into or out of a vehicle in an area which is accessible to other vehicles, all reasonably practicable

measures must be taken to prevent any vehicle from driving over the hose assembly or striking its connections.

## **10.2.2 PREVENTING FIRE DURING A TRANSFER OPERATION**

### **10.2.2.1 Distance from ignition sources**

During a transfer operation into or out of a vehicle, there must be no source of ignition: within any hazardous area determined in accordance with AS/NZS 60079.10.1<sup>1</sup>.

### **10.2.2.2 Engine precautions**

10.2.2.2.1 During transfer of dangerous goods of Class, Division or Subsidiary Hazard 2.1, 3 or 4 out of a road vehicle, the engine of the vehicle must remain stopped unless the transfer involves the use of a pump or compressor driven by the vehicle's engine. This does not prevent the minimal necessary use of the engine to clear the contents of hoses back into the tank following the transfer.

10.2.2.2.1A During transfer of dangerous goods of Class, Division or Subsidiary Hazard 2.1, 3 or 4 into a road vehicle, the engine of the vehicle must remain stopped unless the vehicle is a vacuum tank vehicle.

10.2.2.2.2 The engine of the vehicle, and any internal combustion auxiliary engine on the vehicle, must be stopped while hose connections for the transfer of dangerous goods of Division or Subsidiary Hazard 2.1 are coupled to or uncoupled from the vehicle or tank on the vehicle.

### **10.2.2.3 Electrical bonding**

10.2.2.3.1 Before LP Gas is transferred into or out of a vehicle, the supplying receptacle must be electrically bonded to the receiving receptacle in accordance with AS/NZS 1596.

---

<sup>1</sup>AS/NZS 60079.10.1 is an internationally based Standard that has now replaced the AS/NZS 2430 series of Standards. These Standards are recognised nationally as defining hazardous areas. They prescribe distances both in text and pictorially. These distances vary with the type of dangerous goods and, in the case of tanker loading, are different for installations with or without vapour recovery.

- 10.2.2.3.2 Where dangerous goods of Division 2.1 (other than LP Gas) are transferred into or out of a vehicle and the receiving receptacle is not an underground tank, the supplying receptacle must be electrically bonded to the receiving receptacle before the transfer commences. The bonding must remain in place until all hose assemblies have been uncoupled and all closures have been closed.
- 10.2.2.3.3 Before dangerous goods of Class 3 are transferred into or out of a vehicle, the supplying receptacle must be electrically bonded to the receiving receptacle in accordance with AS 1940.
- 10.2.2.4 Loading spear for Class 3**
- If a tank is filled from the top with dangerous goods of Class or Subsidiary Hazard 3, and is not filled through a tight fill connection and fill pipe in accordance with AS 1692, the loading spear must be in contact with the bottom of the tank while the goods are being transferred.
- 10.2.2.5 Heater restrictions**
- Except where permitted by 13.1.3.5, if a road tank vehicle is equipped with a burner or other means to heat the cargo, the heater must not be operated during a transfer operation.
- 10.2.3 TRANSFER OF DANGEROUS GOODS - GENERAL REQUIREMENTS**
- 10.2.3.1 Dangerous goods must not be transferred into or out of a vehicle, unless the vehicle is secured against movement.
- 10.2.3.2 If dangerous goods are transferred into or out of a vehicle, a person must:
- (a) remain in proximity with the vehicle during the transfer operation; and
  - (b) be in a position to observe all relevant valves, fittings, gauges and hose connections that are used or may be used during the transfer operation; and
  - (c) have access to all equipment necessary to stop the transfer operation in the event of an escape, leak or spill.
- 10.2.3.3 Dangerous goods must not be transferred into or out of a road vehicle, while the cabin of the vehicle is occupied.
- 10.2.3.4 The level of light at all valves, fittings, gauges and hose connections that are used or may be used during a transfer operation must be adequate to allow the transfer operation to be conducted safely.
- 10.2.3.5 If dangerous goods are transferred under gas pressure into or out of a vehicle:
- (a) the design pressure of the supplying receptacle must not be exceeded; and
  - (b) the gas used in the transfer operation must be chemically inert to the dangerous goods being transferred; and
  - (c) air must not be used to transfer dangerous goods of Class 3 or 4 or with a Subsidiary Hazard of 3 or 4.

- 10.2.3.6 A hose used in connection with a transfer operation should be handled so as to avoid excessive curvature, stress, abrasion or kinking that may damage the hose or its connections.
- 10.2.3.7 Despite 10.2.3.1 and 10.2.3.3, if a bitumen tank vehicle is coupled with road making plant, bitumen may be transferred between the vehicles by a connecting hose while the vehicles are in motion and while the cabins are occupied. However the tank vehicle drive away protection system required by AS2809 may only be overridden by the road making plant coupled to the bitumen tank vehicle to allow the coupled units to be moved.
- 10.2.4 TRANSFER OF GAS**
- 10.2.4.1 LP Gas must be transferred into or out of a vehicle in accordance with AS/NZS 1596.
- 10.2.4.2 Liquefied gas must not be transferred into a storage tank or other receptacle housed within a building unless:
- (a) the building is designed and used solely for the purpose of storing dangerous goods of Class 2; or
  - (b) the building may be used for that purpose under a law of the State or Territory in which the building is located that relates to the storage and handling of dangerous goods.
- 10.2.4.3 Subject to 10.2.4.1, when dangerous goods of Division 2.1 or Division 2.3 are transferred out of a vehicle into a storage receptacle and if:
- (a) the line of sight between the vehicle, portable tank or MEGC and the filling point of the storage container is obstructed so that one cannot be seen from the other; or
  - (b) the transfer is at a place described in 10.2.1.2.1:
- a person capable of using the transfer equipment must remain at the vehicle and another person capable of using the transfer equipment must remain at the storage container.
- 10.2.4.4 A person must not transfer liquefied oxygen into or out of a road vehicle unless, during the transfer operation, all surfaces within a distance of 1 metre of the transfer hose are made of concrete or other non-combustible material.
- 10.2.5 TRANSFER OF DANGEROUS GOODS OF CLASS 3**
- 10.2.5.1 Dangerous goods of Class or Subsidiary Hazard 3 must be transferred out of a vehicle into a storage receptacle, in accordance with AS 1940. Direct transfer of these goods out of the vehicle into drums or smaller packagings is not permitted except at facilities designed or designated for the purpose, taking into account the requirements of AS 1940 and AS/NZS 60079.10.
- 10.2.5.2 If a pump is fitted to or carried on the vehicle to or from which dangerous goods of Class or Subsidiary Hazard of 3 are transferred:
- (a) the propulsion engine of the vehicle must not be used to power the pump unless:

- (i) the engine is a compression-ignition engine; and
- (ii) the pump and all associated pipework are shielded from the engine of the vehicle by the provision of a fire shield or by equally effective means; and
- (iii) the pump driving engine requirements of AS 2809.2 are complied with; and
- (b) a spark ignition engine must not be used to power an auxiliary or portable pumping unit; and
- (c) an auxiliary or portable pumping unit powered by a compression-ignition engine must not be used unless the unit is approved by a Competent Authority for that purpose and is operated in accordance with the approval; and
- (d) an electric motor must not be used to power the pump unless the motor and all associated electrical fittings and equipment are suitable for use in a Zone 1 hazardous area as defined in AS/NZS 60079.10.

10.2.5.3 All valves and closures that were removed or opened to enable the transfer to take place must be reinstated or closed after the transfer is completed.

#### **10.2.5.4 Manner of filling**

10.2.5.4.1 Except where 10.2.5.4.2 applies, when dangerous goods of Class or Subsidiary Hazard 3 are transferred into or out of a vehicle, the receptacle on the vehicle and the receiving tank or storage receptacle must be connected by pipeline and hose connection.

10.2.5.4.2 A hand-held nozzle may be used for the transfer of dangerous goods of Class or Subsidiary Hazard 3 into or out of a vehicle if:

- (a) the transfer:
  - (i) takes place on premises which are a farm or mine site; or
  - (ii) is into or out of a tank described in AS 1940 as a minor storage tank; and
- (b) the receiving tank or storage container is fitted with a fill pipe at the tank or container opening.

## CHAPTER 10.3: ULLAGE AND MAXIMUM PERMITTED FILLING RATIO

**NOTE:** This chapter applies only to the filling of tank vehicles.

Portable tanks and MEGCs must be filled only in accordance with the provisions for use in chapter 4.2, as referenced:

(a) for portable tanks, –from the portable tank instructions and special provisions for the particular dangerous goods in Columns (10) and (11) of the Dangerous Goods List in chapter 3.2; or for

(b) MEGCs, –from packing instruction P200 in chapter 4.1.

Bulk containers must be filled in accordance with the provisions for use in chapter 4.3., as referenced from Column (10) of the Dangerous Goods List.

IBCs must be filled in accordance with the provisions of 4.1.1, 4.1.2 and the relevant IBC packing instructions and special packing provisions in 4.1.4.2, as referenced from Columns (8) and (9) of the Dangerous Goods List.

### 10.3.1 ULLAGE

#### 10.3.1.1 Liquid dangerous goods (other than Class 2)

Unless elsewhere specified in this Code or a relevant code or standard referenced in this Code, the ullage in a tank vehicle containing liquid dangerous goods (other than dangerous goods of Class 2) must not be less than:

- (a) 2%- for dangerous goods having a coefficient of expansion of not more than  $90 \times 10^{-5}$  per degree Celsius;
- (b) 3%- for dangerous goods having a coefficient of expansion of more than  $90 \times 10^{-5}$  but not more than  $135 \times 10^{-5}$  per degree Celsius;
- (c) 4%- for dangerous goods having a coefficient of expansion of more than  $135 \times 10^{-5}$  but not more than  $180 \times 10^{-5}$  per degree Celsius; or
- (d) 5%- for dangerous goods having a coefficient of expansion of more than  $180 \times 10^{-5}$  per degree Celsius.

#### 10.3.1.2 Ullage of large tank or compartment

10.3.1.2.1 This clause applies to liquids having a viscosity less than  $2,680 \text{ mm}^2/\text{s}$  at  $20^\circ\text{C}$ , or the maximum temperature of the substance during transport in the case of the heated substance, that are either:

- (a) dangerous goods; or
- (b) liquids other than dangerous goods that are transported in the same tank, or in another tank on the same vehicle or combination vehicle, as dangerous goods.

10.3.1.2.2 Any liquid described in 10.3.1.2.1, must not be transported in a large compartment tank as defined in AS 2809.1, if the ullage in the large compartment is more than 20% but less than 85%.

**NOTE 1:** 10.3.1.2.2 applies only to those tanks or compartments of a road tank vehicle that individually exceed 8,600 L. It does not apply to portable tanks, or to smaller tanks or compartments on the same vehicle.

**NOTE 2:** This ullage requirement corresponds to a restriction on the transport of a large compartment tank having a degree of filling of more than 15% but less than 80%.

**NOTE 3:** Different limits apply to the compartment sizes and degree of filling of portable tanks in 4.2.1.9.6.

10.3.1.2.3

10.3.1.2.2 does not apply to liquefied gases, or to TARS, LIQUID (UN 1999), or to elevated temperature liquids (UN 3256 and 3257), or to waste dangerous goods transported in vacuum tank vehicles.

10.3.1.3

### **Ullage—Class 2 refrigerated liquid**

If dangerous goods of Class 2 in the form of a refrigerated liquid are transferred into a tank vehicle, the tank must not be filled with liquid to the extent that, when the liquid is uniformly at the temperature which corresponds to the start-to-discharge pressure of:

- (a) the safety relief valve of the tank; or
- (b) where the tank is fitted with a pressure control valve in addition to a safety relief valve—the pressure control valve;

the ullage below the inlet to the valve is less than 2% when the tank is level.

**NOTE:** Consideration should also be given to *Portable Tank Instruction T75* and any *Portable Tank Special Provisions* specified for the substance in Column (11) of the *Dangerous Goods List* in chapter 3.2.

10.3.2

### **MAXIMUM PERMITTED FILLING RATIO - CLASS 2 LIQUID**

10.3.2.1

The maximum permitted filling ratio for a tank vehicle containing dangerous goods of Class 2 in a liquefied form (other than refrigerated liquid) is:

- (a) for goods covered under AS/NZS 1596, as specified in the filling instructions set out in that Standard;
- (b) for tank vehicles with a capacity of 5000L or more transporting propane, 0.45, as determined in accordance with Table 2.1 of AS 2809.3;
- (c) in all other circumstances, the relevant ratio specified in *Portable Tank Instruction T50* in chapter 4.2;
- (d) if paragraph (c) applies but no ratio is specified in *Portable Tank Instruction T50* – the ratio determined by a Competent Authority in relation to goods of that type when transferred into a tank of that type.

# **PART 11**

## **DOCUMENTATION**

## CHAPTER 11.1: TRANSPORT DOCUMENTATION

### Introductory Notes

**NOTE 1:** Documentation prepared in accordance with this Part may not be acceptable for sea or air transport. See the relevant modal code or chapter 5.4 of the UN Model Regulations for details of documentation required for intermodal transport by sea or air.

**NOTE 2:** The IATA “Shipper’s Declaration for Dangerous Goods” will also be acceptable under this Code as a transport document if all the required information is inserted.

**NOTE 3:** Division 11.1 of the Regulations specifies who must provide and carry dangerous goods transport documentation.

**NOTE 4:** Obligations relating to the retention of dangerous goods transport documentation are contained in regulation 11.1.8

### 11.1.1 DANGEROUS GOODS TRANSPORT INFORMATION

#### 11.1.1.1 General

11.1.1.1.1 Except as otherwise provided, the consignor who offers dangerous goods for transport shall give to the prime contractor the information applicable to those dangerous goods, including any additional information and documentation as specified in this Code. This information may be provided on a dangerous goods transport document or, with the agreement of the carrier, by EDP or EDI techniques.

11.1.1.1.2 When dangerous goods transport information is given to the prime contractor by EDP or EDI techniques, documentation must be carried in the vehicle in hard copy form.

11.1.1.1.3 When the dangerous goods transport information is given to the prime contractor by EDP or EDI techniques, the consignor shall be able to produce the information without delay as a paper document, with the information in the sequence required by this chapter.

#### 11.1.1.2 FORM OF THE TRANSPORT DOCUMENT

11.1.1.2.1 A dangerous goods transport document may be in any form, provided it contains all of the information required by this Code.

11.1.1.2.2 If both dangerous and non-dangerous goods are listed in one document, the dangerous goods must be listed first.

11.1.1.2.3 A dangerous goods transport document may consist of more than one page, provided pages are consecutively numbered.

11.1.1.2.4 The information on a dangerous goods transport document must be in English, easy to identify, legible and durable.

11.1.1.2.5 The form shown in Figure B1 in Appendix B is an example of the inter-modal dangerous goods transport document included in UN23, the IMDG Code and ADR, that may be suitable for sea or land transport. It may be used for transport in accordance with this Code if all information required by this chapter is inserted in the spaces provided. This does not preclude the use of other formats that meet the requirements of this chapter.

### 11.1.1.3 **CONSIGNOR, CONSIGNEE AND DATE**

11.1.1.3.1 The name and address of the consignor and the consignee of the dangerous goods must be included on the dangerous goods transport document, including the consignor's contact telephone number which:

- (a) for dangerous goods transported in bulk containers, portable tanks, tank vehicles, or receptacles with a capacity of more than 500 kg(L), should be the number of the 'telephone advisory service' provided under Regulation 14.2.1; or
- (b) whenever practicable, should be a number at which the consignor, or a person acting on behalf of the consignor, is accessible to answer questions relating to the goods consigned, whenever the goods are being transported.

11.1.1.3.2 The date the dangerous goods transport document or an electronic copy of it was prepared or given to the initial carrier must be included.

### 11.1.1.4 **INFORMATION REQUIRED ON THE DANGEROUS GOODS TRANSPORT DOCUMENT**

11.1.1.4.1 Dangerous Goods Description

The dangerous goods transport document must contain the following information for each type of dangerous good or article offered for transport:

- (a) the UN Number of the goods;
- (b) the proper shipping name of the goods or the name of the goods that appears on the packaging, article or other receptacle in which the goods are contained<sup>1</sup>;
- (c) the Class or Division of the goods;
- (d) each Subsidiary Hazard (if any) of the goods;
- (e) the packing group (if any) for the goods;
- (f) a description of each type of package or other receptacle to be transported, for example:
  - (i) "drum" or "DRM"; and
  - (ii) "intermediate bulk container" or "IBC";
- (g) the number of packages or receptacles of each type to be transported; and
- (h) except for empty uncleaned packagings, the aggregate quantity of dangerous goods covered by the description of each item of dangerous goods bearing a different proper shipping name, UN number

---

<sup>1</sup>When entered as part of a character string (e.g. on the intermodal dangerous goods form), the proper shipping name, supplemented where necessary by the technical name, must be used.

or packing group. For dangerous goods transported in salvage packagings, an estimate of the quantity of dangerous goods must be given.

**NOTE 1:** *The number, type and capacity of each inner packaging within the outer packaging of a combination packaging is not required to be indicated.*

**NOTE 2:** *The aggregate quantity of a type of dangerous goods required by 11.1.1.4.1(h) may be described by stating:*

- (a) *if the goods are a gas:*
  - (i) *the total capacity in litres of all gas receptacles in which those goods will be transported; or*
  - (ii) *if more convenient, the number of each type of receptacle in which the goods will be transported [as required by 11.1.1.4.1(g)] together with the capacity of each of those receptacles; or*
- (b) *if the goods are a liquid or a solid:*
  - (i) *the total amount, expressed in litres or kilograms, of dangerous goods of that type to be transported; or*
  - (ii) *if more convenient, the number of each type of package or other receptacle in which the goods will be transported [as required by 11.1.1.4.1(g)] together with the amount of dangerous goods each contains.*

11.1.1.4.2 Placement and Sequence of the Dangerous Goods Description

11.1.1.4.2.1 When describing a type of dangerous goods, the UN Number, name, Class or Division, Subsidiary Hazard and the packing group for the goods must appear before the other elements of the description.

11.1.1.4.2.2 Where the transport document is in the form of the Multimodal Dangerous Goods Form shown at Figure B<sup>1</sup>. in Appendix B, or any other format where the dangerous goods description is entered as a character string, the first five elements of the dangerous goods description specified in 11.1.1.4.1 must be shown in the order listed above (i.e. (a), (b), (c), (d), (e) with no information interspersed, except as provided in this Code.

e.g:“UN1098 ALLYL ALCOHOL 6.1 (3) I”; or

“UN1098, ALLYL ALCOHOL, Division 6.1, (Class 3), PG I”.

**NOTE 1:** *Knowledge of the actual location of dangerous goods within the cargo transport unit can be invaluable in an emergency. The inclusion of a sketch or other representation is encouraged where practicable.*

**NOTE 2:** *In addition to the requirements of this Code, other elements of information may be required by the competent authority or for certain modes of transport (e.g. flash point for sea transport). Unless permitted or required by this Code, additional information must be placed after the dangerous goods description.*

---

<sup>1</sup> This form may be printed from this Code using Appendix B as a proforma

#### 11.1.1.4.3

Information which supplements the proper shipping name in the dangerous goods description

The proper shipping name in the dangerous goods description must be supplemented as follows:

- (a) Technical names for “n.o.s.” and other generic descriptions: Proper shipping names that are assigned special provision 274 or 318 in Column 6 of the Dangerous Goods List must be supplemented with their technical or chemical group names as described in 3.1.2.8;
- (b) Empty uncleaned packagings, bulk containers and tanks: Empty means of containment (including packagings, IBCs, bulk containers, portable tanks, tank-vehicles and tank-wagons) which contain the residue of dangerous goods of classes other than Class 7 must be described as such by, for example, placing the words “**EMPTY UNCLEANED**” or “**RESIDUE LAST CONTAINED**” before or after the dangerous goods description specified in 11.1.1.4.1 (a) to (e); Empty, as yet unused dangerous goods prelabelled packagings should be clearly identified as such on documentation, outer packaging or vehicle to avoid inappropriate emergency response.
- (c) Wastes: For waste dangerous goods (other than radioactive wastes) which are being transported for disposal, or for processing for disposal, the proper shipping name must be preceded by the word “**WASTE**”, unless this is already a part of the proper shipping name;
- (d) Molten substances: when a substance, which is solid in accordance with the definition in 1.2.1, is offered for transport in the molten state, the qualifying word “**MOLTEN**” must be added as part of the proper shipping name, unless it is already part of the proper shipping name (see 3.1.2.5);
- (e) Elevated temperature substances: If the proper shipping name of a substance which is transported or offered for transport in a liquid state at a temperature equal to or exceeding 100 °C, or in a solid state at a temperature equal to or exceeding 240 °C, does not convey the elevated temperature condition (for example, by using the term “**MOLTEN**” or “**ELEVATED TEMPERATURE**” as part of the shipping name), the word “**HOT**” must immediately precede the proper shipping name;
- (f) Stabilized and temperature controlled substances: Unless already part of the proper shipping name the word “**STABILIZED**” must be added to the proper shipping name if stabilization is used and the words “**TEMPERATURE CONTROLLED**” must be added to the proper shipping name if stabilization is by temperature control or by a combination of chemical stabilization and temperature control (see 3.1.2.6).

#### 11.1.1.5

### INFORMATION REQUIRED IN ADDITION TO THE DANGEROUS GOODS DESCRIPTION

In addition to the dangerous goods description the following information must be included after the dangerous goods description on the

| <b>11.1.2</b>   | <b>SPECIAL DOCUMENTATION PROVISIONS</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>11.1.2.1</b> | <p><b>Combination road vehicles</b></p> <p>When dangerous goods are transported in a placard load on a combination road vehicle, the transport documentation must indicate which dangerous goods are stowed in each vehicle forming part of the combination.</p>                                                                                                                                                                                                                                                                                                                                 |
| <b>11.1.2.2</b> | <p><b>Amending documentation after unloading</b></p> <p>When part of a load of dangerous goods is unloaded from a vehicle, or transferred out of a tank, bulk container or freight container on the vehicle, the transport documentation must where practicable be amended to reflect the types and quantities of dangerous goods remaining on the vehicle.</p>                                                                                                                                                                                                                                  |

**NOTE:** 11.1.2.2 cannot be applied to tanks containing dangerous goods of Class 2 where the aggregate quantity in the tank is determined by the capacity of the tank and is not dependent on the degree of filling.

**11.1.2.3 DELETED**

**11.1.2.4 Goods Not Subject to this Code**

11.1.2.4.1 This sub-section applies to goods which are mentioned in the Dangerous Goods List in chapter 3.2 that are not subject to this Code because of a Special Provision referenced from Column (6) or because they have been determined by the Competent Authority not to be dangerous goods.

11.1.2.4.2 Goods described in 11.1.2.4.1 that are legitimately marked or labelled as dangerous goods under the IMDG, ICAO or IATA Code for transport by sea or air, may be described on transport documentation in accordance with the relevant Code.

11.1.2.4.3 When goods described in 11.1.2.4.1 are transported in a cargo transport unit that is placarded indicating the presence of dangerous goods and there is no documentation in accordance with 11.1.2.4.2, the transport documentation should indicate, in lieu of the dangerous goods description required by 11.1.1.1.4, that the goods are not subject to the ADG Code.

**11.1.3 ROAD TRANSPORT DOCUMENTATION**

11.1.3.1 Transport documentation must be carried in the cabin of each road vehicle transporting dangerous goods.

11.1.3.2 Every road vehicle transporting a placard load of dangerous goods must be fitted with an emergency information holder in accordance with chapter 11.2 and the transport documentation must be carried with the emergency information in that holder.

11.1.3.3 Every road vehicle transporting less than a placard load of dangerous goods must carry the documentation:

- (a) in any emergency information holder fitted in the cabin of the vehicle; or
- (b) where no emergency information holder is fitted, elsewhere in the cabin in a prominent location.

11.1.3.4 Despite 11.1.1.2, the documentation must be of a size, and be in a form, that is suitable for carrying in the emergency information holder.

#### 11.1.3.5

The documentation must not be in a sealed envelope or be otherwise kept in a way that would prevent it from being able to be read by the driver, while it is in the vehicle.

#### 11.1.4

### **RAIL TRANSPORT DOCUMENTATION**

For the rail journey, a train manifest may be used instead of transport documentation required by this chapter provided:

- (a) the train manifest contains, for each type of dangerous goods to be transported, the proper shipping name, the Class or Division and any Subsidiary Hazard, the UN Number, the packing group (if any), the aggregate quantity, the wagon number and the location on the train where the goods are loaded;
- (b) provision is made for the train manifest to be updated when the attachment or detachment of vehicles loaded with dangerous goods occurs; and
- (c) while ever the train is transporting dangerous goods, all of the information required by this chapter to be included on the documentation is available from a central location provided by the rail operator for which contact details are provided on or with the manifest.

## CHAPTER 11.2: EMERGENCY INFORMATION

**NOTE:** Division 11.2 of the Regulations requires emergency information to be carried on each road vehicle or train transporting dangerous goods in a placard load.

### 11.2.1

#### DEFINITIONS

In this chapter:

**Emergency information**, in relation to dangerous goods transported on a vehicle, means:

- (a) the Australian & New Zealand Emergency Response Guidebook (ANZ-ERG), as current at the time this edition of the ADG Code comes into force or a subsequent version<sup>1</sup> ; or
- (b) an emergency procedure guide for the dangerous goods transported on the vehicle and the emergency procedure guide in relation to vehicle fire; or
- (c) for use on trains transporting dangerous goods, the rail operator's Dangerous Goods Emergency Instructions for train crews which provides contact numbers for dangerous goods emergencies.

**Emergency procedure guide**, in relation to particular dangerous goods, is a guide outlining procedures to be taken in the event of an emergency involving the goods which is either:

- (a) in the form, or substantially in the form, of the relevant guide from the ANZ-ERG, provided that all relevant information referred to in that guide, e.g. information in Table 1, is included
- (b) in the form, or substantially in the form, of an emergency procedure guide for the goods published by Standards Australia; or
- (c) in a form approved by a Competent Authority in relation to goods of that kind.

**Emergency procedure guide**, in relation to vehicle fire, means a guide outlining procedures to be taken in the event of a fire on a road vehicle which is either:

- (a) in the form, or substantially in the form of Vehicle Fire Guide 00 in the ANZ-ERG;
- (b) in the form, or substantially in the form, of the emergency procedure guide for vehicle fire published by Standards Australia; or
- (c) in a form approved by a Competent Authority.

**Emergency information holder** means a holder:

- (a) of a size and shape suitable for carrying emergency information and transport documentation; and
- (b) marked with the words "emergency procedure guides" or "emergency information" in red letters at least 10 millimetres high on a white background.

---

<sup>1</sup>The ANZ-ERG is published on the NTC website.

## **11.2.2**

### **PLACEMENT OF EMERGENCY INFORMATION HOLDER**

#### **11.2.2.1**

An emergency information holder must be securely placed on a road vehicle:

- (a) on the inside of a door of the cabin; or
- (b) immediately adjacent to a door of the cabin; or
- (c) if the construction of the vehicle does not allow the holder to be attached to the inside of or adjacent to a cabin door - elsewhere in the cabin of the vehicle, provided that the position of the holder is identified on a notice affixed to the inside of the driver's door of the cabin.

#### **11.2.2.2**

Any emergency information holder that is located other than as specified in 11.2.2.1(a) must be visible and accessible.

# **PART 12**

## **SAFETY EQUIPMENT FOR ROAD VEHICLES**

## CHAPTER 12.1: SAFETY EQUIPMENT FOR ROAD VEHICLES

### 12.1.1

#### APPLICATION

Every road vehicle transporting a placard load of dangerous goods must be equipped with:

- (a) fire extinguishers in accordance with 12.1.2; and
- (b) at least three portable warning devices that comply with AS 3790 and are clean and in good condition; and
- (c) personal protective equipment and safety equipment in accordance with 12.1.3.

### 12.1.2

#### FIRE EXTINGUISHERS

#### 12.1.2.1

A road vehicle transporting a placard load of dangerous goods must be equipped with a fire extinguisher or fire extinguishers in good working order and in accordance with Table 12.1.

#### 12.1.2.2

On a combination vehicle, each separate unit on which a placard load of dangerous goods is transported must be equipped with fire extinguishers in good working order and in accordance with Table 12.1.

#### 12.1.2.3

A fire extinguisher required by this Section must comply with:

- (a) AS/NZS 1841.1 and AS/NZS 1850 and AS1851; and
- (b) AS/NZS 1841.4 or 5 as appropriate for the vehicle and load being carried.

#### 12.1.2.4

Each fire extinguisher required by this Section must be mounted securely by means of a quick-release attachment.

#### 12.1.2.5

Extinguisher Location

#### 12.1.2.5.1

Each fire extinguisher required by this Section must be located so as to be readily accessible for use.

#### 12.1.2.5.2

On road tank vehicles, fire extinguishers must be located and stowed in accordance with AS 2809.1.

#### 12.1.2.5.3

Where two or more fire extinguishers are required for the load area of any vehicle, one should be located on the left (near) side towards the rear of the vehicle and, wherever practicable, another should be mounted on the right (off) side towards the front of the vehicle.

#### 12.1.2.5.4

Except in the case of a combination vehicle, if only one fire extinguisher is required for any vehicle, wherever practicable it should be located:

- (a) on the discharge side of a road tank vehicle; or
- (b) in the cabin for all other vehicles.

#### 12.1.2.5.5

If 12.1.2.5.4 or Table 12.1 requires that a fire extinguisher be located in the cabin, as an alternative to being located in the cabin the fire extinguisher may be located directly behind the cabin or may be mounted on the rear of the cabin.

**Table 12.1: Minimum Fire Extinguisher Requirements for Road Vehicles Transporting a Placard Load of Dangerous Goods**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <p><b>Load:</b><br/> <b>Flammable goods packed in:</b></p> <ul style="list-style-type: none"> <li>• pressure drums, tubes, MEGCs, tanks, bulk containers (solids)</li> <li>• IBCs &gt; 10,000 L total capacity or containing &gt;10,000 kg. in total</li> </ul> <p><b>Required extinguishers:</b><br/> 2 x 60B dry powder, or 1x 80B dry powder and 1 x 20B foam, in the load area<br/> 1 x 10B dry powder in the cabin (see 12.1.2.5.5)</p>                                                                                                                                                     |

**NOTE 1:** In this table "flammable goods" means dangerous goods of Division 2.1, Class 3 or Class 4, or having a subsidiary hazard of 2.1, 3 or 4.

**NOTE 2:** In cases of combination vehicles, these directions apply to every separate trailer transporting a placard load.

**NOTE 3:** If more than one dry powder fire extinguisher is required in the load area, one may be replaced with a foam or water fire extinguisher of at least 9L capacity. If a foam or water fire extinguisher is used it must be suitable for the types of fire scenarios likely to be encountered and selected with the aim of preventing the spread of fire to the load.

**NOTE 4:** A foam or water firefighting system designed for the load using compressed air, electric pumps or other means, may be used in place of portable fire extinguishers in the load area. The firefighting system must be operational even when the engine of the vehicle is turned off and must be suitable for the types of fire scenarios likely to be encountered with the aim of preventing the spread of fire to the load.

## 12.1.3 PERSONAL PROTECTIVE EQUIPMENT AND SAFETY EQUIPMENT

12.1.3.1 Table 12.2 specifies the minimum personal protective and safety equipment that must be provided, based on the classification of the dangerous goods being transported.

- 12.1.3.2 A road vehicle transporting a placard load of dangerous goods must carry the personal protective equipment and safety equipment specified in Table 12.2 for all the dangerous goods in the load, based on their primary hazards and any subsidiary hazard, subject to any conditions incorporated in the table and its explanatory notes.
- 12.1.3.3 All personal protective equipment and safety equipment provided in accordance with this section must be:
- (a) clean; and
  - (b) suitable for purpose; and
  - (c) in sound operating condition, ready for use.
- 12.1.3.4 Personal protective equipment provided in accordance with this section must be in sufficient quantities for and suitable for use by:
- (a) the driver of the vehicle; and
  - (b) where required for escape purposes, any other persons travelling in the vehicle.
- 12.1.3.5 Respiratory protection equipment required to be carried for escape purposes must be carried securely and in an accessible position in the cabin of the vehicle.
- 12.1.3.6 Other personal protective equipment and safety equipment provided for occupants of a road vehicle transporting dangerous goods must be carried securely and in a readily accessible position in the vehicle.

**Table 12.2: Minimum Personal Protective and Safety Equipment on Road Vehicles transporting a Placard Load**

| Minimum Equipment Required                           | Class, Division or Subsidiary Hazard of Dangerous Goods in Load |     |     |     |     |                 |                  |     |     |     |     |     |
|------------------------------------------------------|-----------------------------------------------------------------|-----|-----|-----|-----|-----------------|------------------|-----|-----|-----|-----|-----|

| Respiratory protection equipment for escape purposes | No                                                              | No  | [b] | No  | No  | No              | No               | No  | [b] | No  | [b] | No  |
| Gas tight goggles or full face shield as appropriate | [c]                                                             | [c] | Yes | No  | No  | No              | Yes              | Yes | Yes | No  | Yes | No  |
| Eye-wash kit [d]                                     | No                                                              | No  | Yes | Yes | Yes | Yes             | Yes              | Yes | Yes | No  | Yes | Yes |
| Chemically resistant gloves or gauntlets             | No                                                              | No  | No  | Yes | Yes | Yes             | Yes              | Yes | Yes | Yes | Yes | Yes |
| Thermally insulated gloves or gauntlets              | Yes                                                             | Yes | Yes | No  | No  | No              | No               | No  | No  | No  | No  | [e] |
| Chemically resistant suit or coveralls               | No                                                              | No  | No  | No  | No  | No              | Yes              | Yes | Yes | No  | Yes | No  |
| Chemically resistant boots                           | No                                                              | No  | No  | No  | No  | No              | Yes              | Yes | Yes | No  | Yes | No  |
| Any electric torch                                   | No                                                              | Yes | Yes | No  | No  | Yes             | Yes              | No  | Yes | Yes | Yes | Yes |
| Electric torch com-                                  | Yes                                                             | No  | No  | Yes | Yes | No              | No               | Yes | No  | No  | No  | No  |

|                                                          |  |  |  |  |  |  |  |  |  |  |  |  |
|----------------------------------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|
| plying with AS/NZS 60079.11 or other recognised Standard |  |  |  |  |  |  |  |  |  |  |  |  |
|----------------------------------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|

**Table notes:**

- (a.) A vehicle transporting unodourised LP Gas, Butane or Propane must additionally be equipped with a gas detector suitable for detection of LP Gas, in accordance with AS 1596.
- (b.) The minimum requirement is a compressed air or compressed oxygen self-contained breathing apparatus, or chemical oxygen self-contained self-rescuer, certified to comply with AS/NZS 1716 and providing breathable air for not less than 15 minutes.

**Note 1:** *Respiratory protection equipment is not required where the dangerous goods will not give rise to harmful vapours, gases or dust, even in an emergency.*

**Note 2:** *Respiratory protection must be maintained in accordance with AS/NZS 1715,*

**Note 3:** *Where a driver attends to the loading or transfer of goods, SCBA with a duration of greater than 15 minutes may be required by other (e.g. health and safety) legislation.*

- (c.) **Yes** – if the goods are in receptacles with a capacity > 500 L or the goods are cryogenic liquids.

**No** – otherwise

“Gas tight goggles” means face hugging goggles with increased facial seal.

- (d.) Where an eyewash kit is required, it must be of at least 250 ml capacity, filled and ready for use.
- (e.) **Yes** – if the goods are elevated temperature substances or dry ice.

**No** - otherwise

**NOTE 1:** *Where an item of Personal Protective or Safety Equipment is required based on the primary hazard or subsidiary hazard of any item of dangerous goods in the load, that item must be carried, except that where thermally insulated gloves or gauntlets are required and carried, any requirement for chemically resistant gloves or gauntlets may be ignored*

**NOTE 2:** *Under other legislation, it may be necessary to carry additional Personal Protective Equipment where it is specified for the purpose on the Safety Data Sheet.*

# **PART 13**

## **PROCEDURES DURING ROAD TRANSPORT**

## CHAPTER 13.1: PROCEDURES DURING TRANSPORT

### 13.1.1 APPLICATION

This chapter applies only to road vehicles transporting a placard load of dangerous goods.

### 13.1.2 BREAKDOWNS

#### 13.1.2.1 General Measures

If a road vehicle transporting dangerous goods is disabled on a road or street, or has stopped and constitutes a traffic hazard, other road users must be alerted by:

- (a) if:
  - (i) the battery has not been disconnected to prevent danger and there are flashing hazard lights on the vehicle—turning the hazard lights on and leaving them on while the vehicle is stopped; or
  - (ii) the battery has not been disconnected to prevent danger and there are no flashing hazard lights on the vehicle—turning the parking lights on and leaving them on while the vehicle is stopped; and
- (b) placing a portable warning device in a manner required by 13.1.2.2

#### 13.1.2.2 Placement of portable warning triangles

The portable warning triangles must be placed as follows:

- (a) if the speed limit for the road is 80 kilometres per hour or more:
  - (i) 1 triangle at least 200 metres, but not over 250 metres, behind the vehicle; and
  - (ii) if the vehicle is on a one-way or divided road, 1 triangle between the triangle required by paragraph (i) and the vehicle; and
  - (iii) if the vehicle is not on a one-way road or divided road, 1 triangle at least 200 metres, but not over 250 metres, in front of the vehicle or fallen load; and
  - (iv) 1 triangle at the side of the vehicle closer to traffic;
- (b) if the speed limit for the road is less than 80 kilometres per hour:
  - (i) 1 triangle at least 50 metres, but not over 150 metres, behind the vehicle; and
  - (ii) if the vehicle is on a one-way or divided road, 1 triangle between the triangle required by paragraph (i) and the vehicle; and
  - (iii) if the vehicle is not on a one-way road or divided road, 1 triangle at least 50 metres, but not over 150 metres, in front of the vehicle or fallen load; and
  - (iv) 1 triangle at the side of the vehicle closer to traffic.

**NOTE:** Regulation 13.1.1 of the Model subordinate instrument provides that a driver who complies with an Australian Road Rule requiring the

*placement of portable warning triangles does not need to comply with the requirements in Part 13 with respect to portable warning devices.*

### **13.1.3**

## **GENERAL PRECAUTIONS DURING TRANSPORT**

### **13.1.3.1**

#### **Passengers**

No person apart from the following may ride in the cabin of a road vehicle transporting dangerous goods:

- (a) an authorised officer, police officer or officer of an emergency service, or a person authorised to ride in the vehicle by such a person; or
- (b) an employee of, or other person authorised to ride in the vehicle by, the owner of the vehicle or the prime contractor.

### **13.1.3.2**

#### **Parking requirements**

#### **13.1.3.2.1**

On parking a road vehicle transporting dangerous goods:

- (a) the parking brake must be fully applied; and
- (b) if the vehicle is powered by a compression ignition engine, the vehicle must not be parked in gear unless:
  - (i) the vehicle is fitted with a device to prevent the engine from starting if the vehicle moves; and
  - (ii) the device is engaged

#### **13.1.3.2.2**

Where a vehicle may be parked

#### **13.1.3.2.2.1**

A road vehicle transporting dangerous goods must not be parked or left standing:

- (a) in a built-up area with public access; or
- (b) within 15 metres of any building in which there is or is likely to be a concentration of people (other than a building on premises where the vehicle is loaded or unloaded); or
- (c) at any other place in which there is or is likely to be a concentration of people; or
- (d) within 8 metres of another vehicle which is transporting placarded dangerous goods.

#### **13.1.3.2.2.2**

Despite 13.1.3.2.2.1, a vehicle may be parked or left standing in circumstances mentioned in 13.1.3.2.2.1 if:

- (a) it is reasonably necessary to do so:
  - (i) for the purpose of loading or unloading dangerous goods onto or from the vehicle; or
  - (ii) because the vehicle has broken down; or
  - (iii) because of a dangerous situation involving the vehicle; or
  - (iv) to comply with the requirement of any law; or
  - (v) for a brief rest or refreshment break; or
  - (vi) for the normal operation of the vehicle, such as a bitumen spray vehicle; and

the vehicle is not parked or left standing for any longer than is necessary and the dangerous goods are kept secure; or

- (b) the Competent Authority or other local, State or Territory authority responsible for regulating the use or parking of vehicles has approved the place as a place in which vehicles transporting dangerous goods may be parked or left standing.
- 13.1.3.2.2.3 A vehicle transporting dangerous goods of Division 2.1 or Class 3, 4 or 5 or with a Subsidiary Hazard of 2.1, 3, 4 or 5 must not be parked or left standing within 15 metres of a naked flame.
- 13.1.3.2.2.4 13.1.3.2.2.1(d) does not apply to a road vehicle transporting dangerous goods that is parked or left standing in an area to which there is no public access.
- 13.1.3.2.2.5 Despite 13.1.3.2.2.1, a vehicle carrying BATTERIES, WET, FILLED WITH ACID, electric storage (UN 2794) that each have a gross mass of 65kg or less, and that together have a gross mass of 5000 kg or less, may:
  - (a) park in a public place if:
    - (i) in the case of an enclosed vehicle, the load area is locked; or
    - (ii) in the case of a tray-sided vehicle, the load is covered, or the vehicle is supervised; and
  - (b) be garaged in a residential area if:
    - (i) in the case of an enclosed vehicle, the load area is locked; or
    - (ii) in the case of a tray-sided vehicle, the garage is locked.
- 13.1.3.2.2.6 However, 13.1.3.2.2.5 only applies if the transport documentation for the load states the number of batteries in the load, and if that number is adjusted after each delivery so that it accurately states the number of batteries in the load at all times.

### 13.1.3.3 **Unloading the vehicle<sup>1</sup>**

Other than for transfer to another vehicle or to another mode of transport, dangerous goods must not be unloaded from a road vehicle unless:

- (a) the consignee, or a person acting on the consignee's behalf, is present and receives the goods; or
- (b) if the driver, prime contractor or consignor has agreed with the consignee for the goods to be unloaded into a secure place, the goods are unloaded into that place.

### 13.1.3.4 **Detaching a trailer from a prime mover or combination road vehicle**

A trailer containing dangerous goods must not be detached from a prime mover or a combination road vehicle other than:

- (a) at a vehicle marshalling area, designated by a local, State or Territory authority, where the loading and unloading of goods is permitted; or
- (b) at a transport depot designed for the loading and unloading of goods; or

---

<sup>1</sup> The Regulations may allow for unloading in emergency situations.

- (c) for the purposes of immediate exchange of trailers between prime movers or combination road vehicles, provided this is carried out off road and security is maintained; or
- (d) in an emergency requiring the trailer to be detached in the interests of safety; or
- (e) in the event of the vehicle becoming disabled on a road or street.

#### **13.1.3.5**

#### **Operation of burners**

##### **13.1.3.5.1**

Except as provided in 13.1.3.5.2. where a road tank vehicle is equipped with a burner to heat the load, the burner must not be operated when the vehicle is moving.

##### **13.1.3.5.2**

Burners may be operated on moving bitumen tankers if done in accordance with AS 2809.5, however the burner on a spray vehicle must not be operated when the vehicle is spraying bitumen.

#### **13.1.4**

#### **ROUTES**

##### **13.1.4.1**

Routes for road vehicles transporting dangerous goods must be pre-planned whenever possible to the extent practicable, taking into account the factors in this Section<sup>1</sup>.

##### **13.1.4.2**

Routes should be selected to minimise the risk of personal injury or harm to the environment or property during the journey.

##### **13.1.4.3**

Routes should wherever practicable avoid heavily populated or environmentally sensitive areas, congested crossings, tunnels, narrow streets, alleys, or sites where there may be, a concentration of people.

##### **13.1.4.4**

A road vehicle transporting dangerous goods must observe any requirements or restrictions on the selection of routes or times of travel which have been determined by the Competent Authority.

---

<sup>1</sup>While it is not always practicable to pre-plan in detail the route of a courier or local pick-up or delivery vehicle, the driver should nonetheless be made aware of any areas to avoid in localities where travel is anticipated.

# APPENDICES

## APPENDIX A:

### GOODS TOO DANGEROUS TO BE TRANSPORTED

- A1 Appendix A lists a number of substances and articles which are considered to be goods too dangerous to be transported.
- A2 If an entry in this Appendix includes the expression 'N.E.S.', it refers to goods not elsewhere specified. In those cases, the goods named in this entry are also named in one or more entries in the Dangerous Goods Lists in Chapter 3.2. An entry in the Dangerous Goods Lists describes goods of that name that may be transported. For example, it may be possible to transport a substance in compliance with this Code after mixing it with diluents, stabilisers, inhibitors, desensitisers, phlegmatisers, solvents, wetting agents or adulterants, as specified in the Dangerous Goods List, to overcome the instability inherent in the goods. The entry in this Appendix refers to goods that do not meet the description specified in the Dangerous Goods Lists and any associated Special Provisions in Chapter 3.3.
- A3 The list in this Appendix is not an exhaustive listing of goods too dangerous to be transported (see 3.1.1.3).
- A4 Under Regulation 1.5.1(2)(a), the Competent Authority may determine that other goods are to be classified as goods too dangerous to be transported, or that goods listed in this Appendix are not too dangerous to be transported.
- A5 Some State and Territory legislation, that embodies the principles of the NOHSC National Standard on the Storage and Handling of Dangerous Goods, makes reference to this list and assigns a label or placard to these goods, for use when they are kept or handled on premises. The use of that label/placard is not authorised by this Code for transport purposes.

**Table A1: List of some goods too dangerous to be transported**

|                                                              |                                                                       |
|--------------------------------------------------------------|-----------------------------------------------------------------------|
| Acetyl acetone peroxide, N.E.S.                              | Antimony sulfide and chlorate, mixtures of                            |
| Acetyl benzoyl peroxide, N.E.S.                              | Arsenic sulfide and chlorate, mixtures of                             |
| Acetyl cyclohexane sulfonyl peroxide, N.E.S.                 | Ascaridole                                                            |
| Acetylene (liquefied)                                        | Azaurolic acid (salts of), N.E.S.                                     |
| Acetylene silver nitrate                                     | Azidodithiocarbonic acid                                              |
| Acetyl hydroperoxide, N.E.S. (Alt: Peracetic acid)           | Azidoethyl nitrate                                                    |
| Acetyl peroxide, N.E.S.                                      | Azido guanidine picrate, N.E.S.                                       |
| Acraldehyde, N.E.S. (Alt: Acrolein)                          | 5-Azido-1-hydroxy tetrazole                                           |
| Acroleic acid, N.E.S. (Alt: Acrylic acid)                    | Azido hydroxy tetrazole (mercury and silver salts)                    |
| Acrolein dimer, N.E.S.                                       | 3-Azido-1,2-propylene glycol dinitrate                                |
| Acrolein, N.E.S.                                             | Aziridine, N.E.S. (Alt: Ethyleneimine)                                |
| Acrylaldehyde, N.E.S. (Alt: Acrolein)                        | Azotetrazole, N.E.S.                                                  |
| Acryldehyde, N.E.S.                                          | Barium azide, N.E.S.                                                  |
| Acrylic acid , N.E.S.                                        | Benzene diazonium chloride, N.E.S.                                    |

| Methylamine dinitramine and dry salts thereof                                   | Nitrogen triiodide monoamine                                         |
| Methylamine nitroform                                                           | Nitroglycerin, liquid, N.E.S.                                        |
| Methylamine perchlorate, N.E.S.                                                 | Nitroguanidine, N.E.S.                                               |
| Methyl-1,3-butadiene, N.E.S. (Alt: Isoprene)                                    | Nitroguanidine nitrate                                               |
| Methylcyclohexanone peroxide(s), N.E.S.                                         | 1-Nitro hydantoin                                                    |
| Methyldichloroarsine                                                            | Nitroisobutanetriol trinitrate                                       |
| Methylene glycol dinitrate                                                      | Nitromannite, N.E.S.                                                 |
| Methyl ethyl ketone peroxide(s), N.E.S.                                         | <i>N</i> -Nitro- <i>N</i> -methylglycolamide nitrate                 |
| $\alpha$ -Methylglucoside tetranitrate                                          | 2-Nitro-2-methylpropanol nitrate                                     |
| $\alpha$ -Methylglycerol trinitrate                                             | <i>m</i> -Nitrophenyldinitro methane                                 |
| Methyl isobutyl ketone peroxide(s), N.E.S.                                      | Nitrostarch, N.E.S.                                                  |
| Methyl methacrylate monomer, N.E.S.                                             | Nitrosugars, N.E.S.                                                  |
| Methyl nitramine, metal salts of                                                | Octogen, N.E.S.                                                      |
| Methyl nitrate                                                                  | 1,7-Octadiene-3,5-diyne-1,8-dimethoxy-9-octadecynoic acid            |
| Methyl nitrite                                                                  | Organic peroxide type A, liquid                                      |
|                                                                                 | Organic peroxide type A, solid                                       |
|                                                                                 | Pentaerythrite tetranitrate, N.E.S.                                  |

|                                                                     |                                                            |
|---------------------------------------------------------------------|------------------------------------------------------------|
| Pentaerythritol tetranitrate, N.E.S.                                | Sulfur and chlorate, loose mixtures of                     |
| Pentanitroaniline, N.E.S.                                           | Sulfur trioxide, N.E.S.                                    |
| Peracetic acid, N.E.S.                                              | Sulfuric anhydride, N.E.S. (Alt: Sulfur trioxide)          |
| Perchloric acid, N.E.S.                                             | Tetraazido benzene quinone                                 |
| Peroxyacetic acid, N.E.S.                                           | Tetrachloromethyl perchlorate                              |
| PETN, N.E.S.                                                        | Tetraethylammonium perchlorate, N.E.S.                     |
| <i>m</i> -Phenylene diaminediperchlorate, N.E.S.                    | Tetrafluorohydrazine                                       |
| Phenylethylene, N.E.S. (Alt: Styrene monomer)                       | Tetrahydrofuran, N.E.S.                                    |
| Phosphorus (white or red) and a chlorate, mixtures of               | Tetramethylene diperoxide dicarbamide                      |
| Picric acid, N.E.S.                                                 | Tetranitrodiglycerin                                       |
| Potassium carbonyl                                                  | 2,3,4,6-Tetranitrophenol                                   |
| 2-Propenal, N.E.S. (Alt: Acrolein)                                  | 2,3,4,6-Tetranitrophenyl methyl nitramine                  |
| Propenenitrile, N.E.S. (Alt: Acrylonitrile)                         | 2,3,4,6-Tetranitrophenylnitramine                          |
| Propenoic acid, N.E.S. (Alt: Acrylic acid)                          | Tetranitroresorcinol, N.E.S.                               |
| Propionyl peroxide, N.E.S.                                          | 2,3,5,6-Tetranitroso-1,4-dinitrobenzene                    |
| Propylene aldehyde, N.E.S. (Alt: Crotonaldehyde)                    | 2,3,5,6-Tetranitroso nitrobenzene, N.E.S.                  |
| Propyleneimine, N.E.S.                                              | Tetrazine, N.E.S.                                          |
| Pyridine perchlorate                                                | Tetrazolylazide, N.E.S.                                    |
| Quebrachitol pentanitrate                                           | Titanium dichloride                                        |
| Selenium nitride                                                    | Tolyethylenes, mixed isomers, N.E.S. (Alt: Vinyl toluenes) |
| Self-reactive liquid type A                                         | Trichloroacetaldehyde, anhydrous, N.E.S. (Alt: Chloral)    |
| Self-reactive solid type A                                          | Trichloroacetic aldehyde, anhydrous, N.E.S. (Alt: Chloral) |
| Shaped charges (commercial) containing more than 220g of explosives | Trichloromethyl perchlorate                                |
| Silver acetylide, N.E.S.                                            | Trifluorochloroethylene, N.E.S.                            |
| Silver azide, N.E.S.                                                | Trifluoromonochloroethylene, N.E.S.                        |
| Silver chlorate, N.E.S.                                             | Triformoxime trinitrate                                    |
| Silver chlorite, N.E.S.                                             | Trimethylene glycol diperchlorate                          |
| Silver fulminate, N.E.S.                                            | Trimethylol nitromethane trinitrate                        |
| Silver oxalate, N.E.S.                                              | 2,2,4-Trimethylpentyl-2-peroxyphenoxy acetate, N.E.S.      |
| Silver perchlorate                                                  | 2,4,4-Trimethylpentyl-2-peroxyneodecanoate, N.E.S.         |
| Silver picrate, N.E.S.                                              | 1,3,5-Trimethyl-2,4,6-trinitrobenzene                      |
| Sodium dinitro- <i>o</i> -cresolate, N.E.S.                         | Trinitroacetic acid, N.E.S.                                |
| Sodium picramate, N.E.S.                                            | Trinitroacetoneitrile                                      |
| Sodium picryl peroxide                                              | Trinitroamine cobalt                                       |
| Sodium tetranitride                                                 | Trinitrobenzene, N.E.S.                                    |
| Styrene, monomer, N.E.S.                                            |                                                            |
| Sucrose octanitrate, N.E.S.                                         |                                                            |

Trinitrobenzoic acid, N.E.S.  
 2,4,6-Trinitro-1,3-diazobenzene  
 Trinitroethanol  
 Trinitroethylnitrate  
 Trinitromethane  
 1,3,5-Trinitronaphthalene  
 Trinitrophenol, N.E.S. (Alt: Picric acid)  
 2,4,6-Trinitrophenyl guanidine, N.E.S.  
 2,4,6-Trinitrophenyl nitramine  
 2,4,6-Trinitrophenyl trimethylol methyl  
 nitramine trinitrate, N.E.S.  
 2,4,6-Trinitroso-3-methyl nitraminoanisole  
 Trinitrotetramine cobalt nitrate  
 2,4,6-Trinitro-1,3,5-triazido benzene, N.E.S.  
 Tri-( $\beta$  -nitroxyethyl) ammonium nitrate  
 Tris-bis-bifluoroamino diethoxy propane  
 (TVOPA)  
 Urea nitrate, N.E.S.  
 Vinyl acetate, N.E.S.  
 Vinyl benzene, N.E.S. (Alt: Styrene,  
 monomer)  
 Vinyl bromide, N.E.S.  
 Vinyl-*n*-butylether, N.E.S. (Alt: Vinyl  
 butylether)  
 Vinyl butyrate, N.E.S.  
 Vinyl chloride, N.E.S.  
 Vinyl cyanide, N.E.S. (Alt: Acrylonitrile)  
 Vinyl ether, N.E.S. (Alt: Divinyl ether)  
 Vinyl ethyl ether, N.E.S.  
 Vinyl fluoride, N.E.S.  
 Vinylidene, N.E.S.  
 Vinyl isobutylether, N.E.S.  
 Vinyl methyl ether, N.E.S.  
 Vinyl nitrate polymer  
 Vinyl pyridines, N.E.S.  
 Vinyl toluenes, mixed isomers, N.E.S.  
 Vinyl trichlorosilane, N.E.S.  
*p*-Xylyl diazide  
 Zirconium picramate, N.E.S.

## APPENDIX B:

### FORMS

**NOTE 1:** Appendix B of UN23 is a Glossary of Terms relating to Explosives. That Glossary is repeated in the Australian Explosives Code. Where the symbol '†' is included in Column 2 of the Dangerous Goods List in Section 3.2.5 of this Code, this is an indication that reference should be made to Appendix B of UN23 or to Appendix 5 of the Australian Explosives Code.

**NOTE 2:** This appendix includes forms that are referenced in the text of this Code that may be useful when consigning or transporting dangerous goods, or in responding to emergencies. The use of these forms is not mandated by this Code or the Regulations. These forms may be printed from this publication by printing only the page number(s) of the required form.

#### **B1                      Multimodal Dangerous Goods Form**

**Figure B1** is a copy of the Multimodal Dangerous Goods Form, reproduced from Chapter 5.4 of UN23. Use of such a form is mandatory under the IMDG Code for sea transport of dangerous goods.

For road and rail transport in Australia, the actual format of the dangerous goods transport document is not mandated. Flexibility of transport documentation design is permitted within the constraints of Chapter 11.1, to allow for computer generated documentation and preprinted forms.

The Multimodal Dangerous Goods Form is, however, an acceptable form of documentation under this Code and may be useful for small consignments where details are entered by hand. Particular attention is drawn to the need to enter the dangerous goods details at Item 14 as a character string in a particular sequence (see 11.1.1.2.3).

If using this form as a transport document solely for transport of dangerous goods by road or rail within Australia, it is not necessary to complete those fields that are required by the international Codes but are not mandated in Part 11 of this Code.

#### **B2                      <DELETED>**

#### **B3                      <Relocated to Appendix C>**

**Figure B1: Multimodal Dangerous Goods Form**

\* FOR DANGEROUS GOODS you must specify: UN No., proper shipping name, hazard class, packing group (where assigned) and any other element of information required under applicable national and international regulations

|                                                                                                                                                                                                                                                                                                                                          |                                                     |                                                                                                                                                                                                                                                                                                                                                                       |                                 |                                            |

## **APPENDIX C:**

## **HAZCHEM CODES**

### **Introductory Note**

Appendix C contains information that has been reproduced from the Dangerous Goods Emergency Action Code List 2023, published by the Ricardo, in co-operation with the UK Home Office.

A copy of appendix C can be downloaded as a separate document from the NTC website.

A full copy of the Ricardo publication can be downloaded at <https://www.ricardo.com/en/news-and-insights/insights/dangerous-goods-emergency-action-code-list-2023#contact-us>. The NTC acknowledges the permission given by Ricardo for the use of the material.

## **APPENDIX D:**

### **CODE OF PRACTICE FOR REPROCESSING STEEL DRUMS**

**NOTE 1:** *This Appendix has the full title 'Code of Practice for the Reprocessing of Closed Head Steel Drums in the Nominal Capacity Range of 200-220 Litres'. Previous editions were published separately as Supplement 1 to earlier editions of this Code.*

**NOTE 2:** *Adherence to this Code of Practice is necessary in order to prevent those reprocessed drums which show unsatisfactory performance characteristics from being used in the transport of dangerous goods.*

#### **D1**

#### **SCOPE**

This mandatory Code of Practice has been prepared by the Advisory Committee on the Transport of Dangerous Goods. It is to be adhered to by those persons reprocessing non-removable head steel drums in the nominal capacity range of between 200 and 220 litres, for second and subsequent use of these drums in the transport of dangerous goods of packing groups II and III.

It recognises the long standing practice of the use of reprocessed drums for the transport of dangerous goods in Australia. The purpose of this Code of Practice is to afford a mechanism to control the quality of drums prior to subsequent use and to that end it sets out:

- (a) selection criteria for drums intended for second or subsequent use in transporting dangerous goods; and
- (b) reprocessing procedures to which such drums must be subjected.

Reprocessed drums must not be used for dangerous goods of packing group I.

Notwithstanding drums being reprocessed to the requirements of this Code of Practice, the responsibility for the selection and suitability of the drums for a particular purpose remains with the packer.

This Code of Practice is to be read in conjunction with this ADG Code.

#### **D2**

#### **DEFINITIONS AND PROHIBITED PRACTICES**

**Drum** for the purposes of this Code of Practice is a flat ended cylindrical receptacle made of metal with filling apertures in the body and/or in the top head, with or without rolling hoops or corrugations and with ends permanently fixed to the body by means such as seaming or welding and has a nominal capacity of 200 to 220 litres and commonly known as a closed or non-removable head steel drum.

**In House** describes the circumstances where a packer of dangerous goods reuses or launders drums on the packer's premises for the packer's own use but does not make such drums available to others as packagings for dangerous goods.

**Launder** means the action of washing the exterior and interior of drums and where necessary, repainting the exterior of the drums to obliterate

all previous package markings (other than packaging approval markings), with or without chaining or de-scaling the interior prior to filling.

**Packer** means a person who fills, or causes to be filled, the drum.

**Recondition** means the actions of both mechanical repair and laundering of drums involving processes which require reformation to original shape of any component by mechanical means, and repairs of holes by welding, but excludes the process of remaking.

**Remake** means the action of replacing one or both ends of a drum.

**Reuse** means the action of in-house refilling of drums with goods of a type chemically similar to the goods initially packed. Reuse does not include laundering, but rinsing and painting, if needed, are permitted.

**Reprocess** means the actions of either laundering or reconditioning drums.

**Rinsing** means the action of washing a drum with fluids whose residues need not be removed, other than by drying, before the drum is refilled.

**Weld** means the action of repairing a hole by welding. Welding does not include the placing of a patch.

Welding is not permitted on the bottom of a drum or within 50mm of a body seam, chime or flange.

Welding of holes longer than 15mm or those caused by corrosion or fatigue is not permitted.

### D3

## SELECTION OF DRUMS

A drum may be re-used or reprocessed for use with dangerous goods provided that:

- (a) the drum is selected for re-use, laundering or reconditioning, or rejection, in accordance with the criteria specified in the selection table in Section D9; and
- (b) the drum selected for reprocessing does not exhibit damage to a degree equivalent to those illustrations designated as 'NOT ACCEPTABLE' in the Pictorial Guide in Section D10 of this Code of Practice.

### D4

## EQUIPMENT

Reprocessors must possess both leak testing equipment and a set of scales. Both of these must be calibrated against Australian Standards or equivalent and only used within their calibration period. The following equipment is optional:

- washing machine
- spray painting equipment
- chaining or de-scaling equipment
- de-denter
- chime straightener.

Reprocessors who possess either a de-denter or a chime straightener (or both) will be deemed to be reconditioners.

All equipment must be adequately protected to minimise the risk of injury to equipment operators.

## **D5 TESTING OF DRUMS**

Except for drums which are only being re-used, every drum must be subjected to the following tests before being utilised for the transport of dangerous goods:

### **D5.1 Leakproofness Test**

Description of test:

A pressure of 20kPa must be applied using a test method approved by the Competent Authority.

Criteria for passing the test successfully:

There must be no leakage.

**NOTE:** *Leakproofness testing equipment must be adequately protected to minimise the risk of injury to equipment operators.*

### **D5.2 Tare Weight Test**

Description of test:

The clean empty reprocessed drum must be weighted to an accuracy of +/- 0.1 kg.

Criteria for passing the test successfully:

The mass of the drum must be not less than 15.5kg.

## **D6 MARKING OF DRUMS**

Drums reprocessed in accordance with this Code of Practice must be marked in accordance with Section 6.1.3.

## **D7 APPROVAL OF REPROCESSORS**

Each reprocessing facility must be approved as a laundering or reconditioning facility by the Competent Authority in whose jurisdiction the facility is located.

**NOTE:** *Details of approved drum reprocessors can be obtained from the Competent Authority.*

The following steps must be undertaken to obtain approval:

- (a) The reprocessor must make an application for approval to the Competent Authority. The application must be in writing and will:
  - (i) nominate responsible persons in charge of the reprocessing operation;
  - (ii) list the reprocessing equipment in the facility; (Essential and optional equipment for reprocessors is listed at D4 of this Code of Practice)
  - (iii) verify that all reprocessed drums, prior to being placed into dangerous goods service will have:

- had their tare mass determined;
- passed through all necessary processes in this Code of Practice; and
- been leak tested;

- (iv) nominate an identifying mark for use under D6.
- (b) Following receipt of an application completed in accordance with (a), the Competent Authority will inspect the reprocessor's premises and witness all the equipment listed under (a)(ii) in operation. (The level of equipment will depend on whether a reconditioner or launderer is being inspected). For this inspection, leak testing equipment must be set up and equipped with an accurate gauge.
- (c) If satisfied with the site inspection under (b) the Competent Authority will grant written approval to the reprocessor. The approval will include a confirmation of the identifying mark nominated in (a)(iv) and advice of approval as a 'reconditioner' or a 'launderer'.
- (d) The Competent Authority will fully re-inspect the reprocessor's premises at least biennially.

## **D8**

### **TRAINING**

It is a requirement of this Code of Practice that reprocessor's staff involved in the reprocessing of drums for use in the transport of dangerous goods are trained in the drum selection procedures and the procedures for reprocessing and testing contained in this Code of Practice.

## **D9**

### **DRUM AND PROCESS SELECTION**

To be suitable for reuse, laundering or reconditioning for packaging dangerous goods, a drum must:

- (a) be an approved drum, complying with Chapter 6.1 of this Code, as verified by markings in accordance with 6.1.3;
- (b) have a minimum tare mass of 15.5 kg; and
- (c) not be damaged to such an extent that, after reprocessing, it may not be capable of meeting the performance tests of this Code applicable to drums for their intended service.

Detailed criteria to be applied to the selection of drum suitable for reprocessing are provided in Table D overleaf. This table also indicates what processing is required for different types of damage.

This table should be used for segregating drums into those to be reused and those which are candidates for reprocessing or rejection.

The pictorial guide provided at D10, must be used to assist in interpreting damage levels referred to in Table D.

#### **Table D: Reprocessing Criteria and Options**

| CRITERIA FOR SELECTION                            |                               | PROCESS OPTION |         |             |        |
|---------------------------------------------------|-------------------------------|----------------|---------|-------------|--------|
|                                                   |                               | Reuse          | Laundry | Recondition | Reject |
| <b>Criteria based on Original (as new) status</b> |                               |                |         |             |        |
| Approved drums 1                                  |                               | 2              | 2       | 2           | 2      |
| Unapproved drums                                  |                               | -              | -       | -           | 3      |
| <b>Weight Criterion</b>                           |                               |                |         |             |        |
| Minimum Tare Mass: - Nominally > 15.5 kg          |                               | 2              | 2       | 2           | 2      |

#### Key to Table D:

1. 'Approved' means the drum has been originally approved in accordance with this Code and is marked accordingly.
2. Denotes an acceptable option.
3. Denotes mandatory action.

**NOTE:** Any drum, irrespective of the extent of damage, may be rejected.

## D10

### PICTORIAL GUIDE

This section provides illustrations of drums which have been used for the transport of dangerous goods and have suffered varying degrees of damage. The reprocessor must examine each drum received to determine the extent of its damage and the type of reprocessing to be undertaken in order to render it suitable to be used in the transport of dangerous goods.

The illustrations are designed to provide guidance to reprocessors in the selection of drums based on the condition of the drum. Drums suffering damage to a degree equivalent to those illustrations designated as 'NOT ACCEPTABLE' must not be reprocessed for use with dangerous goods. The illustrations have been reproduced, with permission, from the Shell publication 'Guidelines for the Selection of Used Drums'.

This pictorial guide should be used in conjunction with the Selection Guide in Table D.

#### Figure D1: Reprocessing steel drums – dents

A large dent. NOT ACCEPTABLE  
The dent is too deep to be blown out satisfactorily.  
Note the damage to the swedged rolling hoops.  
These sharp indents are potential leak areas.

Major body denting. NOT ACCEPTABLE  
The dents cannot be blown out.  
Note the damage to the swedged rolling hoops.  
The sharp indentations will be the site of leaks.

Deep dents. NOT ACCEPTABLE  
The 5 dents shown in the photo are too deep to be blown out successfully.  
Note the sharp dents in both swedged rolling hoops, which are potential leak areas.

Shallow dents.  
ACCEPTABLE.  
Can be blown out sufficiently to make the drum usable.

**Figure D2: Reprocessing steel drums – chime and head damage**

Two photos of the same damage. NOT ACCEPTABLE.

Dent in chime is too deep to be rolled out.

Any attempt will result in splitting of chime and cracking of the drum body.

NOT ACCEPTABLE.

The chime dent can be hammered out to enable the drum to fit the rollers.

The dent can then be rolled out further but in doing so the buckles in the head could be cut by the rollers resulting in leaks.

NOT ACCEPTABLE.

The chime cannot be re-rolled nor can the dent in the body be blown out.
