## **INFORMATION ON COMPETENT AUTHORITY PANEL DECISIONS**

The Competent Authorities Panel (CAP) is a body whose prime responsibility is to consider submissions requesting national exemptions, determinations and classifications that may operate at variance to ADG 7.9.

CAP generally meets twice a year and considers submissions from industry and industry associations. Submissions to CAP for either an exemption, approval or administrative determination must first be considered by the Competent Authority in the relevant jurisdiction to ensure that the matter is of national effect and the submission is complete and in accordance with the Regulations.

The Secretariat for CAP is provided by the National Transport Commission (NTC). When submitting an application to CAP through your Competent Authority it is essential that you use the pro-forma, see NTC website below, and provide adequate supporting information for Panel members to consider. This may include diagrams, photographic material and other technical information. When applying for an Exemption the submission material must demonstrate 'equivalent safety'. If you are uncertain of what to provide to support your submission contact your Competent Authority to discuss the matter.

| 2.1.2 COMPATIBILITY GROUPS .....                                                                                                                          | 79  |
| 2.1.3 CLASSIFICATION PROCEDURE .....                                                                                                                      | 82  |
|                                                                                                                                                           | 87  |
| CHAPTER 2.2: CLASS 2 - GASES .....                                                                                                                        | 100 |
| 2.2.1 DEFINITIONS AND GENERAL PROVISIONS .....                                                                                                            | 100 |
| 2.2.2 DIVISIONS .....                                                                                                                                     | 100 |
| 2.2.3 MIXTURES OF GASES .....                                                                                                                             | 101 |
| 2.2.4 GASES NOT ACCEPTED FOR TRANSPORT .....                                                                                                              | 103 |
| CHAPTER 2.3: CLASS 3 – FLAMMABLE LIQUIDS .....                                                                                                            | 104 |
| Introductory Notes .....                                                                                                                                  | 104 |
| 2.3.1 DEFINITION AND GENERAL PROVISIONS .....                                                                                                             | 104 |
| 2.3.2 ASSIGNMENT OF PACKING GROUPS .....                                                                                                                  | 105 |
| 2.3.3 DETERMINATION OF FLASH POINT .....                                                                                                                  | 107 |
| 2.3.4 DETERMINATION OF INITIAL BOILING POINT .....                                                                                                        | 107 |
| 2.3.5 SUBSTANCES NOT ACCEPTED FOR TRANSPORT .....                                                                                                         | 108 |
| CHAPTER 2.4: CLASS 4 - FLAMMABLE SOLIDS; SUBSTANCES LIABLE TO SPONTANEOUS COMBUSTION; SUBSTANCES WHICH, IN CONTACT WITH WATER, EMIT FLAMMABLE GASES ..... | 109 |
| Introductory Notes .....                                                                                                                                  | 109 |
| 2.4.1 DEFINITIONS AND GENERAL PROVISIONS .....                                                                                                            | 109 |
| 2.4.2 DIVISION 4.1 - FLAMMABLE SOLIDS, SELF-REACTIVE SUBSTANCES, SOLID DESENSITISED EXPLOSIVES AND POLYMERIZING SUBSTANCES .....                          | 110 |
| 2.4.3 DIVISION 4.2 - SUBSTANCES LIABLE TO SPONTANEOUS COMBUSTION .....                                                                                    | 123 |
| 2.4.4 DIVISION 4.3 - SUBSTANCES WHICH IN CONTACT WITH WATER EMIT FLAMMABLE GASES .....                                                                    | 125 |
| 2.4.5 CLASSIFICATION OF ORGANOMETALLIC SUBSTANCES .....                                                                                                   | 126 |
| CHAPTER 2.5: CLASS 5 - OXIDISING SUBSTANCES AND ORGANIC PEROXIDES .....                                                                                   | 128 |
| Introductory Note .....                                                                                                                                   | 128 |
| 2.5.1 DEFINITIONS AND GENERAL PROVISIONS .....                                                                                                            | 128 |
| 2.5.2 DIVISION 5.1 - OXIDISING SUBSTANCES .....                                                                                                           | 128 |
| 2.5.3 DIVISION 5.2 - ORGANIC PEROXIDES .....                                                                                                              | 131 |

|                                                                                                                              |            |
|------------------------------------------------------------------------------------------------------------------------------|------------|
| CHAPTER 2.6: CLASS 6 – TOXIC SUBSTANCES AND INFECTIOUS SUBSTANCES .....                                                      | 162        |
| Introductory Notes .....                                                                                                     | 162        |
| 2.6.1 DEFINITIONS .....                                                                                                      | 162        |
| 2.6.2 DIVISION 6.1 - TOXIC SUBSTANCES .....                                                                                  | 162        |
| 2.6.3 DIVISION 6.2 - INFECTIOUS SUBSTANCES .....                                                                             | 169        |
| CHAPTER 2.7: CLASS 7 - RADIOACTIVE MATERIAL .....                                                                            | 177        |
| Introductory Notes .....                                                                                                     | 177        |
| 2.7.1 DELETED .....                                                                                                          | 177        |
| 2.7.2 CLASSIFICATION .....                                                                                                   | 177        |
| CHAPTER 2.8: CLASS 8 - CORROSIVE SUBSTANCES .....                                                                            | 180        |
| 2.8.1 DEFINITION AND GENERAL PROVISIONS .....                                                                                | 180        |
| 2.8.2 GENERAL CLASSIFICATION PROVISIONS .....                                                                                | 180        |
| 2.8.3 PACKING GROUP ASSIGNMENT FOR SUBSTANCES AND MIXTURES .....                                                             | 180        |
| 2.8.4 ALTERNATIVE PACKING GROUP ASSIGNMENT METHODS FOR MIXTURES: Step-wise approach .....                                    | 182        |
| 2.8.5 SUBSTANCES NOT ACCEPTED FOR TRANSPORT .....                                                                            | 186        |
| CHAPTER 2.9: CLASS 9 - MISCELLANEOUS DANGEROUS SUBSTANCES AND ARTICLES, INCLUDING ENVIRONMENTALLY HAZARDOUS SUBSTANCES ..... | 187        |
| 2.9.1 DEFINITIONS .....                                                                                                      | 187        |
| 2.9.2 ASSIGNMENT TO CLASS 9 .....                                                                                            | 187        |
| 2.9.3 ENVIRONMENTALLY HAZARDOUS SUBSTANCES (AQUATIC ENVIRONMENT) .....                                                       | 190        |
| 2.9.4 LITHIUM BATTERIES .....                                                                                                | 205        |
| 2.9.5 SODIUM ION BATTERIES .....                                                                                             | 207        |
| <b>PART 3 .....</b>                                                                                                          | <b>209</b> |

## INTRODUCTION

### Acknowledgements

The National Transport Commission wishes to acknowledge the valuable contributions in producing the Australian Dangerous Goods Code.

Agencies that contributed to the development of this publication include:

- Australasian Fire and Emergency Service Authorities Council (AFAC)
- Australian Maritime Safety Authority (AMSA)
- Access Canberra, Australian Capital Territory
- Civil Aviation Safety Authority (CASA)
- Department of Infrastructure, Transport, Regional Development, Communications and the Arts
- NSW Environment Protection Authority
- SafeWork New South Wales
- Northern Territory WorkSafe
- Department of Resources, Queensland
- Department of Transport and Main Roads, Queensland
- Safework South Australia
- WorkSafe Tasmania
- WorkSafe Victoria
- Department of Mines, Industry Regulation and Safety, Western Australia.

The NTC would like to thank the many industries; individual businesses, both small and large; industry groups; professional groups and individuals who contributed to this publication by public, private, written and verbal submissions, and all of those who provided comments on draft publications to the commission.

The NTC also acknowledges the permission given by the United Nations for use of material from the Recommendations on the Transport of Dangerous Goods Model Regulations, Twenty third revised edition, United Nations, 2023.

# About the Australian Code for the Transport of Dangerous Goods by Road & Rail

## Forward

Every Australian has a responsibility to do what they can to keep our roads and other transport networks safe. This principle is especially important for those who are part of the supply chain that transports dangerous goods. This Australian Code for the Transport of Dangerous Goods by Road & Rail, commonly known as the Australian Dangerous Goods Code (edition 7.9, 2024) sets out the requirements for transporting dangerous goods by road and rail.

**The Code can be used from 1 October 2024 and is compulsory from 1 October 2025. Until then, either the Code edition 7.8 or the Code edition 7.9 can be used.**

The Code is an important technical resource to help Australia's transport and logistics industry to operate safely when carrying dangerous goods. It is important that all members of the supply chain understand and work to the requirements of the Code, including the consignor, packer, truck driver and dangerous goods transport companies, along with dangerous goods professionals and trainers.

The Code is aligned to the United Nations recommendations on the Transport of Dangerous Goods Model Regulations (23rd revised edition) and also includes specific provisions that better reflect current Australian practices and conditions.

## Contents of the Code

The Code applies to the dangerous goods classified as:

- gases, Class 2
- flammable liquids, Class 3
- flammable solids, self-reactive and desensitized explosives, Division 4.1
- substances liable to spontaneous combust, Division 4.2
- substances dangerous if wet, Division 4.3
- oxidizing substances, Division 5.1
- organic peroxides, Division 5.2
- toxic substances, Division 6.1
- infectious substances, Division 6.2(\*)
- corrosive substances, Class 8
- miscellaneous dangerous substances and articles and environmentally hazardous substances, Class 9.

(\*) Refer to the relevant Competent Authority to determine the appropriate regulator for this substance.

The Code details the requirements for:

- classification of substances
- packaging and performance testing
- use of bulk containers, IBCs, freight containers and unit loads
- marking and placarding
- vehicle requirements
- segregation and stowage
- transfer of bulk dangerous goods
- documentation
- safety equipment
- procedures during transport emergencies.

## Using the Code

The Code details the technical requirements to transport dangerous goods.

The Code should be read in conjunction with the specific dangerous goods transport legislation that have been enacted in the relevant state or territory. The details of the legislation in each jurisdiction can be found on the Commonwealth Department of Infrastructure, Transport, Regional Development, Communications and the Arts website at: <https://www.infrastructure.gov.au/infrastructure-transport-vehicles/transport-strategy-policy/transport-australia/transport-dangerous-goods/transport-dangerous-goods-road-and-rail-legislation-status>.

The jurisdictional legislation is based on the Model Act on the Transport of Dangerous Goods by Road and Rail and the Model Subordinate Instrument on the Transport of Dangerous Goods by Road and Rail.

The legislation sets out specific legal requirements for transporting dangerous goods by both road and rail. The legislation identifies the responsible industry employees in the transport of dangerous goods and imposes obligations and penalties (for failure of duty) on each of those in the land transport chain to ensure that dangerous goods are transported safely. The basis of the duties and responsibilities outlined in the model subordinate instrument are the technical requirements set out in this Code.

The Code and associated legislation do NOT cover:

|                                                                                            |                                               |
|--------------------------------------------------------------------------------------------|-----------------------------------------------|
| Transport of explosives (Class 1)                                                          | Unless transported with other dangerous goods |
| Transport of radioactive materials (Class 7)                                               |                                               |
| Security provisions associated with Security Sensitive Ammonium Nitrate (SSAN)             |                                               |
| Usage, storage or security of dangerous goods,                                             |                                               |
| Transport of waste or environmentally hazardous products, unless they are a dangerous good |                                               |

Please contact the jurisdictional Competent Authority or relevant jurisdictional authority in relation to these substances.

The Australian Dangerous Goods Code is a technical resource for Australia setting out requirements and guidelines for the transport of dangerous goods. The Code only sets out requirements and guidelines relating to the transport of explosives and radioactive materials where these goods are transported together with other dangerous goods, or where the dangerous goods have a subsidiary hazard of another class. For completeness and international uniformity, the Code includes the full Dangerous Goods List and the classification criteria for all classes and divisions of dangerous goods.

The Code is a resource on dangerous goods that is used as a reference point for all aspects of dangerous goods. However, the primary focus is on the safe transportation of these goods by road and rail. It does not contain any provisions relating to usage, storage or security of these goods. The code may act as a starting point or as a source of information requiring further development in these areas or other legislation may be required to be reviewed for compliance with these issues.

Provisions of this Code dealing with **Class 1 (Explosives), Class 7 (Radioactive substances or articles), Division 6.2 infectious substances and waste products** should be read subject to Division 1.1 (Introduction and Application) of the Model Subordinate Instrument on the Transport of Dangerous Goods by Road or Rail and the following:

- Requirements in this Code relating to the transport of **explosives** are subject to the requirements of the laws of a state, territory or the Commonwealth relating to the transport of explosives. Rules for the transport of explosives are in the Australian Explosives Code, (<https://www.safeworkaustralia.gov.au/doc/australian-code-transport-explosives-road-and-rail-3rd-edition>.)
- Any provision in this Code for **Class 1** goods is advisory and for information purposes only, unless it is referenced by other legislation. These requirements should also be read in conjunction with the legislation applicable in each jurisdiction and to Security Sensitive Ammonium Nitrate (SSAN) legislation.
- Requirements relating to the transport of **radioactive substances** are subject to state or territory Acts and regulations and are based on the Code for the Safe Transport of Radioactive Material (2019) published by the Australian Radiation Protection and Nuclear Safety Agency: <https://www.arpsa.gov.au/regulation-and-licensing/regulatory-publications/radiation-protection-series/codes-and-standards/rpsc-2>.
- Any provision in this Code for **Class 7** is advisory and for information purposes only, unless it is referenced by other legislation.
- In addition, the requirements relating to Division 6.2 for the transport of infectious substances may be subject to the requirements of state, territory or Commonwealth law relating to the transport of infectious substances.
- The requirements of this code do not apply to **waste products and other environmentally hazardous substances** unless those products or substances are also

dangerous goods as specified in the code. Enquiries regarding the transport of waste and other environmentally hazardous substances should be directed to the relevant state or territory authority responsible for administering environment protection legislation.

# **PART 1**

## **GENERAL PROVISIONS, DEFINITIONS AND INTERPRETATION**

# CHAPTER 1.1: GENERAL PROVISIONS

## Introductory Notes

**NOTE 1:** *Recommendations on Tests and Criteria, which are incorporated by reference into certain provisions of UN23 and this Code are published by the United Nations as a separate Manual “Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria” (ST/SG/AC.10/11/Rev.7 and Amend 1), the contents of which are:*

*Part I: Classification procedures, test methods and criteria relating to explosives.*

*Part II: Classification procedures, test methods and criteria relating to self-reactive substances, organic peroxides and polymerizing substances.*

*Part III: Classification procedures, test methods and criteria relating to various hazard classes.*

*Part IV: Test methods concerning transport equipment.*

*Part V: Classification procedures, test methods and criteria relating to sectors other than transport.*

*Appendices: Information common to a number of different types of tests and national contacts for test details.*

**NOTE 2:** *Part III of the Manual of Tests and Criteria contains some classification procedures, test methods and criteria which are also given in this Code.*

### 1.1.1

### SCOPE AND APPLICATION

#### 1.1.1.1

This Code provides detailed technical specifications, requirements and recommendations applicable to the transport of dangerous goods in Australia by road and rail. Subject matter includes rules and recommendations covering:

- (a) the definition, classification, packaging, marking and labelling of substances and articles that meet the United Nations classification criteria for dangerous goods or are prescribed as dangerous goods by the competent authority; and
- (b) the consigning of dangerous goods for transport, including loading, stowage, load retention and segregation; and
- (c) the provision of transport documentation describing the dangerous goods being transported, and appropriate emergency information for those goods; and
- (d) the unloading, receipt and transfer of dangerous goods; and
- (e) the transport of dangerous goods; including the use of vehicles, containers and equipment, and the provision of safety equipment.

This Code, in Part 3, Table 3.2.3, incorporates a comprehensive listing of all dangerous goods by UN number and in Section 3.2.4.2 by alphabetic listing of the proper shipping name.

**NOTE:** *While this Code includes technical instructions intended to provide for safe transport by road and rail of dangerous goods in all conditions, its provisions are only legally enforceable where they are adopted, applied or incorporated by legislation applicable in the jurisdiction.*

For road and rail transport throughout Australia, it is expected that each jurisdiction will prepare and implement regulations that adopt or incorporate the provisions of the Model subordinate instrument. The details of the legislation in each jurisdiction can be found on the Commonwealth Department of Infrastructure, Transport, Regional Development, Communications and the Arts website at:

<https://www.infrastructure.gov.au/infrastructure-transport-vehicles/transport-strategy-policy/transport-australia/transport-dangerous-goods>

#### 1.1.1.2

#### Exceptions to application:

This Code does not apply to goods that would otherwise be dangerous goods where there is a statement that a particular substance, article or type of goods is 'not subject to this Code' in:

- (a) Part 2; or
- (b) a special provision in chapter 3.3 that is referenced to the goods from Column (6) of the Dangerous Goods List in Section 3.2.3;

Subject, in each instance, to any and all conditions included with that statement being met.

**NOTE:** The application clauses of the Model subordinate instrument contain a number of exemptions from its application, in the following areas:

1. Regulation 1.1.5 conditionally exempts the non-commercial transport of up to 25 % of a placard load of certain dangerous goods from the application of the Model subordinate instrument and therefore from the mandatory application of this Code;
2. Under Regulation 1.1.6(1), the transport of dangerous goods of Classes 1 and 7 is outside the scope of the Model subordinate instrument, being subject to other legislation. However, in the interests of safety, and where consistent with that legislation;
  - (a) the segregation provisions of Part 9 of this Code should be applied to those classes when they are transported with other dangerous goods; and
  - (b) when transporting goods of those classes that have a subsidiary hazard, the provisions of this Code should be additionally applied;
3. Regulation 1.1.6(2) provides further exemptions for:
  - (a) very small consignments where:
    - (i) the aggregate quantity of dangerous goods is not more than the limits specified in Table 1.1.1.2; and
    - (ii) The consignment does not include dangerous goods with an LQ value of 0 in column 7a of the dangerous goods list;
  - (b) dangerous goods in vehicle fuel tanks;
  - (c) dangerous goods in appliances and plant that form part of a vehicle and are necessary for its operation; and

- (d) portable fire fighting and safety equipment that are part of the vehicle's safety equipment;
4. Regulation 1.1.6(3) provides an exemption from the application of the Model subordinate Instrument and therefore from the mandatory application of this Code, for the transport of dangerous goods by a mobile processing unit for the purpose of manufacturing explosives. This exemption does not extend to any trailer being towed by a mobile processing unit.
5. Regulation 1.1.7 provides concessions for certain small quantities of dangerous goods when used as tools of trade<sup>1</sup>. Detailed conditions apply.

In each instance, refer to the Model subordinate instrument for details.

| Table 1.1.1.2: Quantity Limits for exempted small consignments             |                   |        |       |                     |      |       |           |               |              |            |            |          |

| Packing Group                                                              | Class or Division |        |       |                     |      |       |           |               |              |            |            |          |
|                                                                            | 2.1               | 2.2    | 2.3   | 3                   | 4.1  | 4.3   | 5.1       | 5.2<br>Liquid | 5.2<br>Solid | 6.1        | 8          | 9        |
| I                                                                          | 50 ml             | 100 ml | 50 ml | 20 ml               | 20 g | 20 g  | 20 g (ml) |               |              | 20 g (ml)  | 20 g (ml)  | —        |
| II                                                                         |                   |        |       | 150 ml              | 2 kg | 150 g | 1 kg (L)  |               |              | 500 g (ml) | 500 g (ml) | 2 kg (L) |
| III                                                                        |                   |        |       | 300 ml <sup>a</sup> |      |       |           |               |              |            |            |          |
| Types B or C                                                               |                   |        |       |                     |      |       |           | 25 ml         | 100 g        |            |            |          |
| Types D, E or F                                                            |                   |        |       |                     |      |       |           | 125 ml        | 500 g        |            |            |          |
| Table notes:                                                               |                   |        |       |                     |      |       |           |               |              |            |            |          |
| a. 2 L if the Class 3, packing group III substance is Manufactured Product |                   |        |       |                     |      |       |           |               |              |            |            |          |

### 1.1.1.3 Assignment of duties

Throughout this Code, particular actions are prescribed, but the responsibilities for carrying out these actions are not specifically assigned to any particular person. These responsibilities are assigned by the Regulations.

### 1.1.1.4 Reserved

### 1.1.1.5 Reserved

### 1.1.1.6 Consignment by post

Dangerous Goods must not be consigned by mail except as agreed by the postal authority.

<sup>1</sup>Tools of trade concessions may not have been adopted by some jurisdictions. Refer to the relevant state or territory legislation

### 1.1.1.7 **Commencement of Edition 7.9 of the Australian Code for the Transport of Dangerous Goods by Road & Rail**

The amendments made to this Code, approved by the Transport and Infrastructure Senior Official Committee on 10 April 2024, take effect on 1 October 2024.

However, a person does not commit an offence against, under, or in relation to this Code as amended by that Amendment Package if the person transports dangerous goods by road or rail before 1 October 2025 in accordance with this Code in the form it was in immediately before October 2024.

### 1.1.1.8 **Transport of dangerous goods used as a coolant or conditioner <sup>1</sup>**

Dangerous goods, that are only asphyxiant (which dilute or replace the oxygen normally in the atmosphere), when used in cargo transport units for cooling or conditioning purposes are only subject to the provisions of section 5.5.3.

### 1.1.1.9 **Lamps Containing Dangerous Goods**

The following lamps are not subject to this Code provided that they do not contain radioactive material and do not contain mercury in quantities above those specified in special provision 366 of chapter 3.3:

- (a) Lamps that are collected directly from individuals and households when transported to a collection or recycling facility;
- (b) Lamps each containing not more than 1 g of dangerous goods and packaged so that there is not more than 30 g of dangerous goods per package, provided that:
  - (i) the lamps are certified to a manufacturer's quality management system;  
**NOTE:** *The application of ISO 9001:2008 may be considered acceptable for this purpose. and*
  - (ii) each lamp is either individually packed in inner packagings, separated by dividers, or surrounded with cushioning material to protect the lamps and packed into strong outer packagings meeting the general provisions of 4.1.1.1 and capable of passing a 1.2 m drop test
- (c) Used, damaged or defective lamps each containing not more than 1g of dangerous goods with not more than 30 g of dangerous goods per package when transported from a collection or recycling facility. The lamps shall be packed in strong outer packagings sufficient for preventing release of the contents under normal conditions of transport meeting the general provisions of 4.1.1.1 and that are capable

---

<sup>1</sup> Allows the use of specific dangerous goods (UN 1845, UN 1951 or UN1977) to cool or preserve or 'condition' other dangerous goods or articles for transport. An asphyxiant label (Figure 5.5.2) section 5.5.3.4 is required to be attached to the package.

- of passing a drop test of not less than 1.2 m.
- (d) Lamps containing only gases of Division 2.2 (according to 2.2.2.1) provided they are packaged so that the projectile effects of any rupture of the bulb will be contained within the package.

**NOTE:** Lamps containing radioactive material are addressed in Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) codes:

[www.arpansa.gov.au/Publications/codes/rps.cfm](http://www.arpansa.gov.au/Publications/codes/rps.cfm)

## 1.1.2

### **DANGEROUS GOODS FORBIDDEN FROM TRANSPORT**

#### 1.1.2.1

Dangerous goods forbidden from transport includes any substance or article that meets the definition of goods too dangerous to be transported in 1.2.1 of this Code. Appendix A lists a number of goods which are considered to be goods too dangerous to be transported.

## CHAPTER 1.2: INTERPRETATION, DEFINITIONS, UNITS of MEASUREMENT and REFERENCES

### Introductory Note

**NOTE:** *Scope of definitions*

*This chapter provides definitions of general applicability that are used throughout this Code. Additional definitions of a highly specific nature (e.g., terms relating to construction of intermediate bulk containers or portable tanks) are presented in the relevant chapters.*

### 1.2.0 INTERPRETATION

In this Code, unless the contrary intention appears, a word or expression which is defined in the Regulations, but is not defined in this Code, has the meaning attributed to it in the Regulations. However, a word or expression which is defined differently in section 1.2.1 of this Code to the definition of the same word or expression in the Regulations, has for the purposes of this Code the meaning attributed to it in this Code.

1.2.0.1 For the purpose of compliance with this code the words subsidiary risk have the same meaning as subsidiary hazard.

### 1.2.1 DEFINITIONS

**NOTE:** *Terms that are also defined in the Model subordinate instrument are identified with an asterix (\*).*

**For the purposes of this Code:**

**ANZ-ERG** means the Australian and New Zealand Emergency Response Guide

**Aerosols or aerosol dispensers** means an article consisting of a non-refillable receptacle meeting the requirements of Section 6.2.4, made of metal, glass or plastics and containing a gas, compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.

**Aggregate quantity\*** means the total of:

- (a) the number of kilograms of:
  - (i) solid dangerous goods; and
  - (ii) articles (including aerosols); and
- (b) the number of litres or kilograms, whichever is used in the transport documentation to describe the goods, of liquid dangerous goods; and
- (c) the total capacity in litres of receptacles containing dangerous goods of Class 2 (except aerosols).

*Note: For receptacles that are manifolded together (e.g. MEGCs), the capacity is the internal volume of all spaces connected during transport.*

**Alternative arrangement** means an approval or exemption granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Code (see, for instance, 6.7.5.11.1).

**Animal material** means animal carcasses, animal body parts, food-stuffs or feedstuffs derived from animals.

**Article\*** means a manufactured item, other than a fluid or particle, that:

- (a) is formed into a particular shape or design during manufacture; and
- (b) has hazard properties and a function that are wholly or partly dependent on the shape or design – and includes automotive and marine batteries and other large batteries such as those used in telecommunications facilities, small and other assorted batteries, aerosols, gas-filled lighters, seat belt pre-tensioners and refrigerating machines.

**ASTM** means the American Society for Testing and Materials (ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959, United States of America).

**Bag** means a flexible packaging made of paper, plastics film, textiles, woven material or other suitable materials.

**Box** means a packaging with complete rectangular or polygonal faces, made of metal, wood, plywood, reconstituted wood, fibreboard, plastics or other suitable material. Small holes for purposes such as ease of handling or opening, or to meet classification requirements, are permitted as long as they do not compromise the integrity of the packaging during transport.

**Built-up area** means an area that has one or more roads with street lighting or buildings at intervals of not more than 100 metres for a distance of at least 500 metres.

**Bulk container\*** means a containment system (including any liner or coating) intended for the transport of solid substances which are in direct contact with the containment system. Packagings, intermediate bulk containers (IBCs), large packagings and portable tanks are not included.

A bulk container is:

- of a permanent character and accordingly strong enough to be suitable for repeated use;
- specially designed to facilitate the transport of goods by one or more means of transport without intermediate reloading;
- fitted with devices permitting its ready handling;
- of a capacity of not less than 1.0 m<sup>3</sup>.

Examples of bulk containers are freight containers, offshore bulk containers, skips, bulk bins, swap bodies, trough-shaped containers, roller containers, load compartments of vehicles, flexible bulk containers

**Bundle of cylinders** means a pressure receptacle comprising an assembly of cylinders or cylinder shells that are fastened together and

which are interconnected by a manifold and transported as a unit. The total water capacity must not exceed 3000 litres except that bundles intended for the transport of gases of Division 2.3 must be limited to 1000 litres water capacity.

**NOTE:** *A bundle of cylinders that meets all of the following conditions may be treated as individual cylinders for the purpose of determining capacity*

- (a) *The internal water capacity of each cylinder does not exceed 50L;*
- (b) *None of the cylinders contain gases of Division 2.1 or 2.3; and*
- (c) *The total internal water capacity of all gas cylinders does not exceed 800L.*

**Bus** means a motorised road vehicle:

- (a) built mainly to carry passengers; and
- (b) that seats more than 9 adults (including the driver).

**CANUTEC** means the Canadian Transport Emergency Centre operated by the Transportation of Dangerous Goods (TDG) Directorate of Transport Canada who publish a first responders Emergency Responders Guide

<https://www.tc.gc.ca/eng/canutec/guide-menu-227.htm>

**Capacity\*** means the total internal volume of a packaging at a temperature of 15 degrees Celsius expressed in litres or cubic metres. For receptacles that are manifolded together (e.g. MEGCs), the capacity is the internal volume of all spaces connected during transport.

**Cargo transport unit\*** means

- (a) a road transport tank or freight vehicle; or
- (b) a railway transport tank or freight wagon; or
- (c) a portable tank; or
- (d) a bulk container; or
- (e) a freight container; or
- (f) a MEGC.

**CGA** means the Compressed Gas Association (CGA, 14501 George Carter Way, Suite 103, Chantilly VA 20151, United States of America).

**Class\*** (see 2.0.1).

**Closed cargo transport unit** means

a cargo transport unit which totally encloses the contents by permanent structures with complete and rigid surfaces. Cargo transport units with fabric sides or tops are not considered closed cargo transport units.

**Closed cryogenic receptacle** means a thermally insulated pressure receptacle for refrigerated liquefied gases of a water capacity of not more than 1000 litres.

**Closure** means a device which closes an opening in a receptacle.

**Note:** *For pressure receptacles, closures are, for example, valves, pressure relief devices, pressure gauges or level indicators.*

**Combination packaging** means a combination of packagings for transport purposes, consisting of one or more inner packagings secured in an outer packaging in accordance with 4.1.1.5.

**Combination road vehicle**<sup>1</sup> means a group of road vehicles consisting of:

- (a) a prime mover and 2 or more trailers; or
- (b) a rigid vehicle and 1 or more trailers.

**Combustible liquid** means a combustible liquid within the meaning of AS 1940;

- A C1 combustible liquid is a combustible liquid that has a flash point of 93 °C or less.

**Competent authority**

- (a) in relation to dangerous goods transported by road or rail in a State or Territory, means the Competent Authority appointed for the State or Territory under the Regulations or corresponding legislation; (see page iii) and
- (b) in relation to international transport of dangerous goods or to imported dangerous goods, packagings, portable tanks or bulk containers, means, depending on the context:
  - (i) the Competent Authority for road or rail transport in accordance with (a) above; and
  - (ii) the Competent Authority appointed by the Commonwealth for sea or air transport; and
  - (iii) any body or authority designated or otherwise recognised as such by the government of the country of origin for any purpose in connection with the transport of dangerous goods.

**Composite packagings** are packagings consisting of an outer packaging and an inner receptacle so constructed that the inner receptacle and the outer packaging form an integral packaging. Once assembled it remains thereafter an integrated single unit; it is filled, stored, transported and emptied as such.

**Consignee** means any person, organisation or government which is entitled to take delivery of a consignment.

**Consignment** means any package or packages, or load of dangerous goods, presented by a consignor for transport.

A person **consigns** dangerous goods for transport, and is the **consignor** of the goods, if:

- (a) the person, with the person's authority, is named or otherwise identified in transport documentation that complies with chapter 11.1 of this Code as the consignor of the goods; or
- (b) sub-clause (a) does not apply to the person or anyone else and the person:

---

<sup>1</sup>Examples of combination road vehicles include B-doubles, B-triples, road trains and rigid truck/'dog' or 'pig' trailer combinations. Despite common usage, where used in this Code, a combination road vehicle does not include a semi-trailer comprising a prime mover and a single articulated trailer.

- (i) engages a prime contractor or rail operator, either directly or through an agent or other intermediary, to transport the goods; or
- (ii) if sub-clause (i) does not apply, has possession of, or control over, the goods immediately before the goods are transported; or
- (iii) if neither sub-clause (i) nor (ii) applies, loads a vehicle with the goods, for transport, at a place where dangerous goods are awaiting collection and that is unattended (except by the driver) during loading; or
- (c) sub-clauses (a) and (b) do not apply to the person or anyone else and:
  - (i) the goods are imported into Australia; and
  - (ii) the person is the importer of the goods.

**Crate** means an outer packagings with incomplete surfaces.

**Critical temperature** is the temperature above which the substance cannot exist in the liquid state.

**Cylinder** means a pressure receptacle of a water capacity not exceeding 150 litres.

**Dangerous goods\*** are:

- (a) goods that are determined under Regulation 1.5.1(1)(a) to be dangerous goods, or
- (b) goods that satisfy the criteria set out, or referred to, in Part 2 of this Code for determining whether goods are dangerous goods.

However, substances or articles that satisfy the criteria set out, or referred to, in Part 2 of this Code are not dangerous goods for the purposes of this Code if they are:

- (a) determined under Regulation 1.5.1(1)(a) not to be dangerous goods; or
- (b) described as 'not subject to this Code' in a special provision in chapter 3.3 of this Code that is applied to the goods by column (6) of the Dangerous Goods List, provided that all conditions included with that statement are met.

**Dangerous Goods List\*** (see Introduction to chapter 3.2).

**Dangerous goods packed in limited quantities** means goods packed in accordance with chapter 3.4 of this Code.

**Dangerous situation\*** means a situation that is causing or is likely to cause imminent risk of death or injury to a person, or harm to the environment or to property.

**Degree of filling** means the ratio, expressed in %, of the volume of liquid or solid introduced at 15°C into the means of containment and the volume of the means of containment ready for use.

**Demountable tank** means a tank, other than a portable tank, that is designed to be carried on a vehicle but that does not form part of and is not permanently attached to the vehicle and is designed to be removable.

**Design life**, for composite cylinders and tubes, means the maximum life (in number of years) to which the cylinder or tube is designed and approved in accordance with the applicable standard.

**Division\*** (see 2.0.1).

**Domestic consumable dangerous good** means party poppers; sparklers and bon-bons (UN0337), domestic smoke detectors (UN 2911), lighters and lighter refills (UN1057) or portable fire extinguishers with compressed or liquefied gas up to 23kg gross weight) (UN 1044).

**Drum** means a flat-ended or convex-ended cylindrical packaging made of metal, fibreboard, plastics, plywood or other suitable materials. This definition also includes packagings of other shapes e.g. round taper-necked packagings, or pail-shaped packagings. Wooden barrels or jerrycans are not covered by this definition.

**EAC** means the Emergency Action Code, also known as Hazchem Code, assigned by the NCEC, in co-operation with the UK Home Office, that indicates to emergency services the actions to be taken in the event of an incident. (see also Hazchem Code)

**Elevated temperature substance** means a substance which is transported or offered for transport:

- in the liquid state at a temperature at or above 100 °C;
- in the liquid state with a flash point above 60 °C and which is intentionally heated to a temperature above its flash point; or
- in a solid state and at a temperature at or above 240 °C.

**Emergency service** means:

- (a) an ambulance, fire, police or other emergency service; or
- (b) a unit of the Defence Force corresponding to a service mentioned in paragraph (a).

**Filling ratio** means the ratio of the mass of gas to the mass of water at 15 °C that would fill completely a pressure receptacle fitted ready for use.

**Fire-risk substance** means any readily ignitable solid substance, including:

- (a) waste paper; and
- (b) hay; and
- (c) sawdust; and
- (d) wood chips.

**Food\*** includes:

- (a) a substance prepared or intended for human or animal consumption; and
- (b) a substance (except dangerous goods) intended to be an ingredient of food.

**Food packaging\*** means:

- (a) a receptacle that contains or is designed or intended to contain food; or

- (b) material designed or intended to be used in a receptacle that is designed or intended to contain food; or
- (c) plastics wrapping intended for the packaging of food.

**Free from dangerous goods** means, in relation to a receptacle, that:

- (a) the receptacle is:
  - (i) thoroughly cleaned so that there is no discernible trace of the dangerous goods; or
  - (ii) subjected to a process in which its contents are neutralised, cured or chemically deactivated; and
- (b) the atmosphere within the receptacle is cleared:
  - (i) if the gas or vapour in the atmosphere is listed in “Adopted National Exposure Standards for Atmospheric Contaminants in the Occupational Environment”, to ensure that the concentration is less than the TWA Exposure Standard listed for that gas or vapour; and
  - (ii) if the atmosphere includes dangerous goods of Division 2.1 or vapour from dangerous goods of Class 3 or Subsidiary Hazard 3, to ensure that the concentration of those gases and vapours is less than 5% of the lower explosive limit for the goods when sampled at ambient temperature.

**Freight container\*** means an article of transport equipment that is:

- (a) of a permanent character and accordingly strong enough to be suitable for repeated use;
- (b) specially designed to facilitate the transport of goods, by one or other modes of transport, without intermediate reloading;
- (c) fitted with devices permitting its ready stowage and handling, particularly its transfer from one mode of transport to another;
- (d) so designed as to be easy to fill and empty;
- (e) having an internal volume of not less than 1 m<sup>3</sup>, except for containers for the carriage of radioactive material

In addition:

Small freight container means a freight container that has an internal volume of not more than 3 m<sup>3</sup>.

Large freight container means:

- (a) a freight container that does not meet the definition of a small freight container;
- (b) in the meaning of CSC, a container of a size that the area enclosed by the four outer bottom corners is either
  - (i) at least 14 m<sup>2</sup>;
  - (ii) or at least 7 m<sup>2</sup> if fitted with top corner fittings.

*Note: the term 'freight container does not cover conventional packagings, IBCs or vehicles. However a freight container that is carried on a chassis is included. For freight containers for the transport of radioactive material, a freight container may be used as a packaging.*

**Fuel cell** means an electrochemical device that converts the chemical energy of a fuel to electrical energy, heat and reaction products.

**Fuel cell engine** means a device used to power equipment and which consists of a fuel cell and its fuel supply, whether integrated with or separate from the fuel cell, and includes all appurtenances necessary to fulfil its function.

**GHS** means the tenth revised edition of the Globally Harmonized System of Classification and Labelling of Chemicals, published by the United Nations as document ST/SG/AC.10/30/Rev.10. (Other regulations may use a different edition of the GHS)

**Goods too dangerous to be transported** means:

- (a) goods set out or described in Appendix A of this Code; or
- (b) goods determined under Regulation 1.5.1(2)(a) to be too dangerous to be transported; or
- (c) goods or combinations of goods for which the statement 'are not to be accepted for transport' applies in a special provision in chapter 3.3 of this Code that is applied to the goods by column (6) of the Dangerous Goods List; or
- (d) other goods that are so sensitive or unstable that they cannot be safely transported even if all relevant requirements of the Regulations and this Code are complied with (see 2.1.3.3.2).

**Hazchem code**, in relation to dangerous goods in placardable units, tanks or bulk containers, means the Hazchem code prescribed for those goods in Appendix C. (see also EAC)

**Hose assembly\*** means a hose or hoses connected together, for use in the transfer of dangerous goods to or from a tank on a vehicle, portable tank or storage receptacle and includes:

- (a) if there are 2 or more hoses connected together - the couplings or connections between the hoses; and
- (b) the coupling or attachment connecting the hose or hoses to the tank; and
- (c) anything else (except the vehicle, portable tank or storage receptacle) attached to the hose or hoses.

**IAEA** means the International Atomic Energy Agency (IAEA, P.O. Box 100 – A -1400 Vienna, Austria).

**IAEA Regulations for the Safe Transport of Radioactive Material** means one of the editions of those Regulations, as follows:

- (a) For the 1985, 1985 (as amended 1990) editions: IAEA Safety Series No. 6
- (b) For the 1996 edition: IAEA Safety Series No. ST-1
- (c) For the 1996 (revised) edition: IAEA Safety Series No. TS-R-1 (ST-1, Revised)
- (d) For the 1996 (as amended 2003), 2005, 2009 editions: IAEA Safety Standards Series No. TS-R-1
- (e) For the 2012 edition: IAEA Safety Standards Series No. SSR-6
- (f) For the 2018 edition: IAEA Safety Standards Series No. SSR-6 (Rev.1)

**ICAO** means the International Civil Aviation Organisation (ICAO, 999 University Street, Montreal, Quebec H3C 5H7, Canada).

**IMO** means the International Maritime Organisation (IMO, 4 Albert Embankment, London SE1 7SR, United Kingdom).

**Incompatible\*** means:

- (a) Dangerous or other goods are **incompatible** with dangerous goods if:
  - (i) the goods are determined under Regulation 1.5.1(1)(e) to be incompatible with the dangerous goods; or
  - (ii) when the goods are mixed, or otherwise brought into contact, with the dangerous goods, the goods are likely to interact with the dangerous goods and increase risk because of the interaction.
- (b) A containment system, (including a packaging, tank, bulk container, IBC or MEGC) or equipment for use in the transport or transfer of dangerous goods is **incompatible** with the goods if any component of the system or equipment that is intended or likely to come into contact with the substance during handling, transfer or transport is:
  - (i) likely to interact with the goods and increase risk because of the interaction; and
  - (ii) not protected from contact under foreseeable circumstances by a protective coating or other effective means.

**Inner packaging\*** means a packaging for which an outer packaging is required for transport.

**Inner receptacle\*** means a receptacle which require an outer packaging in order to perform their containment function.

**Inner vessel** for a closed cryogenic receptacle, means the pressure vessel intended to contain refrigerated liquefied gas.

**Inspection body** means an independent inspection and testing body approved by or acceptable to the competent authority responsible for pressure vessel legislation.

**Intermediate Bulk Container\* (IBC)** means any rigid or flexible portable packagings, other than those specified in chapter 6.1, that:

- (a) has a capacity of:
  - (i) not more than 3.0 m<sup>3</sup> (3,000 litres) for solids and liquids of packing groups II and III;
  - (ii) not more than 1.5 m<sup>3</sup> for solids of packing group I when packed in flexible, rigid plastics, composite, fibreboard and wooden IBCs;
  - (iii) not more than 3.0 m<sup>3</sup> for solids of packing group I when packed in metal IBCs;
  - (iv) not more than 3.0 m<sup>3</sup> for radioactive material of Class 7;
- (b) is designed for mechanical handling;
- (c) is resistant to the stresses produced in handling and transport, as determined by tests.

**Remanufactured IBC** means a metal, rigid plastics or composite IBCs that:

- (a) is produced as a UN type from a non-UN type; or
- (b) is converted from one UN design type to another UN design type.

**Remanufactured IBCs** are subject to the same requirements of this Code that apply to new IBCs of the same type (see also design type definition in 6.5.6.1.1).

**Repaired IBC** means a metal, rigid plastics or composite IBC that, as a result of impact or for any other cause (e.g. corrosion, embrittlement or other evidence of reduced strength as compared to the design type) is restored so as to conform to the design type and to be able to withstand the design type tests. For the purposes of this Code, the replacement of the rigid inner receptacle of a composite IBC with a receptacle conforming to the original design type from the same manufacturer is considered repair. However, routine maintenance of rigid IBCs (see definition below) is not considered repair. The bodies of rigid plastics IBCs and the inner receptacles of composite IBCs are not repairable. Flexible IBCs are not repairable unless in accordance with a competent authority determination.

**Routine maintenance of flexible IBCs** means the routine performance on plastics or textile flexible IBCs of operations, such as:

- (a) cleaning; or
- (b) replacement of non-integral components, such as non-integral liners and closure ties, with components conforming to the original manufacturer's specification;

provided that these operations do not adversely affect the containment function of the flexible IBC or alter the design type.

**Routine maintenance of rigid IBC** means the routine performance on metal, rigid plastics or composite IBCs of operations such as:

- (a) cleaning
- (b) removal and reinstallation or replacement of body closures (including associated gaskets), or of service equipment, conforming to the original manufacturer's specifications, provided that the leak-tightness of the IBC is verified; or
- (c) restoration of structural equipment not directly performing a dangerous goods containment or discharge pressure retention function so as to conform to the design type (e.g. the straightening of legs or lifting attachments) provided that the containment function of the IBC is not affected.

**Intermediate packaging** means a packaging placed between inner packagings, or articles, and an outer packaging.

**Jerrican** means a metal or plastics packaging of rectangular or polygonal cross-section.

**Journey** means the transport of dangerous goods from where the goods are consigned to where the goods are delivered to the consignee.

**Label** means:

- (a) a label as illustrated in 5.2.2.2.2, identifying the class or division, or a subsidiary hazard of a dangerous substance or article; or
- (b) a mixed class label as illustrated in 5.2.2.2.3
- (c) a limited quantities label as illustrated in 5.2.2.2.4 and 3.4.4.

**Large packaging**<sup>1</sup> means a packaging consisting of an outer packaging which contains articles or inner packagings and which

- (a) is designed for mechanical handling; and
- (b) exceeds 400 kg net mass or 450 litres capacity but has a volume of not more than 3 m<sup>3</sup>;

**Large salvage packaging** means a special packaging which:

- (a) is designed for mechanical handling; and
- (b) exceeds 400 kg net mass or 450 litres capacity but has a volume of not more than 3 m<sup>3</sup>;

into which damaged, defective, leaking or non-conforming dangerous goods packages, or dangerous goods that have spilled or leaked are placed for purposes of transport for recovery or disposal.

**Limited Quantity** (see Dangerous goods packed in limited quantities).

**Liner** means a separate tube or bag inserted into a packaging, (including IBCs and large packagings) but not forming an integral part of it, including the closures of its openings.

**Liquid** means a dangerous goods which at 50 °C have a vapour pressure of not more than 300 kPa (3 bar), which is not completely gaseous at 20 °C and at a pressure of 101.3 kPa, and which has a melting point or initial melting point of 20 °C or less at a pressure of 101.3 kPa. A viscous substance for which a specific melting point cannot be determined must be subjected to the ASTM D 4359-90 test; or to the test for determining fluidity (penetrometer test) prescribed in section 2.3.4 of annex A of the Agreement concerning the International Carriage of Dangerous Goods by Road (ADR)<sup>2</sup>.

**Load\*** means, in relation to a cargo transport unit, all the goods in or on that cargo transport unit.

**Load platform** means, in relation to a rail wagon:

- (a) in the case of a rigid rail wagon (e.g. container flat, 'skel', well, tank or open wagon, or rail van), the whole of that wagon; or
- (b) in the case of an articulated wagon, each rigid section of the wagon that is designed to transport goods in one or more cargo transport units.

**Manufactured product** means dangerous goods of Class 3 of packing group II or packing group III:

- (a) that is a suspension or solution of at least 10% non-volatile materials as determined by AS 1580, Method 301.1;
- (b) of which less than 3% of the mobile solvent layer separates in the solvent separation test specified in the Manual of Tests and Criteria; and

---

<sup>1</sup>Large packaging does not include an IBC and is a different concept to an overpack.

<sup>2</sup>United Nations publication: ECE/TRANS/326 (Sales No. E.22.VIII.2).

- (c) the viscosity of which is:
- (i) at least 250 mm<sup>2</sup>/s (centistokes) at 23 °C; or
  - (ii) at least 20 mm<sup>2</sup>/s at 23 °C if the product requires stirring before use.

**Manual of Tests and Criteria** means the eighth revised edition of the United Nations publication bearing this title (ST/SG/AC.10/11/Rev.8).

**Marking** includes all information, other than a label or a placard, that is required by this Code to be applied or affixed to a packaging, a package, an overpack, a large package, an intermediate bulk container, a portable tank, a demountable tank, a multiple element gas container a road tank vehicle or a rail tank wagon.

**Maximum capacity** as used in 6.1.4 means the maximum inner volume of receptacles or packagings expressed in litres.

**Maximum net mass** means the maximum net mass of contents in a single packaging or maximum combined mass of inner packagings and the contents thereof and is expressed in kg.

**Metal hydride storage system** means a single complete hydrogen storage system, including a pressure receptacle shell, metal hydride, pressure relief device, shut-off valve, service equipment and internal components used for the transport of hydrogen only.

**Modal codes** means the IMDG Code for sea transport and the ICAO Rules or IATA Regulations for air transport (see 1.2.3.1).

**Model Law** means the Model subordinate instrument or the Model Transport of Dangerous Goods by Road or Rail Act as agreed to from time to time by the Transport and Infrastructure Council and published on the Parliamentary Counsel's Committee website.

**Model subordinate instrument** means the Model subordinate instrument on the Transport of Dangerous Goods by Road or Rail as agreed to from time to time by the Transport and Infrastructure Council and published on the Parliamentary Counsel's Committee website.

(see also "Regulations").

**Multimodal** means applicable to, or suitable for use on, more than one mode of transport (e.g. road and rail transport or road and sea transport).

**Multiple-element gas containers (MEGCs)** means a multimodal assembly of cylinders, tubes or bundles of cylinders which are interconnected by a manifold and assembled within a framework. The MEGC includes service and structural equipment necessary for the transport of gases.

**Must**, where used in a numbered clause or special provision, or in a table in this Code, indicates a mandatory requirement.

**Net Explosive Mass (NEM)** means the total mass of the explosive substances, without the packagings, casings, etc. (Net explosive quantity (NEQ), net explosive contents (NEC), or net explosive weight (NEW) are often used to convey the same meaning.).

**N.O.S.** means Not Otherwise Specified.

**Nominally empty** means the previously contained dangerous goods has been removed but the receptacle has not been cleaned *free of dangerous goods* to ensure no dangerous goods residue or hazardous vapours remain

**Not subject to this Code**, when included in a special provision in chapter 3.3 of this Code that is applied to the goods by column (6) of the Dangerous Goods List, means the goods are not dangerous goods for the purposes of this Code, provided that all conditions included with that statement are met.

**Open cryogenic receptacle** means a transportable thermally insulated receptacle for refrigerated liquefied gases maintained at atmospheric pressure by continuous venting of the refrigerated liquefied gas.

**Outer packaging\*** means the outer protection of a composite or combination packaging together with any absorbent materials, cushioning and any other components necessary to contain and protect inner receptacles or inner packagings.

**Overpack\*** means an enclosure used to contain one or more packages and to form one unit for convenience of handling and stowage during transport. Examples of overpacks are a number of packages either:

- (a) placed or stacked on to a load board such as a pallet and secured by strapping, shrink wrapping, stretch wrapping, or other suitable means; or
- (b) placed in a protective outer packaging such as a box or crate.

**Owner\*** (see vehicle owner).

**Package\*** means the complete product of the packing operation, consisting of the packaging and its contents prepared for transport.

**Packaging\*** means one or more receptacles and any other components or materials necessary for the receptacles to perform their containment and other safety functions.

**Packing group\*** (see 2.0.1).

**Placard\*** means a label or Emergency Information Panel that is fixed to, stenciled or printed on, or placed in a frame that is fixed to a cargo transport unit or placardable unit.

**Placard load\*** means a load in a cargo transport unit that must be placarded under chapter 5.3 as determined in accordance with Table 5.3.

**Placardable unit** means any receptacle such as an IBC, pressure drum, tube, MEGC or portable tank, that individually has a capacity of more than 500 kg(L).

*Note: the definition of receptacle does not include articles*

**Portable tank** means:

- (a) For the purposes of the transport of substances of Class 1 and Classes 3 to 9, a multimodal portable tank. It includes a shell fitted with service equipment and structural equipment necessary for the transport of dangerous substances;

- (b) For the purposes of transport of non-refrigerated, liquefied gases of Class 2, a multimodal tank having a capacity of more than 450 litres. It includes a shell fitted with service equipment and structural equipment necessary for the transport of gases;
- (c) For the purposes of transport of refrigerated liquefied gases, a thermally insulated tank having a capacity of more than 450 litres fitted with service equipment and structural equipment necessary for the transport of refrigerated liquefied gases;

The portable tank must be capable of being loaded and discharged without the need of removal of its structural equipment. It must possess stabilizing members external to the shell, and must be capable of being lifted when full. It must be designed primarily to be loaded on to a vehicle or vessel and is equipped with skids, mountings or accessories to facilitate mechanical handling. Road tank-vehicles, rail tank-wagons, non-metallic tanks (except FRP portable tanks, see chapter 6.9), gas cylinders, large receptacles, and intermediate bulk containers (IBCs) are not considered to be portable tanks.

**Portable fire extinguisher** means a first attack firefighting appliance which is designed to be carried by hand and which, when charged to design capacity, has a gross mass not greater than 23kg.

**Pressure drum** means a welded pressure receptacle of a water capacity exceeding 150 litres and of not more than 1000 litres, (e.g. cylindrical receptacles equipped with rolling hoops, spheres on skids).

**Pressure receptacle** means a transportable receptacle intended for holding substances under pressure including its closure(s) and other service equipment and is a collective term that includes cylinders, tubes, pressure drums, closed cryogenic receptacles, metal hydride storage systems, bundles of cylinders and salvage pressure receptacles.

**Pressure receptacle shell** means a cylinder, a tube, a pressure drum or a salvage pressure receptacle without its closures or other service equipment, but including any permanently attached device(s) (e.g. neck ring, foot ring, etc.)

**Note:** *The terms 'cylinder shell', 'pressure drum shell' and 'tube shell' are also used.*

**Prime contractor\*** for the transport of dangerous or other goods by road means the person who, in conducting a business for or involving the transport of dangerous goods by road, undertakes to be responsible, or is responsible, for the transport of the goods by road.

**Prime mover** means a road vehicle that is designed to tow a trailer, but does not include a vehicle that has a load carrying capability in addition to a trailer.

**Proper shipping name** has the meaning given to it in clause 2.0.2 of this Code.

**Quality assurance** means a systematic programme of controls and inspections applied by any organisation or body which is aimed at provid-

ing adequate confidence that the standard of safety prescribed in this Code is achieved in practice.

**Rail operator** for the transport of dangerous or other goods by rail, means a person who undertakes to be responsible, or is responsible, for:

- (a) the transport of the goods by rail; or
- (b) the condition of a rail wagon transporting the goods.

**Rail tank wagon** means a rail wagon of which a tank forms an integral part.

**Rail wagon** means a unit of rolling stock that:

- (a) is designed to carry freight by rail; and
- (b) bears a unique identifying number or alphanumeric identifier.

**React dangerously** means, in relation to the reaction of substances, to react in a manner that directly creates a hazard due to the reaction:

- (a) being violent; or
- (b) producing an explosion; or
- (c) producing a potentially explosive combination of products; or
- (d) producing potentially dangerous quantities of toxic vapour or gas.

**Receptacle** means a containment vessel for receiving and holding substances or articles, including any means of closing.

**Reconditioned packagings** include:

- (a) metal drums that:
  - (i) are cleaned to original materials of construction, with all former contents, internal and external corrosion, and external coatings and labels removed;
  - (ii) are restored to original shape and contour, with chimes (if any) straightened and sealed, and all non-integral gaskets replaced; and
  - (iii) are inspected after cleaning but before painting, with rejection of packagings with visible pitting, significant reduction in material thickness, metal fatigue, damage threads or closures, or other significant defects; or
- (b) plastics drums and jerricans that:
  - (i) are cleaned to original materials of construction, with all former contents, external coatings and labels removed;
  - (ii) have all non-integral gaskets replaced; and
  - (iii) are inspected after cleaning with rejection of packagings with visible damage such as tears, creases or cracks, or damaged threads, or closures, or other significant defects.

**Recycled plastics material** means material recovered from used industrial packagings or from other plastics material that has been pre-sorted and prepared for processing into new packagings, including IBCs. The specific properties of the recycled material used for production of new packagings, including IBCs, must be assured and documented regularly as part of a quality assurance programme recognised by the competent authority. The quality assurance programme must include a record of proper pre-sorting and verification that each batch of recycled plastics

material, which is of homogeneous composition, is consistent with the material specifications (melt flow rate, density, and tensile properties) of the design type manufactured from such recycled material. This necessarily includes knowledge about the plastics material from which the recycled plastics have been derived, as well as awareness of the prior contents of those packagings if those prior contents might reduce the capability of new packagings produced using that material. In addition, the packaging or IBC manufacturer's quality assurance programme under 6.1.1.4 or 6.5.4.1 must include performance of the mechanical design type test in 6.1.5 or 6.5.6 on packagings or IBCs, manufactured from each batch of recycled plastics material. In this testing, stacking performance may be verified by appropriate dynamic compression testing rather than static load testing.

**NOTE:** AS ISO 16103 “Packaging – Transport packages for dangerous goods - Recycled plastics material”, provides additional guidance on procedures which may be followed in approving the use of recycled plastics material. These guidelines have been developed based on the experience of the manufacturing of drums and jerricans from recycled plastics material and as such may need to be adapted for other types of packagings, IBCs and large packagings made of recycled plastics material.

**Regulations** means the Model Law and the Model Subordinate Instrument.

Reference in this Code to a **numbered Regulation** (e.g. Regulation 1.1.7) is a reference to the clause bearing that number in the Model subordinate instrument. Depending on the context, **Regulations** may also mean the law of the participating jurisdiction that adopts or embodies the Model Legislation.

**Remanufactured IBCs** (see “Intermediate Bulk Container (IBC)”).

**Remanufactured large packaging** means a metal or rigid plastics large packaging that:

- (a) is produced as a UN type from a non-UN type; or
- (b) is converted from one UN design type to another UN design type.

Remanufactured large packagings are subject to the same requirements of this Code that apply to new large packagings of the same type (see also design type definition in 6.6.5.1.2).

**Remanufactured packagings** include:

- (a) metal drums that:
  - (i) are produced as a UN type from a non-UN type;
  - (ii) are converted from one UN type to another UN type; or
  - (iii) undergo the replacement of integral structural components (such as non-removable heads); or
- (b) plastics drums that:
  - (i) are converted from one UN type to another UN type (e.g. 1H1 to 1H2); or
  - (ii) undergo the replacement of integral structural components.

**NOTE:** Remanufactured drums are subject to the same requirements of this Code that apply to a new drum of the same type.

**Repaired IBCs** (see “Intermediate Bulk Containers (IBCs)”).

**Reused large packaging** means a large packaging to be refilled which has been examined and found free of defects affecting the ability to withstand the performance tests: the term includes those which are refilled with the same or similar compatible contents and are transported within distribution chains controlled by the consignor of the product.

**Reused packaging** means a packaging to be refilled which have been examined and found free of defects affecting the ability to withstand the performance tests: the term includes those which are refilled with the same or similar compatible contents and are transported within distribution chains controlled by the consignor of the product.

**Rigid vehicle** means a vehicle the load carrying area of which is fixed to the vehicle’s chassis or frame.

**Road tank vehicle** means a road vehicle of which a tank forms part or to which a tank, other than a portable tank, is attached.

**Rolling stock** means a vehicle that operates on or uses a railway track, but does not include a vehicle designed for use both on and off a railway track when the unit is operated off the railway track.

**Routine maintenance of flexible IBC** (see “Intermediate Bulk Containers (IBC)”).

**Routine maintenance of rigid IBC** (see “Intermediate Bulk Container (IBC)”).

**SADT** (see self-accelerating decomposition temperature).

**Safety Data Sheet** means Safety Data Sheet (SDS) or the material Safety Data Sheet [MSDS] for the dangerous goods or other substance, prepared by the manufacturer or Australian supplier in accordance with the Model Code of Practice: Preparation of safety data sheets for hazardous chemicals published by Safework Australia, or equivalent.

**Salvage packaging** means a special packaging into which damaged, defective, leaking or non-conforming dangerous goods packages, or dangerous goods that have spilled or leaked, are placed for purposes of transport for recovery or disposal.

**Salvage pressure receptacle** means a pressure receptacle with a water capacity not exceeding 3,000 litres into which are placed damaged, defective, leaking or non-conforming pressure receptacle(s) for the purpose of transport e.g. for recovery or disposal.

**SCBA** means a self-contained breathing apparatus complying with AS/NZS 1715.

**Segregation device** means a device for segregating dangerous goods from incompatible goods, that:

- (a) complies with the requirements in relation to devices used to segregate those goods set out in chapter 6.11; or

- (b) is approved by a Competent Authority as a segregation device for use in segregating the goods.

**Self-accelerating decomposition temperature (SADT)** means the lowest temperature at which self-accelerating decomposition may occur in a substance in the packaging, IBC or portable tank as offered for transport. The SADT must be determined in accordance with the test procedures given in part II, section 28 of the Manual of Tests and Criteria.

**Self-accelerating polymerization temperature (SAPT)** means the lowest temperature at which self-accelerating polymerization may occur with a substance in the packaging, IBC, portable tank as offered for transport. The SAPT must be determined in accordance with the test procedures established for the self-accelerating decomposition temperature for self-reactive substances in accordance with part II, section 28 of the Manual of Tests and Criteria.

**Semi-trailer** means a trailer having:

- (a) one axle group, or a single axle, towards the rear of the trailer; and
- (b) a means of attachment to a prime mover that, once attached, results in some of the load being imposed on the prime mover.

**Service equipment\*** of a pressure receptacle means closure(s), manifold(s), piping, porous, absorbent or adsorbent material and any structural devices, e.g. for handling.

**Service life**, for composite cylinders and tubes, means the number of years the cylinder or tube is permitted to be in service.

**Settled pressure** means the pressure of the contents of a pressure receptacle in thermal and diffusive equilibrium.

**Shell** means, in relation to a tank, the part of the tank which retains the substance intended for transport (tank proper, receptacle or principal containment vessel), including openings and their closures, but does not include service equipment or external structural equipment.

**Shipment** means the specific movement of a consignment from origin to destination.

**Should** indicates an advisory guideline or recommendation, compliance with which is not mandatory.

**Siftproof packaging** means a packaging impermeable to dry contents including fine solid material produced during transport.

**Single packagings** mean packagings that do not require inner packagings to be capable of performing their containment function during transport including composite packagings.

**Solid** means a dangerous good, other than a gas, that does not meet the definition of liquid in this section.

**Source of ignition** means a source of energy sufficient to ignite a flammable atmosphere including:

- (a) a lighted match, a cigarette lighter, a lighted cigarette or other form of lighted tobacco, a lighted furnace, an incinerator, and any other naked flame; and

- (b) electrical equipment that is not suitable for use in an area defined as a hazardous area in AS/NZS 60079.10.1.

**SP** (Special Provision) means a Special Provision set out in chapter 3.3 of this Code.

**Subsidiary Hazard\*** means a dangerous good that is

- (a) assigned a Subsidiary Hazard by a determination under Regulation 1.5.1(1)(c); or
- (b) satisfies the criteria in Part 2 of this Code for assignment to more than one Class or Division.

**NOTE:** *In 2018 the Code Edition 7.6 replaced subsidiary risk with subsidiary hazard in all instances occurring to align with UN20. For the purposes of compliance with this Code the words subsidiary risk have the same meaning as subsidiary hazard.*

**Subsidiary Risk** means Subsidiary Hazard.

**Tank\*** means a portable tank, including a road tank-vehicle, a rail tank-wagon or a receptacle to contain solids, liquids, or gases, having a capacity of not less than 450 litres when used for the transport of gases as defined in 2.2.1.1.

**Tank vehicle\*** means a road vehicle or rail wagon:

- (a) of which a tank forms part; or
- (b) to which a tank (other than a portable tank) is attached.

However, a tank vehicle does not include a hopper vehicle or any other vehicle into which solid dangerous goods are directly loaded, which should instead be considered a bulk container.

**Technical name** means a technical name as described in 3.1.2.8.

**Telephone advisory service**, for the transport of dangerous goods, means a service providing access by telephone to persons competent to give advice about:

- (a) the construction and properties of the receptacles in which the dangerous goods are being transported; and
- (b) the use of equipment on vehicles on which the dangerous goods are being transported; and
- (c) the properties of the dangerous goods; and
- (d) methods of safely handling the dangerous goods; and
- (e) methods of safely containing and controlling the dangerous goods in a dangerous situation.

**Test pressure** means the required pressure applied during a pressure test for qualification or requalification.

**This Code** means this Australian Code for the Transport of Dangerous Goods by Road & Rail (ADG Code or ADGC or Australian Dangerous Goods Code) and includes any code, manual, supplement or standard applied or adopted by, or incorporated into this Code.

**Trailer\*** means a vehicle that is designed to be towed, or is towed, by another road vehicle but does not include a road vehicle propelled by a motor that forms part of the vehicle.

**Train\*** means two or more units of rolling stock coupled together, at least one unit of which is a locomotive or a self-propelled unit.

**Train manifest** means a list of rolling stock that makes up the train which provides information regarding dangerous goods carried as required by clause 11.1.4.

**Transfer operation** means the process of transferring dangerous goods into or from a tank vehicle, portable tank, bulk container or freight container and includes:

- (a) the connection of any hose or other equipment to the tank vehicle, portable tank, bulk container or freight container; and
- (b) the connection of any hose or other equipment to a storage receptacle; and
- (c) the movement of the goods into or from the tank vehicle, portable tank, bulk container or freight container; and
- (d) any other activity directly connected with the transfer of the goods.

**Transport documentation\*** means documentation that complies with the requirements for transport documents in Part 11 of this Code.

**Tube\*** means a pressure receptacle of seamless or composite construction having a water capacity exceeding 150 litres but not more than 3000 litres.

**UNECE** means the United Nations Economic Commission for Europe (UNECE, Palais des Nations, 8-14 avenue de la Paix, CH-1211 Geneva 10, Switzerland).

**Ullage** means the space above the liquid level in a receptacle.

**Vehicle** means:

- (a) a road vehicle including an articulated or combination vehicle; or
- (b) a unit of rolling stock.

**Vehicle owner** means a person who:

- (a) is the sole owner, a joint owner or a part owner of the vehicle; or
- (b) has possession or use of the vehicle under a credit, hire-purchase, lease or other agreement, except an agreement requiring the vehicle to be registered in the name of someone else.

**Wooden barrel** means a packaging made of natural wood, of round cross-section, having convex walls, consisting of staves and heads and fitted with hoops.

**Working pressure:**

- (a) for a compressed gas, means the settled pressure at a reference temperature of 15 °C in a full pressure receptacle;
- (b) for UN 1001 acetylene, dissolved, means the calculated settled pressure at a uniform reference temperature of 15 °C in an acetylene cylinder containing the specified solvent content and the maximum acetylene content;
- (c) for UN 3374 acetylene, solvent free, means the working pressure which is calculated for the equivalent cylinder for UN 1001 acetylene, dissolved.

1.2.1.3

Clarifying examples for certain defined terms

The following explanations and examples are meant to assist in clarifying the use of some of the packaging terms defined in this section. The definitions in this section are consistent with the use of the defined terms throughout this Code. However, some of the defined terms are commonly used in other ways. This is particularly evident in respect of the term “inner receptacle” which has often been used to describe the “inners” of a combination packaging.

The “inners” of “combination packagings” are always termed “inner packagings” not “inner receptacles”. A glass bottle is an example of such an “inner packaging”.

The “inners” of “composite packagings” are normally termed “inner receptacles”. For example, the “inner” of a 6HA1 composite packaging (plastics material) is such an “inner receptacle” since it is normally not designed to perform a containment function without its “outer packaging” and is not therefore an “inner packaging”.

1.2.2

UNITS OF MEASUREMENT

1.2.2.1

The following units of measurement <sup>a</sup> are applicable in this Code:

Table 1.2.2.1: Dangerous Goods Code Units of Measurement

| Measurement of            | SI Unit <sup>b</sup>          | Acceptable alternative unit   | Relationship between units                 |
|---------------------------|-------------------------------|-------------------------------|--------------------------------------------|
| Length                    | m (metre)                     | —                             | —                                          |
| Area                      | m <sup>2</sup> (square metre) | —                             | —                                          |
| Volume                    | m <sup>3</sup> (cubic metre)  | l (or L) (litre) <sup>c</sup> | 1 L = 10 <sup>-3</sup> m <sup>3</sup>      |
| Time                      | s (second)                    | min (minute)                  | 1 min = 60 s                               |
|                           |                               | h (hour)                      | 1 h = 3600 s                               |
|                           |                               | d (day)                       | 1 d = 86,400 s                             |
| Mass                      | kg (kilo-gram)                | g (gram)                      | 1 g = 10 <sup>-3</sup> kg                  |
|                           |                               | t (tonne)                     | 1 t = 10 <sup>3</sup> kg                   |
| Mass density              | kg/m <sup>3</sup>             | kg/L                          | 1 kg/L = 10 <sup>3</sup> kg/m <sup>3</sup> |
| Temperature               | K (kelvin)                    | °C (degree Celsius)           | 0°C = 273.15 K                             |
| Difference of temperature | K (kelvin)                    | °C (degree Celsius)           | 1°C = 1 K                                  |
| Force                     | N (newton)                    | —                             | 1 N = 1 kg × m/s <sup>2</sup>              |
| Pressure                  | Pa (pascal)                   | bar (bar)                     | 1 bar = 10 <sup>5</sup> Pa                 |
|                           |                               |                               | 1 Pa = 1 N/m <sup>2</sup>                  |

| Measurement of        | SI Unit <sup>b</sup> | Acceptable alternative unit | Relationship between units                                  |
|-----------------------|----------------------|-----------------------------|-------------------------------------------------------------|
| Stress                | N/m <sup>2</sup>     | N/mm <sup>2</sup>           | 1 N/mm <sup>2</sup> = 1 MPa                                 |
| Work                  | J (joule)            | KWh (kilowatt hour)         | 1 kWh = 3.6 MJ                                              |
| Energy                | J (joule)            | –                           | 1 J = 1 N × m = 1 W × s                                     |
| Quantity of heat      | J (joule)            | eV (electronvolt)           | 1 eV = 0.1602 × 10 <sup>-18</sup> J                         |
| Power                 | W (watt)             | –                           | 1 W = 1 J/s = 1 N × m/s                                     |
| Electrical resistance | Ω (ohm)              | –                           | 1 Ω = 1 kg × m <sup>2</sup> s <sup>-3</sup> A <sup>-2</sup> |
| Kinematic viscosity   | m <sup>2</sup> /s    | mm <sup>2</sup> /s          | 1 mm <sup>2</sup> /s = 10 <sup>-6</sup> m <sup>2</sup> /s   |
| Dynamic viscosity     | Pa × s               | mPa × s                     | 1 mPa s = 10 <sup>-3</sup> Pa × s                           |
| Activity              | Bq (becquerel)       | –                           | –                                                           |
| Dose equivalent       | Sv (sievert)         | –                           | –                                                           |

#### Notes to 1.2.2.1:

*a The following round figures are applicable for the conversion of the units hitherto used into SI Units.*

#### **Force**

$$1 \text{ kg} = 9.807 \text{ N}$$

$$1 \text{ N} = 0.102 \text{ kg}$$

#### **Pressure**

$$1 \text{ Pa} = 1 \text{ N/m}^2 = 10^{-5} \text{ bar} = 1.02 \times 10^{-5} \text{ kg/cm}^2 = 0.75 \times 10^{-2} \text{ torr}$$

$$1 \text{ bar} = 10^5 \text{ Pa} = 1.02 \text{ kg/cm}^2 = 750 \text{ torr}$$

$$1 \text{ kg/cm}^2 = 9.807 \times 10^4 \text{ Pa} = 0.9807 \text{ bar} = 736 \text{ torr}$$

$$1 \text{ torr} = 1.33 \times 10^2 \text{ Pa} = 1.33 \times 10^{-3} \text{ bar} = 1.36 \times 10^{-3} \text{ kg/cm}^2$$

#### **Stress**

$$1 \text{ kg/mm}^2 = 9.807 \text{ N/mm}^2$$

$$1 \text{ N/mm}^2 = 0.102 \text{ kg/mm}^2$$

#### **Work, Energy, Quantity of heat**

$$1 \text{ J} = 1 \text{ Nm} = 0.278 \times 10^{-6} \text{ kWh} = 0.102 \text{ kgm} = 0.239 \times 10^{-3} \text{ kcal}$$

$$1 \text{ kWh} = 3.6 \times 10^6 \text{ J} = 367 \times 10^3 \text{ kgm} = 860 \text{ kcal}$$

$$1 \text{ kgm} = 9.807 \text{ J} = 2.72 \times 10^{-6} \text{ kWh} = 2.34 \times 10^{-3} \text{ kcal}$$

$$1 \text{ kcal} = 4.19 \times 10^3 \text{ J} = 1.16 \times 10^{-3} \text{ kWh} = 427 \text{ kgm}$$

#### **Power**

$$1 \text{ W} = 0.102 \text{ kgm/s} = 0.86 \text{ kcal/h}$$

$$1 \text{ kgm/s} = 9.807 \text{ W} = 8.43 \text{ kcal/h}$$

$$1 \text{ kcal/h} = 1.16 \text{ W} = 0.119 \text{ kgm/s}$$

### **Kinematic viscosity**

$$1 \text{ m}^2/\text{s} = 10^4 \text{ St (Stokes)}$$

$$1 \text{ St} = 10^{-4} \text{ m}^2/\text{s}$$

### **Dynamic viscosity**

$$1 \text{ Pa} \times \text{s} = 1 \text{ Ns/m}^2 = 10 \text{ P (poise)} = 0.102 \text{ kgs/m}^2$$

$$1 \text{ P} = 0.1 \text{ Pa} \times \text{s} = 0.1 \text{ Ns/m}^2 = 1.02 \times 10^{-2} \text{ kgs/m}^2$$

$$1 \text{ kgs/m}^2 = 9.807 \text{ Pa} \times \text{s} = 9.807 \text{ Ns/m}^2 = 98.07 \text{ P}$$

*<sup>b</sup> The International System of Units (SI) is the result of decisions taken at the General Conference on Weights and Measures (Address: Pavillon de Breteuil, Parc de St-Cloud, F-92 310 Sèvres).*

*<sup>c</sup> In this Code, the abbreviation "L" is used for litre in place of "l" because of the difficulty of distinguishing between numeral "1" and letter "l".*

The decimal multiples and sub-multiples of a unit may be formed by prefixes or symbols, having the following meanings, placed before the name or symbol of the unit, as shown below:

| <b><u>Factor</u></b>      |   |                            | <b><u>Prefix</u></b> | <b><u>Symbol</u></b> |
|---------------------------|---|----------------------------|----------------------|----------------------|
| 1,000,000,000,000,000,000 | = | $10^{18}$ (quintillion)    | exa                  | E                    |
| 1,000,000,000,000,000     | = | $10^{15}$ (quadrillion)    | peta                 | P                    |
| 1,000,000,000,000         | = | $10^{12}$ (trillion)       | tera                 | T                    |
| 1,000,000,000             | = | $10^9$ (billion)           | giga                 | G                    |
| 1,000,000                 | = | $10^6$ (million)           | mega                 | M                    |
| 1,000                     | = | $10^3$ (thousand)          | kilo                 | k                    |
| 100                       | = | $10^2$ (hundred)           | hecto                | h                    |
| 10                        | = | $10^1$ (ten)               | deca                 | da                   |
| 0.1                       | = | $10^{-1}$ (tenth)          | deci                 | d                    |
| 0.01                      | = | $10^{-2}$ (hundredth)      | centi                | c                    |
| 0.001                     | = | $10^{-3}$ (thousandth)     | milli                | m                    |
| 0.000,001                 | = | $10^{-6}$ (millionth)      | micro                | $\mu$                |
| 0.000,000,001             | = | $10^{-9}$ (billionth)      | nano                 | n                    |
| 0.000,000,000,001         | = | $10^{-12}$ (trillionth)    | pico                 | p                    |
| 0.000,000,000,000,001     | = | $10^{-15}$ (quadrillionth) | femto                | f                    |
| 0.000,000,000,000,000,001 | = | $10^{-18}$ (quintillionth) | atto                 | a                    |

*Note:  $10^9$  = 1 billion is United Nations usage in English. By analogy, so  $10^{-9}$  = 1 billionth.*

### 1.2.2.2

### Deleted

### 1.2.2.3

Whenever the weight of a package is mentioned, the gross mass is meant unless otherwise stated. The mass of containers or tanks used for the transport of goods is not included in the gross mass.

### 1.2.2.4

Unless expressly stated otherwise, the sign “%” represents:

- (a) in the case of mixtures of solids or of liquids, and also in the case of solutions and of solids wetted by a liquid: a percentage mass based on the total mass of the mixture, the solution or the wetted solid;
- (b) in the case of mixtures of compressed gases: when filled by pressure, the proportion of the volume indicated as a percentage of the total volume of the gaseous mixture, or, when filled by mass, the proportion of the mass indicated as a percentage of the total mass of the mixture;
- (c) in the case of mixtures of liquefied gases and gases dissolved under pressure: the proportion of the mass indicated as a percentage of the total mass of the mixture.

### 1.2.2.5

Pressures of all kinds relating to receptacles (such as test pressure, internal pressure, safety-valve opening pressure) are always indicated in gauge pressure (pressure in excess of atmospheric pressure); however, the vapour pressure of substances is always expressed in absolute pressure.

### Codes, standards and rules referred to in this Code

In this Code, unless the contrary intention appears:

**ADR** means “Accord Relatif au Transport International des Marchandises Dangereuses par Route” (Agreement Concerning the International Carriage of Dangerous Goods by Road), published by the Inland Transport Committee of the Economic Commission for Europe;

**Australian Explosives Code**<sup>1</sup> means the “Australian Code for the Transport of Explosives by Road and Rail”, published by Safework Australia;

<https://www.safeworkaustralia.gov.au/doc/australian-code-transport-explosives-road-and-rail-3rd-edition>.

**Australian Standard** means a standard published by Standards Australia (Standards Australia, <<https://www.standards.org.au/>> 286 Sussex Street, GPO Box 476, Sydney, NSW, 2001, Australia). (A list of Standards referred to in this Code is set out in Table 1.1)

**Code for the Safe Transport of Radioactive Material** means the Code and Guides published by the Australian Radiation Protection and

Nuclear Safety Agency ARPANSA <[www.arpansa.gov.au/Publications/codes/rps.cfm](http://www.arpansa.gov.au/Publications/codes/rps.cfm)>

**EN** (standard)) means a European standard published by the European Committee for Standardisation (CEN) (CEN – 36 rue de Stassart, B-1050 Brussels, Belgium)

<[www.en-standard.eu/store/?gclid=CI2rz\\_mStcICFUUHvAodLBIApw](http://www.en-standard.eu/store/?gclid=CI2rz_mStcICFUUHvAodLBIApw)>

**GHS** means the current edition of the Globally Harmonized System of classification and labelling of chemicals, published by the United Nations.

**IATA Regulations** means the “Dangerous Goods Regulations” published by the International Air Transport Association (IATA) <[www.iata.org/publications/dgr/Pages/index.aspx](http://www.iata.org/publications/dgr/Pages/index.aspx)>

**ICAO Rules** means the “Technical Instructions for the Safe Transport of Dangerous Goods by Air” published by the International Civil Aviation Organisation (ICAO) <<https://www.icao.int/safety/DangerousGoods/Pages/Doc9284-Technical-Instructions.aspx>>

**IMDG Code** means the “International Maritime Dangerous Goods Code” published by the International Maritime Organisation (IMO) <<https://www.imo.org/en/publications/Pages/IMDG%20Code.aspx>>

**International Convention for Safe Containers** means the “International Convention for Safe Containers”, 1972

**ISO** (standard) means an international standard published by the International Organisation for Standardisation (ISO - 1, rue de Varembé, CH-1204 Geneva 20, Switzerland) (A list of Standards referred to in this Code is set out in Table 1.1); <[www.iso.org/iso/home.html](http://www.iso.org/iso/home.html)>

**Load Restraint Guide** means the document of that name prepared by the National Transport Commission<sup>1</sup>

**Preparation of Safety Data Sheets for Hazardous Chemicals Code of Practice** means the code of that name published by Safe Work Australia, ISBN 978-0-6442-33311-7, 2016;

**OECD Guidelines for the testing of Chemicals** means the document of that name published by the Organisation for Economic Co-operation and Development.

**RID** means “Reglements Internationales Relatif au Transport des Marchandises Dangereuses par Chemin de Fer” (Regulations concerning the International carriage of Dangerous goods by rail) published by the Inland Transport Committee of the Economic Commission for Europe

**The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification** means the document of that name published jointly by the United Nations Environment Programme, the

**UN23<sup>1</sup>** means those Model Regulations annexed to the 22nd revised edition of the “Recommendations on the Transport of Dangerous Goods” published by the United Nations

## References to other codes, standards and international rules

## References to other codes, standards and international rules

1.2.3.2.2 In this Code, a reference to a code, standard or international rule is a reference to the latest edition of that code, standard or international rule. However, the previous edition of a code, standard or international rule may continue to be used for 12 months after the date of publication of the latest edition unless a defined transition period is specified.

1.2.3.2.3 If a code, standard or international rule, or a provision of a code, standard or international rule:

- the provision of this Code prevails.

1.2.3.2.5 If a word or expression is defined:

- (a) in a document referred to in this Code; and
- (b) in 1.2.1 of this Code using a different form of words but in a manner that expresses the same idea as the definition in the document referred to;
- (c) the expression is taken, as far as practicable, to have the same meaning as it has in the document referred to in this Code.

<sup>1</sup>Where used, the terms UN13, UN14, UN15, UN16, UN17, UN18, UN19, UN20, UN 21, UN22 and UN23 have the corresponding meanings and refer to the relevant edition of UN document 'Recommendations on the Transport of Dangerous Goods Model Regulations'.

Reference is by number first, then alphabetically, with SA read as AS and SNZ read as NZS. Reference includes any amendments.

### 1.2.3.3 Interpretation of references to GHS

#### 1.2.3.3.1

For the purposes of this Code, a 'thing' is marked in accordance with GHS if the marking complies with the version of GHS that applies in the jurisdiction of origin of the thing, or if the marking otherwise complies with the GHS law in that jurisdiction, and if any words in the marking are in English.

## CHAPTER 1.3: TRAINING

### Reserved

**NOTE:** Chapter 1.3 of UN23 outlines general training issues that are addressed by Division 1.3 of the Model subordinate instrument.

## CHAPTER 1.4: SECURITY PROVISIONS

### Reserved

**NOTE:** Chapter 1.4 of UN23 outlines general approaches that can be applied by competent authorities to maintaining security of dangerous goods transport. This is a regulatory issue that is outside the scope of this Code.

In Australia refer to the Cyber and Infrastructure Security Centre. <<https://www.cisc.gov.au/>> or State or Territory authorities.

## CHAPTER 1.5: GENERAL PROVISIONS CONCERNING CLASS 7

### Reserved

**NOTE:** Chapter 1.5 of UN23 lists general provisions to the transport of Class 7 Radioactive material. This section of the UN Model Regulation falls outside of the scope of this Code and the Model Transport Regulations.

Refer to the following information from the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) now replaces the information found in earlier editions of the ADG Code.

<https://www.arpansa.gov.au/regulation-and-licensing/regulatory-publications/radiation-protection-series/codes-and-standards/rpsc-2>

# **PART 2**

# **CLASSIFICATION**

## CHAPTER 2.0: INTRODUCTION

### Introductory Notes

**NOTE 1:** This Part reproduces Part 2 of the UN23rd revised edition of the UN Model Regulations, except where indicated by the word “Reserved” indicating a clause that has been omitted.

**NOTE 2:** This Part provides the rules for classifying all classes of dangerous goods including Class 1 and Class 7 dangerous goods which are not subject to this Code, except insofar as they are transported with other dangerous goods and may be Regulated by State and Federal laws other than Dangerous Goods. Chapters 2.1 and 2.7 are therefore provided for information purposes only. For Classes 1 and 7, reference should be made to the Australian Explosives Code or the Code for the Safe Transport of Radioactive Material as appropriate and the legislation covering transport of those classes in the particular jurisdiction.

**NOTE 3:** Where in this Part there is a statement that particular substances or articles are ‘not subject to this Code’, then those substances or articles are not considered to be dangerous goods for the purposes of this Code or the Regulations provided that all conditions included with that statement are met. This also applies to substances and articles for which there is a reference in Column 6 of the Dangerous Goods List in Chapter 3.2 to a Special Provision in Chapter 3.3 that incorporates such a statement.

#### 2.0.0

#### RESERVED

**NOTE:** Section 2.0.0 of UN23 assigns responsibilities for classifying dangerous goods. In Australia, these responsibilities are assigned by the Regulations, or by State or Territory legislation concerning the transport of explosives or radioactive substances or for storage and handling of dangerous goods.

#### 2.0.1

#### CLASSES, DIVISIONS, PACKING GROUPS

##### 2.0.1.1

##### Definitions

Substances (including mixtures and solutions) and articles subject to this Code are assigned to one of nine classes according to the hazard or the most predominant of the hazards they present. Some of these classes are subdivided into divisions. These classes and divisions are:

#### Class 1:

#### Explosives

**Division 1.1:** Substances and articles which have a mass explosion hazard

**Division 1.2:** Substances and articles which have a projection hazard but not a mass explosion hazard

**Division 1.3:** Substances and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard

**Division 1.4:** Substances and articles which present no significant hazard

**Division 1.5:** Very insensitive substances which have a mass explosion hazard

**Division 1.6:** Extremely insensitive articles which do not have a mass explosion hazard

**Class 2: Gases**

**Division 2.1:** Flammable gases

**Division 2.2:** Non-flammable, non-toxic gases

**Division 2.3:** Toxic

**Class 3: Flammable liquids**

**Class 4: Flammable solids; substances liable to spontaneous combustion; substances which, on contact with water, emit flammable gases**

**Division 4.1:** Flammable solids, self-reactive substances solid desensitised explosives and polymerizing substances

**Division 4.2:** Substances liable to spontaneous combustion

**Division 4.3:** Substances which in contact with water emit flammable gases

**Class 5: Oxidising substances and organic peroxides**

**Division 5.1:** Oxidising substances

**Division 5.2:** Organic peroxides

**Class 6: Toxic and infectious substances**

**Division 6.1:** Toxic substances

**Division 6.2:** Infectious substances

**Class 7: Radioactive material**

**Class 8: Corrosive substances**

**Class 9: Miscellaneous dangerous substances and articles, including environmentally hazardous substances**

The numerical order of the classes and divisions is not that of the degree of danger.

2.0.1.2 Many of the substances assigned to Classes 1 to 9 are deemed, without additional labelling, as being environmentally hazardous.

2.0.1.2.1 Wastes must be transported under the requirements of the appropriate class considering their hazards and the criteria in this Code.

Wastes not otherwise subject to this Code but covered under the Basel Convention<sup>1</sup> may be transported under Class 9.

2.0.1.3

For packing purposes, substances other than those of Classes 1, 2 and 7, Divisions 5.2 and 6.2, and other than self-reactive substances of Division 4.1, are assigned to three packing groups in accordance with the degree of danger they present:

Packing group I: Substances presenting high danger;

Packing group II: Substances presenting medium danger; and

Packing group III: Substances presenting low danger.

The packing group to which a substance is assigned is indicated in the Dangerous Goods List in chapter 3.2.

Articles are not assigned to packing groups. For packing purposes any requirement for a specific packaging performance level is set out in the applicable packing instruction.

2.0.1.4

Dangerous goods are determined to present one or more of the dangers represented by Classes 1 to 9 and divisions and, if applicable, the degree of danger on the basis of the requirements in chapters 2.1 to 2.9.

2.0.1.5

Dangerous goods presenting a danger of a single class and division are assigned to that class and division and the degree of danger (packing group), if applicable, determined. When an article or substance is specifically listed by name in the Dangerous Goods List in chapter 3.2, its class or division, its subsidiary hazard(s) and, when applicable, its packing group are taken from this list.

2.0.1.6

Dangerous goods meeting the defining criteria of more than one hazard class or division and which are not listed by name in the Dangerous Goods List, are assigned to a class and division and subsidiary hazard (s) on the basis of the precedence of hazards in 2.0.3.

## 2.0.2

## UN NUMBERS AND PROPER SHIPPING NAMES

2.0.2.1

Dangerous goods are assigned to UN numbers and proper shipping names according to their hazard classification and their composition.

---

<sup>1</sup>Basel Convention on the Control of 2. Transboundary Movements of Hazardous Wastes and their Disposal (1989).

#### 2.0.2.2

Dangerous goods commonly carried are listed in the Dangerous Goods List in chapter 3.2. Where an article or substance is specifically listed by name, it must be identified in transport by the proper shipping name in the Dangerous Goods List. Such substances may contain technical impurities (for example those deriving from the production process) or additives for stability or other purposes that do not affect their classification. However, a substance listed by name containing technical impurities or additives for stability or other purposes affecting its classification must be considered a mixture or solution (see 2.0.2.5). For dangerous goods not specifically listed by name, “generic” or “not otherwise specified” entries are provided (see 2.0.2.7) to identify the article or substance in transport. The substances listed by name in column (2) of the Dangerous Goods List of chapter 3.2 shall be transported according to their classification in the list or under the conditions specified in 2.0.0.2.. Each entry in the Dangerous Goods List is characterised by a UN number. This list also contains relevant information for each entry, such as hazard class, subsidiary hazard(s) (if any), packing group (where assigned), packing and tank transport requirements, etc. Entries in the Dangerous Goods List are of the following four types:

- (a) Single entries for well-defined substances or articles e.g.
  - 1090 ACETONE
  - 1194 ETHYL NITRITE SOLUTION;
- (b) Generic entries for a well-defined group of substances or articles e.g.
  - 1133 ADHESIVES
  - 1266 PERFUMERY PRODUCT
  - 2757 CARBAMATE PESTICIDE, SOLID, TOXIC
  - 3101 ORGANIC PEROXIDE, TYPE B, LIQUID;
- (c) Specific N.O.S. entries covering a group of substances or articles of a particular chemical or technical nature e.g.
  - 1477 NITRATES, INORGANIC, N.O.S.
  - 1987 ALCOHOLS, N.O.S.;
- (a) General N.O.S. entries covering a group of substances or articles meeting the criteria of one or more classes or divisions e.g.
  - 1325 FLAMMABLE SOLID, ORGANIC, N.O.S.
  - 1993 FLAMMABLE LIQUID, N.O.S.

#### 2.0.2.3

All self-reactive substances of Division 4.1 are assigned to one of twenty generic entries in accordance with the classification principles and flow chart described in 2.4.2.3.3 and Figure 2.4.1.

#### 2.0.2.4

All organic peroxides of Division 5.2 are assigned to one of twenty generic entries in accordance with the classification principles and flow chart described in 2.5.3.3 and Figure 2.5.1.

- 2.0.2.5 A mixture or solution meeting the classification criteria of this Code composed of a single predominant substance identified by name in the Dangerous Goods List and one or more substances not subject to this Code and/or traces of one or more substances identified by name in the Dangerous Goods List, must be assigned the UN number and proper shipping name of the predominant substance named in the Dangerous Goods List unless:
- (a) the mixture or solution is identified by name in the Dangerous Goods List;
  - (b) the name and description of the substance named in the Dangerous Goods List specifically indicate that they apply only to the pure substance;
  - (c) the hazard class or division, subsidiary hazard(s), packing group, or physical state of the mixture or solution is different from that of the substance named in the Dangerous Goods List; or
  - (d) the hazard characteristics and properties of the mixture or solution necessitate emergency response measures that are different from those required for the substance identified by name in the Dangerous Goods List.
- In those other cases, except the one described in (a), the mixture or solution is to be treated as a dangerous substance not specifically listed by name in the Dangerous Goods List.
- 2.0.2.6 For a solution or mixture when the hazard class, the physical state or the packing group is changed in comparison with the listed substance, the appropriate N.O.S. entry must be used including its packaging and labelling provisions.
- 2.0.2.7 A mixture or solution containing one or more substances identified by name in this Code or classified under a N.O.S. entry and one or more substances is not subject to this Code if the hazard characteristics of the mixture or solution are such that they do not meet the criteria (including human experience criteria) for any class.
- 2.0.2.8 Substances or articles which are not specifically listed by name in the Dangerous Goods List must be classified under a “generic” or “not otherwise specified” (“N.O.S.”) entry. The substance or article must be classified according to the class definitions and test criteria in this Part, and the article or substance classified under the generic or “N.O.S.” entry in the Dangerous Goods List which most appropriately describes the article or substance<sup>1</sup>. This means that a substance is only to be assigned to an entry of type (c), as defined in 2.0.2.2, if it cannot be assigned to an entry of type (b), and to an entry of type (d) if it cannot be assigned to an entry of type (b) or (c)<sup>1</sup>.

---

<sup>1</sup>See also the “List of generic or N.O.S. proper shipping names” in 3.2.6.

2.0.2.9 A mixture or solution meeting the classification criteria of this Code that is not identified by name in the Dangerous Goods List and that is composed of two or more dangerous goods must be assigned to an entry that has the proper shipping name, description, hazard class or division, subsidiary hazards(s) and packing group that most precisely describe the mixture or solution.

## 2.0.3 PRECEDENCE OF HAZARD CHARACTERISTICS

2.0.3.1 The table below should be used to determine the class of a substance, mixture or solution having more than one hazard, when it is not named in the Dangerous Goods List in chapter 3.2 or to assign the appropriate entry for articles containing dangerous goods N.O.S. UN Nos. 3537 to 3548, see 2.0.5. For goods having multiple hazards which are not specifically listed by name in the Dangerous Goods List, the most stringent packing group denoted to the respective hazards of the goods takes precedence over other packing groups, irrespective of the precedence of hazard table in this chapter. The precedence of hazard characteristics of the following has not been dealt with in the Precedence of hazards Table in 2.0.3.3, as these primary characteristics always take precedence:

- (a) Substances and articles of Class 1;
- (b) Gases of Class 2;
- (c) Liquid desensitised explosives of Class 3;
- (d) Self-reactive substances and solid desensitised explosives of Division 4.1;
- (e) Pyrophoric substances of Division 4.2;
- (f) Substances of Division 5.2;
- (g) Substances of Division 6.1 with a packing group I inhalation toxicity<sup>1</sup>;
- (h) Substances of Division 6.2;
- (i) Material of Class 7.

2.0.3.2 Apart from radioactive material in excepted packages (where the other hazardous properties take precedence) radioactive material having other hazardous properties must always be classified in Class 7 and the subsidiary hazard must also be identified. For radioactive material in excepted packages, except for UN 3507, URANIUM HEXAFLUORIDE, RADIOACTIVE MATERIAL, EXCEPTED PACKAGE, special provision 290 of chapter 3.3 applies.

---

<sup>1</sup>Except for substances or preparations meeting the criteria of Class 8 having an inhalation toxicity of dusts and mists (LC<sub>50</sub>) in the range of packing group I, but toxicity through oral ingestion or dermal contact only in the range of packing group III or less, which must be allocated to Class 8.

**Table 2.0.3.3: Precedence of hazards**

| Class or Division<br>and Packing<br>Group |                  | 4.2 | 4.3 | 5.1<br>I | 5.1<br>II | 5.1<br>III | 6.1, I<br>Dermal | 6.1, I<br>Oral | 6.1<br>II | 6.1<br>III     | 8, I<br>Liquid | 8, I<br>Solid | 8, II<br>Liquid | 8, II<br>Solid | 8, III<br>Liquid | 8, III<br>Solid |

| 6.1                                       | II Dermal        |     |     |          |           |            |                  |                |           |                | 8              | 6.1           | 8               | 6.1            | 6.1              | 6.1             |
| 6.1                                       | II Oral          |     |     |          |           |            |                  |                |           |                | 8              | 8             | 8               | 6.1            | 6.1              | 6.1             |
| 6.1                                       | III              |     |     |          |           |            |                  |                |           |                | 8              | 8             | 8               | 8              | 8                | 8               |

**Table Notes:**

a. Substances of Division 4.1 other than self-reactive substances and solid desensitised explosives and substances of Class 3 other than liquid desensitised explosives.

b. 6.1 for pesticides.

— Denotes an unachievable combination.

For hazards not shown in this table, see 2.0.3.

## **2.0.4**

## **TRANSPORT OF SAMPLES**

### **2.0.4.1**

When the hazard class of a substance is uncertain and it is being transported for further testing, a tentative hazard class, proper shipping name and identification number must be assigned on the basis of the consignor's knowledge of the substance and application of:

- (a) the classification criteria of this Code; and
- (b) the precedence of hazards given in 2.0.3.

The most severe packing group possible for the proper shipping name chosen must be used.

Where this provision is used the proper shipping name must be supplemented with the word "SAMPLE" (e.g., FLAMMABLE LIQUID, N.O.S. SAMPLE). In certain instances, where a specific proper shipping name is provided for a sample of a substance considered to meet certain classification criteria (e.g. GAS SAMPLE, NON-PRESSURISED, FLAMMABLE, UN 3167) that proper shipping name must be used. When an N.O.S. entry is used to transport the sample, the proper shipping name need not be supplemented with the technical name as required by special provision 274.

### **2.0.4.2**

Samples of the substance must be transported in accordance with the requirements applicable to the tentative assigned proper shipping name provided:

- (a) the substance is not considered to be a substance prohibited for transport by 1.1.2;
- (b) the substance is not considered to meet the criteria for Class 1 or considered to be an infectious substance or a radioactive material;
- (c) the substance is in compliance with 2.4.2.3.2.4(b) or 2.5.3.2.5.1 if it is a self-reactive substance or an organic peroxide, respectively;
- (d) the sample is transported in a combination packaging with a net mass per package not exceeding 2.5 kg; and
- (e) the sample is not packed together with other goods.

## **2.0.4.3**

### **Samples of energetic materials for testing purposes**

### **2.0.4.3.1**

Samples of organic substances carrying functional groups listed in tables A6.1 and/or A6.3 in Appendix 6 (Screening Procedures of the Manual of Tests and Criteria may be transported under UN 3224 (self-reactive solid type C) or UN 3223 (self-reactive liquid type C), as applicable, of Division 4.1 provided that:

- (a) The samples do not contain any:
  - (i) Known explosives;
  - (ii) Substances showing explosive effects in testing;
  - (iii) Compounds designed with the view of producing a practical explosive or pyrotechnic effect; or
  - (iv) Components consisting of synthetic precursors of intentional explosives;
- (b) For mixtures, complexes or salts of inorganic oxidizing substances of Division 5.1 with organic material(s), the concentration of the inorganic oxidizing substance is:

- (i) Less than 15 %, by mass, if assigned to packing group I (high hazard) or II (medium hazard); or
- (ii) Less than 30 %, by mass, if assigned to packing group III (low hazard);
- (c) Available data do not allow a more precise classification;
- (d) The sample is not packed together with other goods; and
- (e) The sample is packed in accordance with packing instructions P520 and special packing provisions PP94 or PP95 of 4.1.4.1, as applicable.

## 2.0.5

### **CLASSIFICATION OF ARTICLES AS ARTICLES CONTAINING DANGEROUS GOODS N.O.S.**

**NOTE:** For articles which do not have an existing proper shipping name and which contain only dangerous goods within the permitted limited quantity amounts specified in Column 7a of the Dangerous Goods List, see UN No. 3363 and special provision 301 of chapter 3.3.

#### 2.0.5.1

Articles containing dangerous goods may be classified as otherwise provided by this Code under the proper shipping name for the dangerous goods they contain or in accordance with this section. For the purposes of this section “article” means machinery, apparatus or other devices containing one or more dangerous goods (or residues thereof) that are an integral element of the article, necessary for its functioning and that cannot be removed for the purpose of transport. An inner packaging shall not be an article.

#### 2.0.5.2

Such articles may in addition contain cells or batteries. Lithium cells and batteries that are integral to the article shall be of a type proven to meet the testing requirements of the Manual of Tests and Criteria, part III, sub-section 38.3. For articles containing pre-production prototype lithium cells or batteries transported for testing, or for articles containing lithium cells or batteries manufactured in production runs of not more than 100 cells or batteries, the requirements of special provision 310 of chapter 3.3 shall apply.

#### 2.0.5.3

This section does not apply to articles for which a more specific proper shipping name already exists in the Dangerous Goods List of chapter 3.2.

#### 2.0.5.4

This section does not apply to dangerous goods of Class 1, Division 6.2, Class 7 or radioactive material contained in articles. However, this section applies to articles containing explosives which are excluded from Class 1 in accordance with 2.1.3.6.4.

#### 2.0.5.5

Articles containing dangerous goods shall be assigned to the appropriate Class or Division determined by the hazards present using, where applicable, the Precedence of Hazards table in 2.0.3.3 for each of the dangerous goods contained in the article. If dangerous goods classified as Class 9 are contained within the article, all other dangerous goods present in the article shall be considered to present a higher hazard.

#### 2.0.5.6

Subsidiary hazards shall be representative of the primary hazard posed by the other dangerous goods contained within the article. When only one item of dangerous goods is present in the article, the subsidiary hazard(s), if any, shall be the subsidiary hazard(s) identified in column (4) of the Dangerous Goods List. If the article contains more than one item of dangerous goods and these could react dangerously with one another during transport, each of the dangerous goods shall be enclosed separately (see 4.1.1.6).

## CHAPTER 2.1: CLASS 1 - EXPLOSIVES

### Introductory Notes

**NOTE 1:** Chapter 2.1 is reproduced from UN23 for information purposes in order to provide a single Australian source document for classification criteria for all classes of dangerous goods.

**THE TRANSPORT OF CLASS 1 IS NOT SUBJECT TO THIS CODE.**

Transport of Class 1 by road or rail in Australia is subject to the Australian Explosives Code and separate State and Territory legislation. However, subject to that legislation, when other dangerous goods are being transported with Class 1 dangerous goods, the segregation requirements of Part 9 of this Code may apply (refer to State and Territory legislation).

**NOTE 2:** Class 1 is a restricted class, that is, only those explosive substances and articles that are listed in the Dangerous Goods List in Chapter 3.2 may be accepted for transport. However, competent authorities retain the right by mutual agreement to approve transport of explosive substances and articles for special purposes under special conditions. Therefore entries have been included in the Dangerous Goods List for “Substances, explosive, not otherwise specified” and “Articles, explosive, not otherwise specified”. It is the intention that these entries will be used only when no other method of operation is possible.

**NOTE 3:** General entries such as “Explosive, blasting, Type A” are used to allow for the transport of new substances. In preparing these requirements, military ammunition and explosives have been taken into consideration to the extent that they are likely to be transported by commercial carriers.

**NOTE 4:** A number of substances and articles in Class 1 are described in Appendix B<sup>1</sup> of UN23 and the Australian Explosives Code. These descriptions are given because a term may not be well-known or may be at variance with its usage for regulatory purposes.

**NOTE 5:** Class 1 is unique in that the type of packaging frequently has a decisive effect on the hazard and therefore on the assignment to a particular division. The correct division is determined by use of the procedures provided in this Chapter.

### 2.1.1

### DEFINITIONS AND GENERAL PROVISIONS

#### 2.1.1.1

Class 1 comprises:

- (a) Explosive substances (a substance which is not itself an explosive but which can form an explosive atmosphere of gas, vapour or dust is not included in Class 1), except those that are too dangerous to transport or those where the predominant hazard is appropriate to another class;
- (b) Explosive articles, except devices containing explosive substances in such quantity or of such a character that their inadvertent or accidental ignition or initiation during transport will not cause any effect external to the device either by projection, fire, smoke, heat or loud noise (see 2.1.3.6); and
- (c) substances and articles not mentioned under (a) and (b) which are manufactured with a view to producing a practical explosive or pyrotechnic effect.

---

<sup>1</sup>Appendix B from the UN Model Regulations are not included in this Code.

2.1.1.2 Transport of explosive substances which are unduly sensitive or so reactive as to be subject to spontaneous reaction is prohibited.

2.1.1.3 Definitions

For the purposes of UN23 and this Code, the following definitions apply:

- (a) **Explosive substance** is a solid or liquid substance (or a mixture of substances) which is in itself capable by chemical reaction of producing gas at such a temperature and pressure and at such a speed as to cause damage to the surroundings. Pyrotechnic substances are included even when they do not evolve gases;
- (b) **Pyrotechnic substance** is an explosive substance designed to produce an effect by heat, light, sound, gas or smoke or a combination of these as the result of non-detonative self-sustaining exothermic chemical reactions;
- (c) **Explosive article** is an article containing one or more explosive substances;
- (d) **Phlegmatised** means that a substance (or “phlegmatiser”) has been added to an explosive to enhance its safety in handling and transport. The phlegmatiser renders the explosive insensitive, or less sensitive, to the following actions: heat, shock, impact, percussion or friction. Typical phlegmatising agents include, but are not limited to: wax, paper, water, polymers (such as chlorofluoropolymers), alcohol and oils (such as petroleum jelly and paraffin).
- (e) **Explosive or pyrotechnic effect** means, in the context of 2.1.1.1 (c), an effect produced by self-sustaining exothermic chemical reactions including shock, blast, fragmentation, projection, heat, light, sound, gas and smoke.

2.1.1.4 Divisions

Class 1 is divided into six divisions as follows:

- (a) **Division 1.1** Substances and articles which have a mass explosion hazard (a mass explosion is one which affects almost the entire load virtually instantaneously);
- (b) **Division 1.2** Substances and articles which have a projection hazard but not a mass explosion hazard;
- (c) **Division 1.3** Substances and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard.

This division comprises substances and articles:

- (i) which give rise to considerable radiant heat; or
- (ii) which burn one after another, producing minor blast or projection effects or both;

- (d) **Division 1.4** Substances and articles which present no significant hazard

This division comprises substances and articles which present only a small hazard in the event of ignition or initiation during transport. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An

external fire will not cause virtually instantaneous explosion of almost the entire contents of the package;

**NOTE:** *Substances and articles of this division are in Compatibility Group S if they are so packaged or designed that any hazardous effects arising from accidental functioning are confined within the package unless the package has been degraded by fire, in which case all blast or projection effects are limited to the extent that they do not significantly hinder fire-fighting or other emergency response efforts in the immediate vicinity of the package.*

- (e) **Division 1.5** Very insensitive substances which have a mass explosion hazard

This division comprises substances which have a mass explosion hazard but are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions of transport;

**NOTE:** *The probability of transition from burning to detonation is greater when large quantities are carried in a ship.*

- (f) **Division 1.6** Extremely insensitive articles which do not have a mass explosion hazard

This division comprises articles which predominantly contain extremely insensitive substances and which demonstrate a negligible probability of accidental initiation or propagation.

**NOTE:** *The hazard from articles of Division 1.6 is limited to the explosion of a single article.*

#### 2.1.1.5

Any substance or article having or suspected of having explosive characteristics must first be considered for classification in Class 1 in accordance with the procedures in 2.1.3. Goods are not classified in Class 1 when:

- (a) unless specially authorised, the transport of an explosive substance is prohibited because sensitivity of the substance is excessive;
- (b) the substance or article comes within the scope of those explosive substances and articles which are specifically excluded from Class 1 by the definition of this class; or
- (c) the substance or article has no explosive properties.

### 2.1.2

#### COMPATIBILITY GROUPS

#### 2.1.2.1

Goods of Class 1 are assigned to one of six divisions, depending on the type of hazard they present (see 2.1.1.4) and to one of thirteen compatibility groups which identify the kinds of explosive substances and articles that are deemed to be compatible. The tables in 2.1.2.1.1 and 2.1.2.1.2 show the scheme of classification into compatibility groups, the possible hazard divisions associated with each group and the consequential classification codes.

**Table 2.1.2.1.1: Classification codes**

| <b>Description of substance or article to be classified</b>                                                                                                                                                                                                                                                                                                 | <b>Compatibility Group</b> | <b>Classification Code</b>   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|------------------------------|
| Primary explosive substance                                                                                                                                                                                                                                                                                                                                 | A                          | 1.1A                         |
| Article containing a primary explosive substance and not containing two or more effective protective features. Some articles, such as detonators for blasting, detonator assemblies for blasting and primers, cap-type, are included, even though they do not contain primary explosives                                                                    | B                          | 1.1B<br>1.2B<br>1.4B         |
| Propellant explosive substance or other deflagrating explosive substance or article containing such explosive substance                                                                                                                                                                                                                                     | C                          | 1.1C<br>1.2C<br>1.3C<br>1.4C |
| Secondary detonating explosive substance or black powder or article containing a secondary detonating explosive substance, in each case without means of initiation and without a propelling charge, or article containing a primary explosive substance and containing two or more effective protective features                                           | D                          | 1.1D<br>1.2D<br>1.4D<br>1.5D |
| Article containing a secondary detonating explosive substance, without means of initiation, with a propelling charge (other than one containing a flammable liquid or gel or hypergolic liquids)                                                                                                                                                            | E                          | 1.1E<br>1.2E<br>1.4E         |
| Article containing a secondary detonating explosive substance with its own means of initiation, with a propelling charge (other than one containing a flammable liquid or gel or hypergolic liquids) or without a propelling charge                                                                                                                         | F                          | 1.1F<br>1.2F<br>1.3F<br>1.4F |
| Pyrotechnic substance, or article containing a pyrotechnic substance, or article containing both an explosive substance and an illuminating, incendiary, tear - or smoke-producing substance (other than a water-activated article or one containing white phosphorus, phosphides a pyrophoric substance, a flammable liquid or gel, or hypergolic liquids) | G                          | 1.1G<br>1.2G<br>1.3G<br>1.4G |
| Article containing both an explosive substance and white phosphorus                                                                                                                                                                                                                                                                                         | H                          | 1.2H<br>1.3H                 |
| Article containing both an explosive substance and a flammable liquid or gel                                                                                                                                                                                                                                                                                | J                          | 1.1J<br>1.2J<br>1.3J         |
| Article containing both an explosive substance and a toxic chemical agent                                                                                                                                                                                                                                                                                   | K                          | 1.2K<br>1.3K                 |
| Explosive substance or article containing an explosive substance and presenting a special hazard (e.g. due to water-activation or presence of hypergolic liquids, phosphides or a pyrophoric substance) and needing isolation of each type (see 7.1.3.1.5 of UN23)                                                                                          | L                          | 1.1L<br>1.2L<br>1.3L         |
| Articles predominantly containing extremely insensitive substances                                                                                                                                                                                                                                                                                          | N                          | 1.6N                         |

| Description of substance or article to be classified                                                                                                                                                                                                                                                                                                                                                         | Compatibility Group | Classification Code |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|---------------------|
| Substance or article so packed or designed that any hazardous effects arising from accidental functioning are confined within the package unless the package has been degraded by fire, in which case all blast or projection effects are limited to the extent that they do not significantly hinder or prohibit fire fighting or other emergency response efforts in the immediate vicinity of the package | S                   | 1.4S                |

**Table notes:**

**NOTE 1:** Articles of compatibility groups D and E may be fitted or packed together with their own means of initiation provided that such means have at least two effective protective features designed to prevent an explosion in the event of accidental functioning of the means of initiation. Such articles and packages must be assigned to compatibility groups D or E.

**NOTE 2:** Articles of compatibility groups D and E may be packed together with their own means of initiation, which do not have two effective protective features when, in the opinion of the competent authority of the country of origin, the accidental functioning of the means of initiation does not cause the explosion of an article under normal conditions of transport. Such packages must be assigned to compatibility groups D or E.

2.1.2.1.2 Scheme of classification of explosives, combination of hazard division with compatibility group

**Table 2.1.2.1.2: Explosive compatibility group**

| Hazard Division | Compatibility Group |      |      |      |      |      |      |      |      |      |      |      |      | A-S<br>Σ |
|-----------------|---------------------|------|------|------|------|------|------|------|------|------|------|------|------|----------|
|                 | A                   | B    | C    | D    | E    | F    | G    | H    | J    | K    | L    | N    | S    |          |
| 1.1             | 1.1A                | 1.1B | 1.1C | 1.1D | 1.1E | 1.1F | 1.1G |      | 1.1J |      | 1.1L |      |      | 9        |
| 1.2             |                     | 1.2B | 1.2C | 1.2D | 1.2E | 1.2F | 1.2G | 1.2H | 1.2J | 1.2K | 1.2L |      |      | 10       |
| 1.3             |                     |      | 1.3C |      |      | 1.3F | 1.3G | 1.3H | 1.3J | 1.3K | 1.3L |      |      | 7        |
| 1.4             |                     | 1.4B | 1.4C | 1.4D | 1.4E | 1.4F | 1.4G |      |      |      |      |      | 1.4S | 7        |
| 1.5             |                     |      |      | 1.5D |      |      |      |      |      |      |      |      |      | 1        |
| 1.6             |                     |      |      |      |      |      |      |      |      |      |      | 1.6N |      | 1        |
| 1.1-1.6<br>Σ    | 1                   | 3    | 4    | 4    | 3    | 4    | 4    | 2    | 3    | 2    | 3    | 1    | 1    | 35       |

2.1.2.2 The definitions of compatibility groups in 2.1.2.1.1 are intended to be mutually exclusive, except for a substance or article which qualifies for Compatibility Group S. Since the criterion of Compatibility Group S is an empirical one, assignment to this Group is necessarily linked to the tests for assignment to Division 1.4.

## 2.1.3

## CLASSIFICATION PROCEDURE

### 2.1.3.1

### General

#### 2.1.3.1.1

Any substance or article having or suspected of having explosives characteristics must be considered for classification in Class 1. Substances and articles classified in Class 1 must be assigned to the appropriate division and compatibility group.

#### 2.1.3.1.2

Except for substances which are listed by their proper shipping name in the Dangerous Goods List in chapter 3.2, goods must not be offered for transport as Class 1 until they have been subjected to the classification procedure prescribed in this section. In addition, the classification procedure must be undertaken before a new product is offered for transport. In this context a new product is one which, in the opinion of the competent authority, involves any of the following:

- (a) a new explosive substance or a combination or a mixture of explosive substances which is considered to be significantly different from other combinations or mixtures already classified;
- (b) a new design of article or an article containing a new explosive substance or a new combination or mixture of explosive substances;
- (c) a new design of package for an explosive substance or article including a new type of inner packaging;

**NOTE:** *The importance of this can be overlooked unless it is realised that a relatively minor change in an inner or outer packaging can be critical and can convert a lesser hazard into a mass explosion hazard.*

#### 2.1.3.1.3

The producer or other applicant for classification of a product must provide adequate information concerning the names and characteristics of all explosive substances in the product and must furnish the results of all relevant tests which have been done. It is assumed that all the explosive substances in a new article have been properly tested and then approved.

#### 2.1.3.1.4

A report on the series of tests must be drawn up in accordance with the requirements of the competent authority. It must in particular contain information on:

- (a) the composition of the substance or the structure of the article;
- (b) the quantity of substance or number of articles per test;
- (c) the type and construction of the packaging;
- (d) the test assembly, including in particular the nature, quantity and arrangement of the means of initiation or ignition used;
- (e) the course of the test, including in particular the time elapsing until the occurrence of the first noteworthy reaction of the substance or article, the duration and characteristics of the reaction, and an estimate of the latter's completeness;
- (f) the effect of the reaction on the immediate surroundings (up to 25 m from the site of the test);
- (g) the effect of the reaction on the more remote surroundings (more than 25 m from the site of the test); and
- (h) the atmospheric conditions during the test.

2.1.3.1.5 Verification of the classification must be undertaken if the substance or article or its packaging is degraded and the degradation might affect the behaviour of the item in the tests.

## 2.1.3.2 Procedure

2.1.3.2.1 Figure 2.1.1 indicates the general scheme for classifying a substance or article which is to be considered for inclusion in Class 1. The assessment is in two stages. First, the potential of a substance or article to explode must be ascertained and its stability and sensitivity, both chemical and physical, must be shown to be acceptable. In order to promote uniform assessments by competent authorities, it is recommended that data from suitable tests be analysed systematically with respect to the appropriate test criteria using the flow chart of figure 10.2 in part I of the Manual of Tests and Criteria. If the substance or article is acceptable for Class 1 it is then necessary to proceed to the second stage, to assign the correct hazard division by the flow chart of figure 10.3 in the same publication.

2.1.3.2.2 The tests for acceptance and the further tests to determine the correct division in Class 1 are conveniently grouped into seven series as listed in part I of the Manual of Tests and Criteria. The numbering of these series relates to the sequence of assessing results rather than the order in which the tests are conducted.

2.1.3.2.3 Scheme of procedure for classifying a substance or article.

**NOTE 1:** *The competent authority which prescribes the definitive test method corresponding to each of the Test Types should specify the appropriate test criteria. Where there is international agreement on test criteria, the details are given in the publication referred to above describing the seven series of tests.*

**NOTE 2:** *The scheme of assessment is only designed for the classification of packaged substances and articles and for individual unpacked articles. Transport in freight containers, road vehicles and rail wagons may require special tests which take into consideration the quantity (self-confinement) and kind of substance and the container for the substance. Such tests may be specified by the competent authorities.*

**NOTE 3:** *Since there will be borderline cases with any scheme of testing there should be an ultimate authority who will make the final decision. Such a decision may not receive international acceptance and may therefore be valid only in the country where it is made. The United Nations Committee of Experts on the Transport of Dangerous Goods provides a forum for the discussion of borderline cases. Where international recognition is sought for a classification, the competent authority should submit full details of all tests made including the nature of any variations introduced.*

**Figure 2.1.1: Scheme of procedure for classifying a substance or article**

### 2.1.3.3

#### Acceptance procedure

##### 2.1.3.3.1

The results from preliminary tests and those from test series 1 to 4 are used to determine whether or not the product is acceptable for Class 1. If the substance is manufactured with a view to producing a practical explosive or pyrotechnic effect, it is unnecessary to conduct test series 1 and 2. If an article, a packaged article or a packaged substance is rejected by test series 3 and/or 4 it may be practicable to redesign the article or the packaging to render it acceptable.

**NOTE:** Some devices may function accidentally during transport. Theoretical analysis, test data or other evidence of safety should be provided to establish that such an event is very unlikely or that the consequences would not be significant. The assessment should take account of vibration related to the proposed modes of transport, static electricity, electromagnetic radiation at all relevant frequencies (maximum intensity  $100 \text{ W.m}^{-2}$ ), adverse climatic conditions and compatibility of explosive substances with glues, paints and packaging materials with which they may come in contact. All articles containing primary explosive substances should be assessed to evaluate the risk and consequences of accidental functioning during transport. The reliability of fuses should be assessed taking account of the number of independent safety features. All articles and packaged substances should be assessed to ensure they have been designed in a good workmanlike manner (e.g. there is no possibility of formation of voids or thin films of explosive substance, and no possibility of grinding or nipping explosive substances between hard surfaces).

2.1.3.3.2 A product that is determined to be not acceptable for Class 1 in accordance with 2.1.3.3.1 due to either sensitivity or instability must be assessed as too dangerous to be transported.

#### **2.1.3.4 Assignment to hazard divisions**

2.1.3.4.1 Assessment of the hazard division is usually made on the basis of test results. A substance or article must be assigned to the hazard division which corresponds to the results of the tests to which the substance or article, as offered for transport, has been subjected. Other test results, and data assembled from accidents which have occurred, may also be taken into account.

2.1.3.4.2 Test series 5, 6 and 7 are used for the determination of the hazard division. Test series 5 is used to determine whether a substance can be assigned to Division 1.5. Test series 6 is used for the assignment of substances and articles to Divisions 1.1, 1.2, 1.3 and 1.4. Test series 7 is used for the assignment of articles to Division 1.6.

2.1.3.4.3 In the case of Compatibility Group S the tests may be waived by the competent authority if classification by analogy is possible using test results for a comparable article.

#### **2.1.3.5 Assignment of fireworks to hazard divisions**

2.1.3.5.1 Fireworks must normally be assigned to hazard divisions 1.1, 1.2, 1.3, and 1.4 on the basis of test data derived from test series 6. However

- (a) waterfalls containing flash composition (see note 2 of 2.1.3.5.5) shall be classified as 1.1G regardless of the results of test series 6;
- (b) since the range of fireworks is very extensive and the availability of test facilities may be limited, assignment to hazard divisions may also be made in accordance with the procedure in 2.1.3.5.2.

- 2.1.3.5.2 Assignment of fireworks to UN Nos. 0333, 0334, 0335 or 0336, and assignment of articles to UN 0431 for those used for theatrical effects meeting the definition for article type and the 1.4G specification in the default fireworks classification table in 2.1.3.5.5 may be made on the basis of analogy, without the need for test series 6 testing, in accordance with the default fireworks classification table in 2.1.3.5.5. Such assignment must be made with the agreement of the competent authority. Items not specified in the table must be classified on the basis of test data derived from test series 6.
- NOTE 1:** *The addition of other types of fireworks to column 1 of the table in 2.1.3.5.5 should only be made on the basis of full test data submitted to the UN Sub-Committee of Experts on the Transport of Dangerous Goods for consideration.*
- NOTE 2:** *Test data derived by competent authorities which validates, or contradicts the assignment of fireworks specified in column 4 of the table in 2.1.3.5.5 to hazard divisions in column 5 should be submitted to the UN Sub-Committee of Experts on the Transport of Dangerous Goods for information (see also note 3 in 2.1.3.2.3).*
- 2.1.3.5.3 Where fireworks of more than one hazard division are packed in the same package they must be classified on the basis of the highest hazard division unless test data derived from test series 6 indicate otherwise.
- 2.1.3.5.4 The classification shown in the table in 2.1.3.5.5 applies only for articles packed in fibreboard boxes (4G).

#### 2.1.3.5.5

#### Default fireworks Classification table<sup>1</sup>

**NOTE 1:** References to percentages in the table, unless otherwise stated, are to the mass of all pyrotechnic substances (e.g. rocket motors, lifting charge, bursting charge and effects charge).

**NOTE 2:** “Flash composition” in this table refers to pyrotechnic substances in powder form or as pyrotechnic units as presented in the fireworks that are used in waterfalls, or to produce an aural effect or used as a bursting charge, or propellant charge unless:

- (a) The time taken for the pressure rise in the HSL Flash Composition Test in Appendix 7 of the Manual of Tests and Criteria is demonstrated to be more than 6 ms for 0.5 g of pyrotechnic substance; or
- (b) The pyrotechnic substance gives a negative “-” result in the US Flash Composition Test in Appendix 7 of the Manual of Tests and Criteria

**NOTE 3:** Dimensions in mm refer to:

- (a) For spherical and peanut shells the diameter of the sphere of the shell;
- (b) For cylinder shells the length of the shell;
- (c) For a shell in mortar, Roman candle, shot tube firework or mine the inside diameter of the tube comprising or containing the firework;
- (d) For a bag mine or cylinder mine, the inside diameter of the mortar intended to contain the mine.

**Table 2.1.3.5.5: Default fireworks classification table**

| Type                            | Includes: / Synonym:                                                                                                                                             | Definition                                                                                                                                                 | Specification     | Classification |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|----------------|
| Shell, spherical or cylindrical | Spherical display shell: aerial shell, colour shell, dye shell, multi-break shell, multi-effect shell, nautical shell, parachute shell, smoke shell, star shell; | Device with or without propellant charge, with delay fuse and bursting charge, pyrotechnic unit (s) or loose pyrotechnic substance and designed to be pro- | All report shells | 1.1G           |

<sup>1</sup> This table contains a list of firework classifications that may be used in the absence of test series 6 data (See 2.1.3.5.2).

| Type | Includes: / Synonym:                                                     | Definition                                                                                                                                     | Specification                                                                                                                              | Classification |
|------|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|----------------|
|      | report shell: maroon, salute, sound shell, thunderclap, aerial shell kit | jected from a mortar                                                                                                                           | Colour shell: $\geq 180$ mm                                                                                                                | 1.1G           |
|      |                                                                          |                                                                                                                                                | Colour shell: $< 180$ mm with $> 25\%$ flash composition, as loose powder and/ or report effects                                           | 1.1G           |
|      |                                                                          |                                                                                                                                                | Colour shell: $< 180$ mm with $\leq 25\%$ flash composition, as loose powder and/ or report effects                                        | 1.3G           |
|      |                                                                          |                                                                                                                                                | Colour shell: $\leq 50$ mm, or $\leq 60$ g pyrotechnic substance, with $\leq 2\%$ flash composition as loose powder and/ or report effects | 1.4G           |
|      | Peanut shell                                                             | Device with two or more spherical aerial shells in a common wrapper propelled by the same propellant charge with separate external delay fuses | The most hazardous spherical aerial shell determines the classification                                                                    |                |
|      | Preloaded mortar, shell in mortar                                        | Assembly comprising a spherical or cylindrical shell inside a mortar from which the shell is designed to be projected                          | All report shells                                                                                                                          | 1.1G           |

|                |                                                                                                       |                                                                                                                    | $\leq 1$ g flash composition per item and $\leq 10$ g per inner packaging or $\leq 10$ g black powder per item | 1.4G           |

## 2.1.3.6

### Exclusion from Class 1

#### 2.1.3.6.1

The competent authority may exclude an article or substance from Class 1 by virtue of test results and the Class 1 definition.

#### 2.1.3.6.2

Where a substance provisionally accepted into Class 1 is excluded from Class 1 by performing test series 6 on a specific type and size of package, this substance, when meeting the classification criteria or definition for another class or division, should be listed in the Dangerous Goods List of chapter 3.2 in that class or division with a special provision restricting it to the type and size of package tested.

#### 2.1.3.6.3

Where a substance is assigned to Class 1 but is diluted to be excluded from Class 1 by test series 6, this diluted substance (hereafter referred to as desensitised explosive) must be listed in the Dangerous Goods List of chapter 3.2 with an indication of the highest concentration which excluded it from Class 1 (see 2.3.1.4 and 2.4.2.4.1) and if applicable, the concentration below which it is no longer deemed subject to this Code. New solid desensitised explosives subject to this Code must be listed in Division 4.1 and new liquid desensitised explosives must be listed in Class 3. When the desensitised explosive meets the criteria or definition for another class or division, the corresponding subsidiary hazard(s) must be assigned to it.

#### 2.1.3.6.4

An article may be excluded from Class 1 when three unpackaged articles, each individually activated by its own means of initiation or ignition or external means to function in the designed mode, meet the following test criteria:

- (a) No external surface is to have a temperature of more than 65° C. A momentary spike in temperature up to 200 °C is acceptable;
- (b) No rupture or fragmentation of the external casing or movement of the article or detached parts thereof of more than one metre in any direction;  
**NOTE:** *Where the integrity of the article may be affected in the event of an external fire these criteria are to be examined by a fire test. One such method is described in ISO 14451-2 using a heating rate of 80 K/min.*
- (c) No audible report exceeding 135 dB(C) peak at a distance of one metre;
- (d) No flash or flame capable of igniting a material such as a sheet of 80 ± 10 g/m<sup>2</sup> paper in contact with the article; and
- (e) No production of smoke, fumes or dust in such quantities that the visibility in a one cubic metre chamber equipped with appropriately sized blow out panels is reduced more than 50% as measured by a calibrated light (lux) meter or radiometer located one metre from a constant light source located at the midpoint on opposite walls. The general guidance on Optical Density Testing in ISO 5659-1 and the general guidance on the Photometric System described in section 7.5 in ISO 5659-2 may be used or similar optical density measurement methods designed to accomplish the same purpose may also be employed. A suitable hood cover surrounding the back and

sides of the light meter are to be used to minimise effects of scattered or leaking light not emitted directly from the source.

**NOTE 1:** *If during the tests addressing criteria (a), (b), (c) and (d) no or very little smoke is observed the test described in (e) may be waived.*

**NOTE 2:** *The competent authority may require testing in packaged form if it is determined that, as packaged for transport, the article may pose a greater hazard.*

## 2.1.3.7

### Classification documentation

#### 2.1.3.7.1

A competent authority assigning an article or substance into Class 1 should confirm with the applicant that classification in writing.

#### 2.1.3.7.2

A competent authority classification document may be in any form and may consist of more than one page, provided pages are numbered consecutively. The document should have a unique reference.

#### 2.1.3.7.3

The information provided shall be easy to identify, legible and durable.

#### 2.1.3.7.4

Examples of the information that may be provided in the classification documents are as follows:

- (a) The name of the competent authority and the provisions in national legislation under which it is granted its authority;
- (b) The modal or national regulations for which the classification document is applicable;
- (c) Confirmation that the classification has been approved, made or agreed in accordance with the United Nations Recommendations on the Transport of Dangerous Goods or the relevant modal regulations;
- (d) The name and address of the person in law to which the classification has been assigned and any company registration which uniquely identifies a company or other body corporate under national legislation;
- (e) The name under which the explosives will be placed onto the market or otherwise supplied for transport;
- (f) The Proper Shipping Name, UN number, Class, Hazard Division and corresponding compatibility group of the explosives;
- (g) Where appropriate, the maximum net explosive mass of the package or article;
- (h) The name, signature, stamp, seal or other identification of the person authorised by the competent authority to issue the classification document is clearly visible;
- (i) Where safety in transport or the hazard division is assessed as being dependent upon the packaging, the packaging mark or a description of the permitted:
  - Inner packagings
  - Intermediate packagings
  - Outer packagings
- (j) The classification document states the part number, stock number or other identifying reference under which the explosives will be placed onto the market or otherwise supplied for transport;

- (k) The name and address of the person in law who manufactured the explosives and any company registration which uniquely identifies a company or other body corporate under national legislation;
- (l) Any additional information regarding the applicable packing instruction and special packing provisions where appropriate;
- (m) The basis for assigning the classification, i.e. whether on the basis of test results, default for fireworks, analogy with classified explosive, by definition from the Dangerous Goods List etc.;
- (n) Any special conditions or limitations that the competent authority has identified as relevant to the safety for transport of the explosives, the communication of the hazard and international transport;
- (o) The expiry date of the classification document is given where the competent authority considers one to be appropriate.

## CHAPTER 2.2: CLASS 2 - GASES

### 2.2.1

#### DEFINITIONS AND GENERAL PROVISIONS

#### 2.2.1.1

A gas is a substance which:

- (a) at 50° C has a vapour pressure greater than 300 kPa; or
- (b) is completely gaseous at 20° C at a standard pressure of 101.3 kPa.

#### 2.2.1.2

The transport condition of a gas is described according to its physical state as:

- (a) Compressed gas - a gas which when packaged under pressure for transport is entirely gaseous at -50° C; this category includes all gases with a critical temperature less than or equal to -50° C;
- (b) Liquefied gas - a gas which when packaged under pressure for transport is partially liquid at temperatures above -50° C. A distinction is made between:
  - (i) High pressure liquefied gas - a gas with a critical temperature between -50° C and +65° C, and
  - (ii) Low pressure liquefied gas - a gas with a critical temperature above +65° C;
- (c) Refrigerated liquefied gas - a gas which when packaged for transport is made partially liquid because of its low temperature.
- (d) Dissolved gas - a gas which when packaged under pressure for transport is dissolved in a liquid phase solvent.
- (e) Adsorbed gas - a gas which when packaged for transport is adsorbed onto a solid porous material resulting in an internal receptacle pressure of less than 101.3 kPa at 20° C and less than 300 kPa at 50° C.

#### 2.2.1.3

The class comprises compressed gases, liquefied gases, dissolved gases, refrigerated liquefied gases, adsorbed gases, mixtures of one or more gases with one or more vapours of substances of other classes, articles charged with a gas, aerosols and chemicals under pressure.

### 2.2.2

#### DIVISIONS

#### 2.2.2.1

Substances of Class 2 are assigned to one of three divisions based on the primary hazard of the gas during transport.

**NOTE:** For UN 1950 AEROSOLS, see also the criteria in special provision 63. For chemicals under pressure of UN Nos. 3500 to 3505, see also special provision 362. For UN 2037 RECEPTACLES, SMALL, CONTAINING GAS (GAS CARTRIDGES) see also special provision 303.

- (a) Division 2.1: Flammable gases

Gases which at 20° C and a standard pressure of 101.3 kPa:

- (i) are ignitable when in a mixture of 13 per cent or less by volume with air; or
- (ii) have a flammable range with air of at least 12 percentage points regardless of the lower flammability limit. Flammability should be determined by tests or by calculation in accordance

with methods adopted by ISO (see ISO 10156:2017). Where insufficient data are available to use these methods, tests by a comparable method recognised by the competent authority may be used;

(b) Division 2.2: Non-flammable, non-toxic gases

Gases which:

- (i) are asphyxiant – gases which dilute or replace the oxygen normally in the atmosphere; or
- (ii) are oxidising – gases which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does; or
- (iii) do not come under the other divisions;

**NOTE:** In 2.2.2.1 (b) (ii), "gases which cause or contribute to the combustion of other material more than air does" means pure gases or gas mixtures with an oxidising power greater than 23.5% as determined by a method specified in ISO 10156:2017.

(c) Division 2.3: Toxic gases

Gases which:

- (i) are known to be so toxic or corrosive to humans as to pose a hazard to health; or
- (ii) are presumed to be toxic or corrosive to humans because they have an LC<sub>50</sub> value (as defined in 2.6.2.1) equal to or less than 5,000 ml/m<sup>3</sup> (ppm).

**NOTE:** Gases meeting the above criteria owing to their corrosivity are to be classified as toxic with a subsidiary corrosive hazard.

2.2.2.2 Gases and gas mixtures with hazards associated with more than one division take the following precedence:

- (a) Division 2.3 takes precedence over all other divisions;
- (b) Division 2.1 takes precedence over Division 2.2.

2.2.2.3 Gases of Division 2.2 are not subject to this Code if they are transported at a pressure of less than 200 kPa at 20° C and are not liquefied or refrigerated liquefied gases.

2.2.2.4 Gases of Division 2.2 are not subject to this Code when contained in the following:

- (a) Foodstuffs, including carbonated beverages (except UN 1950);
- (b) Balls intended for use in sports; or
- (c) Tyres (except for air transport).

**NOTE:** This exemption does not apply to lamps. For lamps see 1.1.1.9.

## 2.2.3 MIXTURES OF GASES

Gas mixtures are to be classified in one of the three divisions (including vapours of substances from other classes) by applying the following procedures:

- (a) Flammability is determined by tests or by calculation in accordance with methods adopted by ISO (see ISO 10156:2017). Where insufficient data are available to use these methods, tests by a comparable method recognised by the competent authority may be used;
- (b) The level of toxicity is determined either by tests to measure the LC<sub>50</sub> value (as defined in 2.6.2.1) or by a calculation method using the following formula:

$$LC_{50} \text{ Toxic (mixture)} = \frac{1}{\sum_{i=1}^n \frac{f_i}{T_i}}$$

where:

$f_i$  = mole fraction of the  $i^{\text{th}}$  component substance of the mixture

$T_i$  = Toxicity index of the  $i^{\text{th}}$  component substance of the mixture (the  $T_i$  equals the LC<sub>50</sub> value when available).

When LC<sub>50</sub> values are unknown the toxicity index is determined by using the lowest LC<sub>50</sub> value of substances of similar physiological and chemical effects, or through testing if this is the only practical possibility;

- (c) A gas mixture has a subsidiary hazard of corrosivity when the mixture is known by human experience to be destructive to the skin, eyes or mucous membranes or when the LC<sub>50</sub> value of the corrosive components of the mixture is equal to or less than 5,000 ml/m<sup>3</sup> (ppm) when the LC<sub>50</sub> is calculated by the formula:

$$LC_{50} \text{ Corrosive (mixture)} = \frac{1}{\sum_{i=1}^n \frac{f_{ci}}{T_{ci}}}$$

where:

$f_{ci}$  = mole fraction of the  $i^{\text{th}}$  corrosive component substance of the mixture

$T_{ci}$  = Toxicity index of the  $i^{\text{th}}$  corrosive component substance of the mixture (the  $T_{ci}$  equals the LC<sub>50</sub> value when available);

- (d) Oxidising ability is determined either by tests or by calculation methods adopted by ISO (see the Note in 2.2.2.1 (b) and ISO 10156:2017).

#### **2.2.4**

#### **GASES NOT ACCEPTED FOR TRANSPORT**

Chemically unstable gases of Class 2 shall not be accepted for transport unless the necessary precautions have been taken to prevent the possibility of a dangerous decomposition or polymerization under normal conditions of transport or unless transported in accordance with special packing provision (r) of packing instruction P200 (5) of 4.1.4.1, as applicable. For the precautions necessary to prevent polymerization, see special provision 386 of chapter 3.3. To this end particular care shall be taken to ensure that receptacles and tanks do not contain any substances liable to promote these reactions.

## CHAPTER 2.3: CLASS 3 – FLAMMABLE LIQUIDS

### Introductory Notes

**NOTE 1:** The word “flammable” has the same meaning as “inflammable”.

**NOTE 2:** The flash point of a flammable liquid may be altered by the presence of an impurity. The substances listed in Class 3 in the Dangerous Goods List in Chapter 3.2 should generally be regarded as chemically pure. Since commercial products may contain added substances or impurities, flash points may vary, and this may have an effect on classification or determination of the packing group for the product. In the event of doubt regarding the classification or packing group of a substance, the flash point of the substance must be determined experimentally.

### 2.3.1 DEFINITION AND GENERAL PROVISIONS

2.3.1.1 Class 3 includes the following substances:

- (a) Flammable liquids (see 2.3.1.2 and 2.3.1.3);
- (b) Liquid desensitised explosives (see 2.3.1.4).

2.3.1.2 **Flammable liquids** are liquids, or mixtures of liquids, or liquids containing solids in solution or suspension (for example, paints, varnishes, lacquers, etc., but not including substances otherwise classified on account of their dangerous characteristics) which give off a flammable vapour at temperatures of not more than 60° C, closed-cup test, or not more than 65.6° C, open-cup test, normally referred to as the flash point. This class also includes:

- (a) liquids offered for transport at temperatures at or above their flash point; and
- (b) substances that are transported or offered for transport at elevated temperatures in a liquid state and which give off a flammable vapour at a temperature at or below the maximum transport temperature.

**NOTE:** The results of open-cup tests and of closed-cup tests are not strictly comparable and even individual results by the same test are often variable.

2.3.1.3 Liquids meeting the definition in 2.3.1.2 with a flash point of more than 35° C which do not sustain combustion need not be considered as flammable liquids for the purposes of this Code. Liquids are considered to be unable to sustain combustion for the purposes of this Code (i.e. they do not sustain combustion under defined test conditions) if:

- (a) they have passed a suitable combustibility test (see SUSTAINED COMBUSTIBILITY TEST) prescribed in the Manual of Tests and Criteria, Part III, sub-section 32.5.2; or
- (b) their fire point according to ISO 2592:2000 is greater than 100° C; or
- (c) they are water miscible solutions with a water content of more than 90% by mass.

2.3.1.4 Liquid desensitised explosives are explosive substances which are dissolved or suspended in water or other liquid substances, to form an homogeneous liquid mixture to suppress their explosives properties (see 2.1.3.6.3).

Entries in the Dangerous Goods List for liquid desensitised explosives are UN Nos. 1204, 2059, 3064, 3343, 3357, 3379 and 3555.

## 2.3.2 ASSIGNMENT OF PACKING GROUPS

2.3.2.1 The criteria in 2.3.2.6 are used to determine the hazard grouping of a liquid that presents a hazard due to flammability.

2.3.2.1.1 For liquids whose only hazard is flammability, the packing group for the substance is the hazard grouping shown in 2.3.2.6.

2.3.2.1.2 For a liquid with additional hazard(s), the hazard group determined from 2.3.2.6 and the hazard group based on the severity of the additional hazard(s) must be considered, and the classification and packing group determined in accordance with the provisions in chapter 2.0.

2.3.2.2 Viscous flammable liquids such as paints, enamels, lacquers, varnishes, adhesives and polishes having a flash point of less than 23°C may be placed in packing group III in conformity with the procedures prescribed in the Manual of Tests and Criteria, Part III, sub-section 32.3, provided that:

- (a) The viscosity<sup>1</sup> and flash-point are in accordance with the following table:

**Table 2.3.2.2: Viscosity Table**

| Kinematic viscosity (extrapolated)<br>v (at near-zero shear rate)<br>mm <sup>2</sup> /s at 23 °C | Flow-time t in seconds | Jet diameter (mm) | Flash point, closed-cup (°C) |
|--------------------------------------------------------------------------------------------------|------------------------|-------------------|------------------------------|
| 20 < v ≤ 80                                                                                      | 20 < t ≤ 60            | 4                 | above 17                     |
| 80 < v ≤ 135                                                                                     | 60 < t ≤ 100           | 4                 | above 10                     |
| 135 < v ≤ 220                                                                                    | 20 < t ≤ 32            | 6                 | above 5                      |
| 220 < v ≤ 300                                                                                    | 32 < t ≤ 44            | 6                 | above -1                     |
| 300 < v ≤ 700                                                                                    | 44 < t ≤ 100           | 6                 | above -5                     |
| 700 < v                                                                                          | 100 < t                | 6                 | no limit                     |

- (b) Less than 3% of the clear solvent layer separates in the solvent separation test;
- (c) The mixture or any separated solvent does not meet the criteria for Division 6.1 or Class 8;

<sup>1</sup>Viscosity determination: Where the substance concerned is non-Newtonian, or where a flow cup method of viscosity determination is otherwise unsuitable, a variable shear-rate viscometer shall be used to determine the dynamic viscosity coefficient of the substance, at 23 °C, at a number of shear rates. The values obtained are plotted against shear rate and then extrapolated to zero shear rate. The dynamic viscosity thus obtained, divided by the density, gives the apparent kinematic viscosity at near-zero shear rate.

- (d) The substances are packed in receptacles of not more than 450 litre capacity.

### 2.3.2.3

#### Reserved

### 2.3.2.4

Substances classified as flammable liquids due to their being transported or offered for transport at elevated temperatures are included in packing group III.

### 2.3.2.5

#### Viscous liquids

#### 2.3.2.5.1

Except as provided for in 2.3.2.5.2, viscous liquids which:

have a flash point of 23° C or above and less than or equal to 60 °C; and

- are not toxic or corrosive<sup>1</sup>; and
- contain not more than 20% nitrocellulose provided the nitrocellulose contains not more than 12.6% nitrogen by dry mass; and
- are packed in receptacles of not more than 450L capacity;

are not subject to this Code, if:

- (a) in the solvent separation test (see Manual of Tests and Criteria, Part III, sub-section 32.5.1), the height of the separated layer of solvent is less than 3% of the total height; and
- (b) the flowtime in the viscosity test (see Manual of Tests and Criteria, Part III, sub-section 32.4.3), with a jet diameter of 6 mm is equal to or greater than:
  - (i) 60 seconds; or
  - (ii) 40 seconds if the viscous liquid contains not more than 60% of Class 3 substances.

#### 2.3.2.5.2

Viscous liquids which are also environmentally hazardous, but meet all other criteria in 2.3.2.5.1, are not subject to any other provisions of this Code when they are transported in single or combination packagings containing a net quantity per single or inner packaging of 5 litres or less, provided the packagings meet the general provisions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8.

### 2.3.2.6

Hazard grouping based on flammability

**Table 2.3.2.6: Hazard grouping based on flammability**

| Packing group | Flash point (closed-cup) | Initial boiling point |
|---------------|--------------------------|-----------------------|
| I             | --                       | ≤ 35° C               |
| II            | < 23° C                  | > 35° C               |
| III           | ≥ 23 °C ≤ 60° C          | > 35° C               |

<sup>1</sup> UN23 uses the phrase “or environmentally hazardous” here. However in this Code that would be misleading as environmentally hazardous liquids and solids are not subject to this Code in packagings, IBCs or other receptacles not exceeding 500 kg(L) [see Special Provision AU01].

### 2.3.3

## DETERMINATION OF FLASH POINT

The following methods for determining the flash point of flammable liquids may be used:

### International standards:

|          |          |           |
|----------|----------|-----------|
| ISO 1516 | ISO 1523 | ISO 2719  |
| ISO 3679 | ISO 3680 | ISO 13736 |

### National standards:

Standards Australia, GPO Box 476, Sydney, NSW, 2001:

### 2.3.4

## DETERMINATION OF INITIAL BOILING POINT

The following methods for determining the initial boiling point of flammable liquids may be used:

### International standards:

|          |          |          |
|----------|----------|----------|
| ISO 3405 | ISO 3924 | ISO 4626 |
|----------|----------|----------|

### National standards:

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D86-07a, Standard Test Method for Distillation of Petroleum Products at Atmospheric Pressure

ASTM D1078-05, Standard Test Method for Distillation Range of Volatile Organic Liquids

**Further acceptable methods:**

Method A.2 as described in Part A of the Annex to Commission Regulation (EC) No 440/2008<sup>1</sup>.

### 2.3.5

### SUBSTANCES NOT ACCEPTED FOR TRANSPORT

Chemically unstable substances of Class 3 shall not be accepted for transport unless the necessary precautions have been taken to prevent the possibility of a dangerous decomposition or polymerization under normal conditions of transport. For the precautions necessary to prevent polymerization, see special provision 386 of chapter 3.3. To this end particular care shall be taken to ensure that receptacles and tanks do not contain any substances liable to promote these reactions.

---

<sup>1</sup>Commission Regulation (EC) No 440/2008 of 30 May 2008 laying down test methods pursuant to Regulation (EC) No 1907/2006 of the European Parliament and of the Council on the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) (Official Journal of the European Union, No. L 142 of 31.05.2008, p.1-739 and No. L 143 of 03.06.2008, p.55).

## CHAPTER 2.4: CLASS 4 - FLAMMABLE SOLIDS; SUBSTANCES LIABLE TO SPONTANEOUS COMBUSTION; SUBSTANCES WHICH, IN CONTACT WITH WATER, EMIT FLAMMABLE GASES

### Introductory Notes

**NOTE 1:** Where the term “water reactive” is used in this Code, it refers to a substance which in contact with water emits flammable gas.

**NOTE 2:** Because of the different properties exhibited by dangerous goods within Divisions 4.1 and 4.2, it is impracticable to establish a single criterion for classification in either of these divisions. Tests and criteria for assignment to the three divisions of Class 4 are addressed in this Chapter (and in the Manual of Tests and Criteria, Part III, section 33).

**NOTE 3:** Since organometallic substances can be classified in Divisions 4.2 or 4.3 with additional subsidiary hazards, depending on their properties, a specific classification flow chart for these substances is given in 2.4.5.

### 2.4.1 DEFINITIONS AND GENERAL PROVISIONS

2.4.1.1 Class 4 is divided into three divisions as follows:

- (a) Division 4.1 Flammable solids  
Solids which, under conditions encountered in transport, are readily combustible or may cause or contribute to fire through friction; self-reactive substances and polymerizing substances which are liable to undergo a strongly exothermic reaction; solid desensitised explosives which may explode if not diluted sufficiently;
- (b) Division 4.2 Substances liable to spontaneous combustion  
Substances which are liable to spontaneous heating under normal conditions encountered in transport, or to heating up in contact with air, and being then liable to catch fire;
- (c) Division 4.3 Substances which in contact with water emit flammable gases  
Substances which, by interaction with water, are liable to become spontaneously flammable or to give off flammable gases in dangerous quantities.

2.4.1.2 As referenced in this chapter, test methods and criteria, with advice on application of the tests, are given in the Manual of Tests and Criteria, for the classification of the following types of substances of Class 4:

- (a) Flammable solids (Division 4.1);
- (b) Self-reactive substances (Division 4.1);
- (c) Polymerizing substances (Division 4.1);
- (d) Pyrophoric solids (Division 4.2);
- (e) Pyrophoric liquids (Division 4.2);
- (f) Self heating substances (Division 4.2);
- (g) Substances which, in contact with water, emit flammable gases (Division 4.3).

Test methods and criteria for self-reactive substances and polymerizing substances are given in Part II of the Manual of Tests and Criteria, and

test methods and criteria for the other types of substances of Class 4 are given in the Manual of Tests and Criteria, Part III, section 33.

## **2.4.2 DIVISION 4.1 - FLAMMABLE SOLIDS, SELF-REACTIVE SUBSTANCES, SOLID DESENSITISED EXPLOSIVES AND POLYMERIZING SUBSTANCES**

### **2.4.2.1 General**

Division 4.1 includes the following types of substances:

- (a) Flammable solids (see 2.4.2.2);
- (b) Self reactive substances (see 2.4.2.3);
- (c) Solid desensitised explosives (see 2.4.2.4); and
- (d) Polymerizing substances (see 2.4.2.5).

### **2.4.2.2 Division 4.1 Flammable solids**

#### **2.4.2.2.1 Definitions and properties**

2.4.2.2.1.1 Flammable solids are readily combustible solids and solids which may cause fire through friction.

2.4.2.2.1.2 Readily combustible solids are powdered, granular, or pasty substances which are dangerous if they can be easily ignited by brief contact with an ignition source, such as a burning match, and if the flame spreads rapidly. The danger may come not only from the fire but also from toxic combustion products. Metal powders are especially dangerous because of the difficulty of extinguishing a fire since normal extinguishing agents such as carbon dioxide or water can increase the hazard.

2.4.2.2.1.3 Metal powders are powders of metals or metal alloys.

#### **2.4.2.2.2 Classification of flammable solids**

2.4.2.2.2.1 Powdered, granular or pasty substances must be classified as readily combustible solids of Division 4.1 when the time of burning of one or more of the test runs, performed in accordance with the test method described in the Manual of Tests and Criteria, Part III, sub-section 33.2, is less than 45 s or the rate of burning is more than 2.2 mm/s. Metal powders must be classified in Division 4.1 when they can be ignited and the reaction spreads over the whole length of the sample in 10 minutes or less.

2.4.2.2.2.2 Solids which may cause fire through friction must be classified in Division 4.1 by analogy with existing entries (e.g. matches) until definitive criteria are established.

### 2.4.2.2.3

### Assignment of packing groups

#### 2.4.2.2.3.1

Packing groups are assigned on the basis of the test methods referred to in 2.4.2.2.2.1. For readily combustible solids (other than metal powders), packing group II must be assigned if the burning time is less than 45 s and the flame passes the wetted zone. Packing group II must be assigned to metal powders if the zone of reaction spreads over the whole length of the sample in five minutes or less.

#### 2.4.2.2.3.2

Packing groups are assigned on the basis of the test methods referred to in 2.4.2.2.2.1. For readily combustible solids (other than metal powders), packing group III must be assigned if the burning time is less than 45 s and the wetted zone stops the flame propagation for at least four minutes. Packing group III must be assigned to metal powders if the reaction spreads over the whole length of the sample in more than five minutes but not more than ten minutes.

#### 2.4.2.2.3.3

For solids which may cause fire through friction, the packing group must be assigned by analogy with existing entries or in accordance with any appropriate special provision.

### 2.4.2.3

### Division 4.1 Self-reactive substances

#### 2.4.2.3.1

Definitions and properties

##### 2.4.2.3.1.1

Definitions

For the purposes of this Code:

**Self-reactive substances** are thermally unstable substances liable to undergo a strongly exothermic decomposition even without participation of oxygen (air). Substances are not considered to be self reactive substances of Division 4.1, if:

- (a) they are explosives according to the criteria of Class 1;
- (b) they are oxidising substances according to the classification procedure for Division 5.1 (see 2.5.2.1.1) except that mixtures of oxidising substances which contain 5.0% or more of combustible organic substances must be subjected to the classification procedure defined in Note 3;
- (c) they are organic peroxides according to the criteria of Division 5.2;
- (d) their heat of decomposition is less than 300 J/g; or
- (e) their self-accelerating decomposition temperature (SADT) (see 2.4.2.3.4) is greater than 75 °C for a 50 kg package.

**NOTE 1:** The heat of decomposition can be determined using any internationally recognised method e.g. differential scanning calorimetry and adiabatic calorimetry.

**NOTE 2:** Any substance which shows the properties of a self-reactive substance must be classified as such, even if this substance gives a positive test result according to 2.4.3.2 for inclusion in Division 4.2.

**NOTE 3:** Mixtures of oxidising substances meeting the criteria of Division 5.1 which contain 5.0% or more of combustible organic substances, which do not meet the criteria mentioned in (a), (c), (d) or (e)

*above, must be subjected to the self-reactive substance classification procedure.*

*A mixture showing the properties of a self-reactive substance, type B to F, must be classified as a self-reactive substance of Division 4.1.*

*A mixture showing the properties of a self-reactive substance, type G, according to the principle of 2.4.2.3.3.2 (g) must be considered for classification as a substance of Division 5.1 (see 2.5.2.1.1).*

#### 2.4.2.3.1.2

##### Properties

The decomposition of self reactive substances can be initiated by heat, contact with catalytic impurities (e.g. acids, heavy metal compounds, bases), friction or impact. The rate of decomposition increases with temperature and varies with the substance.

Decomposition, particularly if no ignition occurs, may result in the evolution of toxic gases or vapours. For certain self-reactive substances, the temperature must be controlled. Some self-reactive substances may decompose explosively, particularly if confined. This characteristic may be modified by the addition of diluents or by the use of appropriate packagings. Some self-reactive substances burn vigorously. Self-reactive substances are, for example, some compounds of the types listed below:

- (a) Aliphatic azo compounds (-C-N=N-C-);
- (b) Organic azides (-C-N<sub>3</sub>); and
- (c) Diazonium salts (-CN<sub>2</sub><sup>+</sup>Z-); and
- (d) N-nitroso compounds (-N-N=O); and
- (e) Aromatic sulphonylhydrazides (-SO<sub>2</sub>-NH-NH<sub>2</sub>).

This list is not exhaustive and substances with other reactive groups and some mixtures of substances may have similar properties.

#### 2.4.2.3.2

##### Classification of self-reactive substances

#### 2.4.2.3.2.1

Self-reactive substances are classified into seven types according to the degree of danger they present. The types of self reactive substance range from type A, which may not be accepted for transport in the packaging in which it is tested, to type G, which is not subject to the provisions for self-reactive substances of Division 4.1. The classification of types B to F is directly related to the maximum quantity allowed in one packaging.

#### 2.4.2.3.2.2

Self-reactive substances permitted for transport in packagings are listed in 2.4.2.3.2.3, those permitted for transport in IBCs are listed in packing instruction IBC520 and those permitted for transport in portable tanks are listed in portable tank instruction T23. For each permitted substance listed, the appropriate generic entry of the Dangerous Goods List (UN Nos. 3221 to 3240) is assigned, and appropriate subsidiary hazards and remarks providing relevant transport information are given. The generic entries specify:

- (a) self-reactive substance type (B to F);
- (b) physical state (liquid or solid); and
- (c) temperature control, when required (see 2.4.2.3.4).

## 2.4.2.3.2.3

## List of currently assigned self-reactive substances in packagings

In the column "Packing Method", codes "OP1" to "OP8" refer to packing methods in packing instruction P520. Self-reactive substances to be transported must fulfil the classification and the control and emergency temperatures (derived from the SADT) as listed. For substances permitted in IBCs, see packing instruction IBC520, and for those permitted in tanks, see portable tank instruction T23. The formulations not listed in this sub-section but listed in packing instruction IBC520 of 4.1.4.2 and in portable tank instruction T23 of 4.2.5.2.6 may also be transported packed in accordance with packing method OP8 of packing instruction P520 of 4.1.4.1, with the same control and emergency temperatures, if applicable.

**NOTE:** The classification given in the following table is based on the technically pure substance (except where a concentration of less than 100% is specified). For other concentrations, the substances may be classified differently following the procedures in 2.4.2.3.3 and 2.4.2.3.4.

Table 2.4.2.3.2.3: Assigned self-reactive substances in packagings

| SELF-REACTIVE SUBSTANCE                                             | Con-<br>centration<br>(%) | Pack-<br>ing<br>metho-<br>d | Temperature (°C) |                | UN<br>gen-<br>eric<br>entry | Remark-<br>s |

#### Remarks

- (1) Azodicarbonamide formulations which fulfil the criteria of 2.4.2.3.3.2 (b). The control and emergency temperatures must be determined by the procedure given in 7.1.5.3 to 7.1.5.3.6.
- (2) "EXPLOSIVE" subsidiary hazard label (Model No.1, see 5.2.2.2.2) required.
- (3) Azodicarbonamide formulations which fulfil the criteria of 2.4.2.3.3.2 (c).
- (4) Azodicarbonamide formulations which fulfil the criteria of 2.4.2.3.3.2 (c). The control and emergency temperatures must be determined by the procedure given in 7.1.5.3 to 7.1.5.3.6.
- (5) Azodicarbonamide formulations which fulfil the criteria of 2.4.2.3.3.2 (d).
- (6) Azodicarbonamide formulations which fulfil the criteria of 2.4.2.3.3.2 (d). The control and emergency temperatures must be determined by the procedure given in 7.1.5.3 to 7.1.5.3.6.

| SELF-REACTIVE SUBSTANCE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Con-<br>centration<br>(%) | Pack-<br>ing<br>metho-<br>d | Temperature (°C) |                | UN<br>gen-<br>eric<br>entry | Remark-<br>s |

#### 2.4.2.3.2.4

Classification of self-reactive substances not listed in 2.4.2.3.2.3, packing instruction IBC520 or portable tank instruction T23 and assignment to a generic entry must be made by the competent authority of the country or jurisdiction of origin on the basis of a test report. Principles applying to the classification of such substances are provided in 2.4.2.3.3. The applicable classification procedures, test methods and criteria, and an example of a suitable test report, are given in the Manual of Tests and Criteria, Part II. The determination must contain the classification and the relevant transport conditions.

- (a) Activators, such as zinc compounds, may be added to some self reactive substances to change their reactivity. Depending on both the type and the concentration of the activator, this may result in a decrease in thermal stability and a change in explosive properties. If either of these properties is altered, the new formulation must be assessed in accordance with this classification procedure;
- (b) Samples of self-reactive substances or formulations of self-reactive substances not listed in 2.4.2.3.2.3, for which a complete set of test results is not available and which are to be transported for further testing or evaluation, may be assigned to one of the appropriate entries for self-reactive substances type C provided the following conditions are met:
  - (i) the available data indicate that the sample would be no more dangerous than self reactive substances type B;
  - (ii) the sample is packaged in accordance with packing method OP2 (see applicable packing instruction) and the quantity per cargo transport unit is limited to 10 kg; and
  - (iii) the available data indicate that the control temperature, if any, is sufficiently low to prevent any dangerous decomposition and sufficiently high to prevent any dangerous phase separation.

#### 2.4.2.3.3

Principles for classification of self-reactive substances

**NOTE:** This section refers only to those properties of self-reactive substances which are decisive for their classification. A flow chart,

*presenting the classification principles in the form of a graphically arranged scheme of questions concerning the decisive properties together with the possible answers, is given in Figure 2.4.1. These properties must be determined experimentally using the test methods and criteria given in the Manual of Tests and Criteria, Part II.*

2.4.2.3.3.1

A self reactive substance is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.

2.4.2.3.3.2

The following principles apply to the classification of self-reactive substances not listed in 2.4.2.3.2.3.

- (a) Any substance which can detonate or deflagrate rapidly, as packaged for transport, is prohibited from transport under the provisions for self-reactive substances of Division 4.1 in that packaging (defined as self-reactive substance type A, exit box A of Figure 2.4.1);
- (b) Any substance possessing explosive properties and which, as packaged for transport, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package, must also bear an “EXPLOSIVE” subsidiary hazard label (Model No.1, see 5.2.2.2.2). Such a substance may be packaged in amounts of up to 25 kg unless the maximum quantity has to be limited to a lower amount to preclude detonation or rapid deflagration in the package (defined as self-reactive substance type B, exit box B of Figure 2.4.1);
- (c) Any substance possessing explosive properties may be transported without an “EXPLOSIVE” subsidiary hazard label when the substance as packaged (maximum 50 kg) for transport cannot detonate or deflagrate rapidly or undergo a thermal explosion (defined as self-reactive substance type C, exit box C of Figure 2.4.1);
- (d) Any substance which in laboratory testing:
  - (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or
  - (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or
  - (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement,may be accepted for transport in packages of not more than 50 kg net mass (defined as self-reactive substance type D, exit box D of Figure 2.4.1);
- (e) Any substance which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement may be accepted for transport in packages of not more than 400 kg/450 litres (defined as self-reactive substance type E, exit box E of Figure 2.4.1);
- (f) Any substance which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no

- explosive power may be considered for transport in IBCs or tanks (defined as self-reactive substance type F, exit box F of Figure 2.4.1); (for additional provisions see 4.1.7.2.2 and 4.2.1.13);
- (g) Any substance which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power is exempted from classification as a self-reactive substance of Division 4.1 provided that the formulation is thermally stable (self-accelerating decomposition temperature 60 °C to 75 °C for a 50 kg package) and any diluent meets the requirements of 2.4.2.3.5 (defined as self-reactive substance type G, exit box G of Figure 2.4.1). If the formulation is not thermally stable or a compatible diluent having a boiling point less than 150 °C is used for desensitisation, the formulation must be defined as SELF REACTIVE LIQUID/SOLID TYPE F.

**Figure 2.4.1: Flow chart scheme for self-reactive substances**

#### 2.4.2.3.4

#### Temperature control requirements

Self-reactive substances are subject to temperature control in transport if their self-accelerating decomposition temperature (SADT) is less than or equal to 55 °C. Test methods for determining the SADT are given in the Manual of Tests and Criteria, Part II, section 28. The test selected must be conducted in a manner which is representative, both in size and material, of the package to be transported.

- 2.4.2.3.5 Desensitisation of self-reactive substances
- 2.4.2.3.5.1 In order to ensure safety during transport, self-reactive substances may be desensitised through the use of a diluent. If a diluent is used, the self-reactive substance must be tested with the diluent present in the concentration and form used in transport.
- 2.4.2.3.5.2 Diluents which may allow a self-reactive substance to concentrate to a dangerous extent in the event of leakage from a package must not be used.
- 2.4.2.3.5.3 The diluent must be compatible with the self-reactive substance. In this regard, compatible diluents are those solids or liquids which have no detrimental influence on the thermal stability and hazard type of the self-reactive substance.
- 2.4.2.3.5.4 Liquid diluents in liquid formulations requiring temperature control must have a boiling point of at least 60 °C and a flash point not less than 5 °C. The boiling point of the liquid must be at least 50 °C higher than the control temperature of the self-reactive substance (see 7.1.5.3).

## 2.4.2.4 Division 4.1 Solid desensitised explosives

### 2.4.2.4.1 Definition

**Solid desensitised explosives** are explosive substances which are wetted with water or alcohols or are diluted with other substances, to form a homogeneous solid mixture to suppress their explosive properties (see 2.1.3.6.3).

Entries in the Dangerous Goods List for solid desensitised explosives are:

|         |         |         |         |         |         |         |
|---------|---------|---------|---------|---------|---------|---------|
| UN 1310 | UN 1320 | UN 1321 | UN 1322 | UN 1336 | UN 1337 | UN 1344 |
| UN 1347 | UN 1348 | UN 1349 | UN 1354 | UN 1355 | UN 1356 | UN 1357 |
| UN 1517 | UN 1571 | UN 2555 | UN 2556 | UN 2557 | UN 2852 | UN 2907 |
| UN 3317 | UN 3319 | UN 3344 | UN 3364 | UN 3365 | UN 3366 | UN 3367 |
| UN 3368 | UN 3369 | UN 3370 | UN 3376 | UN 3380 | UN 3474 |         |

### 2.4.2.4.2

Substances that:

- (a) have been provisionally accepted into Class 1 according to test series 1 and 2 but exempted from Class 1 by test series 6;
- (b) are not self-reactive substances of Division 4.1;
- (c) are not substances of Class 5;

are also assigned to Division 4.1. Though not desensitised explosives, UN 2956, UN 3241, UN 3242 and UN 3251 are such entries that are assigned to Division 4.1.

## 2.4.2.5 Division 4.1 Polymerizing substances and mixtures (stabilized)

### 2.4.2.5.1 Definitions and properties

**Polymerizing substances** are substances which, without stabilization, are liable to undergo a strongly exothermic reaction resulting in the formation of larger molecules or resulting in the formation of polymers under conditions normally encountered in transport. Such substances are considered to be polymerizing substances of Division 4.1 when:

- (a) Their self-accelerating polymerization temperature (SAPT) is 75 °C or less under the conditions (with or without chemical stabilization as offered for transport) and in the packaging, IBC or portable tank in which the substance or mixture is to be transported;
- (b) They exhibit a heat of reaction of more than 300 J/g; and
- (c) They do not meet any other criteria for inclusion in Classes 1-8.

A mixture meeting the criteria of a polymerizing substance shall be classified as a polymerizing substance of Division 4.1.

2.4.2.5.2

Polymerizing substances are subject to temperature control in transport if their self-accelerating polymerization temperature (SAPT) is:

- (a) When offered for transport in a packaging or IBC, 50 °C or less in the packaging or IBC in which the substance is to be transported; or
- (b) When offered for transport in a portable tank, 45 °C or less in the portable tank in which the substance is to be transported

**NOTE:** *Substances meeting the criteria of a polymerizing substance and also for inclusion in Classes 1 to 8 are subject to the requirements of special provision 386 of chapter 3.3.*

2.4.3

## **DIVISION 4.2 - SUBSTANCES LIABLE TO SPONTANEOUS COMBUSTION**

2.4.3.1

### **Definitions and properties**

2.4.3.1.1

Division 4.2 includes:

- (a) Pyrophoric substances, which are substances, including mixtures and solutions (liquid or solid), which even in small quantities ignite within five minutes of coming in contact with air. These are the Division 4.2 substances most liable to spontaneous combustion; and
- (b) Self-heating substances, which are substances, other than pyrophoric substances, which in contact with air without energy supply are liable to self heating. These substances will ignite only when in large amounts (kilograms) and after long periods of time (hours or days).

2.4.3.1.2

Self-heating of a substance is a process where the gradual reaction of that substance with oxygen (in air) generates heat. If the rate of heat production exceeds the rate of heat loss, then the temperature of the substance will rise which, after an induction time, may lead to self-ignition and combustion.

## 2.4.3.2

## Classification in Division 4.2

### 2.4.3.2.1

Solids are considered pyrophoric solids which must be classified in Division 4.2 if, in tests performed in accordance with the test method given in the Manual of Tests and Criteria, Part III, sub-section 33.4.4 the sample ignites in one of the tests.

### 2.4.3.2.2

Liquids are considered pyrophoric liquids which must be classified in Division 4.2 if, in tests performed in accordance with the test method given in the Manual of Tests and Criteria, Part III, sub-section 33.4.5 the liquid ignites in the first part of the test, or if it ignites or chars the filter paper.

### 2.4.3.2.3

Self-heating substances

#### 2.4.3.2.3.1

A substance must be classified as a self-heating substance of Division 4.2 if, in tests performed in accordance with the test method given in the Manual of Tests and Criteria, Part III, sub-section 33.4.6:

- (a) a positive result is obtained using a 25 mm cube sample at 140 °C;
- (b) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 100 mm cube sample at 120 °C and the substance is to be transported in packages with a volume of more than 3 m<sup>3</sup>;
- (c) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 100 mm cube sample at 100 °C and the substance is to be transported in packages with a volume of more than 450 litres;
- (d) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a positive result is obtained using a 100 mm cube sample at 100 °C.

**NOTE:** Self-reactive substances giving also a positive result with this test method, must not be classified in Division 4.2 but in Division 4.1 (see 2.4.2.3.1.1).

#### 2.4.3.2.3.2

A substance should not be classified in Division 4.2 if:

- (a) a negative result is obtained in a test using a 100 mm cube sample at 140 °C;
- (b) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 25 mm cube sample at 140 °C, a negative result is obtained in a test using a 100 mm cube sample at 120 °C and the substance is to be transported in packages with a volume not more than 3 m<sup>3</sup>;
- (c) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 25 mm cube sample at 140 °C, a negative result is obtained in a test using a 100 mm cube sample at 100 °C and the substance is to be transported in packages with a volume not more than 450 litres.

## 2.4.3.3

## Assignment of packing groups

### 2.4.3.3.1

Packing group I must be assigned to all pyrophoric solids and liquids.

- 2.4.3.3.2 Packing group II must be assigned to self-heating substances which give a positive result in a test using a 25 mm sample cube at 140 °C.
- 2.4.3.3.3 Packing group III must be assigned to self-heating substances if:
- (a) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 25 mm cube sample at 140 °C and the substance is to be transported in packages with a volume of more than 3 m<sup>3</sup>;
  - (b) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 25 mm cube sample at 140 °C, a positive result is obtained in a test using a 100 mm cube sample at 120 °C and the substance is to be transported in packages with a volume of more than 450 litres;
  - (c) a positive result is obtained in a test using a 100 mm sample cube at 140 °C and a negative result is obtained in a test using a 25 mm cube sample at 140 °C and a positive result is obtained in a test using a 100 mm cube sample at 100 °C.

## **2.4.4 DIVISION 4.3 - SUBSTANCES WHICH IN CONTACT WITH WATER EMIT FLAMMABLE GASES**

### **2.4.4.1 Definitions and properties**

Certain substances in contact with water may emit flammable gases that can form explosive mixtures with air. Such mixtures are easily ignited by all ordinary sources of ignition, for example naked lights, sparking handtools or unprotected lamps. The resulting blast wave and flames may endanger people and the environment. The test method referred to in 2.4.4.2 is used to determine whether the reaction of a substance with water leads to the development of a dangerous amount of gases which may be flammable. This test method should not be applied to pyrophoric substances.

### **2.4.4.2 Classification in Division 4.3**

Substances which in contact with water emit flammable gases must be classified in Division 4.3 if, in tests performed in accordance with the test method given in the Manual of Tests and Criteria, Part III, sub-section 33.5:

- (a) spontaneous ignition takes place in any step of the test procedure; or
- (b) there is an evolution of a flammable gas at a rate greater than 1 litre per kilogram of the substance per hour.

### **2.4.4.3 Assignment of packing groups**

- 2.4.4.3.1 Packing group I must be assigned to any substance which reacts vigorously with water at ambient temperatures and demonstrates generally a tendency for the gas produced to ignite spontaneously, or which reacts readily with water at ambient temperatures such that the rate of evolution of flammable gas is equal to or greater than 10 litres per kilogram of substance over any one minute.

2.4.4.3.2 Packing group II must be assigned to any substance which reacts readily with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 20 litres per kilogram of substance per hour, and which does not meet the criteria for packing group I.

2.4.4.3.3 Packing group III must be assigned to any substance which reacts slowly with water at ambient temperatures such that the maximum rate of evolution of flammable gas is greater than 1 litre per kilogram of substance per hour, and which does not meet the criteria for packing groups I or II.

## **2.4.5 CLASSIFICATION OF ORGANOMETALLIC SUBSTANCES**

Depending on their properties, organometallic substances may be classified in Divisions 4.2 or 4.3, as appropriate, in accordance with the flow-chart scheme given in figure 2.4.2.

**Figure 2.4.2: Flowchart scheme for organometallic substances**

**Notes:**

\* Test methods N.1 to N.5 can be found in the Manual of tests and Criteria, part III, Section 33.

† If applicable and testing is relevant, taking into account reactivity properties, Class 6.1 and 8 properties should be considered according to the precedence of hazard table 2.0.3.3.

## CHAPTER 2.5: CLASS 5 - OXIDISING SUBSTANCES AND ORGANIC PEROXIDES

### Introductory Note

**NOTE:** Because of the different properties exhibited by dangerous goods within Divisions 5.1 and 5.2, it is impracticable to establish a single criterion for classification in either division. Tests and criteria for assignment to the two divisions of Class 5 are addressed in this Chapter.

#### 2.5.1

#### DEFINITIONS AND GENERAL PROVISIONS

Class 5 is divided into two divisions as follows:

(a) Division 5.1 Oxidising substances

Substances which, while in themselves not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material. Such substances may be contained in an article;

(b) Division 5.2 Organic peroxides

Organic substances which contain the bivalent -O-O- structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. Organic peroxides are thermally unstable substances, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties:

- (i) be liable to explosive decomposition;
- (ii) burn rapidly;
- (iii) be sensitive to impact or friction;
- (iv) react dangerously with other substances;
- (v) cause damage to the eyes.

#### 2.5.2

#### DIVISION 5.1 - OXIDISING SUBSTANCES

##### 2.5.2.1

##### Classification in Division 5.1

###### 2.5.2.1.1

Oxidising substances are classified in Division 5.1 in accordance with the test methods, procedures and criteria in 2.5.2.2, 2.5.2.3 and the Manual of Tests and Criteria, Part III, section 34. In the event of divergence between test results and known experience, judgement based on known experience must take precedence over test results.

**NOTE:** Where substances of this Division are listed in the Dangerous Goods List in chapter 3.2, reclassification of those substances in accordance with this criteria should be undertaken only when this is necessary for safety.

###### 2.5.2.1.2

By exception, solid ammonium nitrate based fertilizers shall be classified in accordance with the procedure as set out in the Manual of Tests and Criteria, Part III, Section 39

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 2.5.2.1.3      | For substances having other hazards, e.g. toxicity or corrosivity, the requirements of chapter 2.0 must be met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>2.5.2.2</b> | <b>Oxidising solids</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2.5.2.2.1      | Criteria for classification in Division 5.1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2.5.2.2.1.1    | <p>Tests are performed to measure the potential for the solid substance to increase the burning rate or burning intensity of a combustible substance when the two are thoroughly mixed. The procedure is given in the Manual of Tests and Criteria, Part III, sub-section 34.4.1 (test O.1) or alternatively, in sub-section 34.4.3 (test O.3). Tests are conducted on the substance to be evaluated mixed with dry fibrous cellulose in mixing ratios of 1:1 and 4:1, by mass, of sample to cellulose. The burning characteristics of the mixtures are compared:</p> <ul style="list-style-type: none"> <li>(a) In the test O.1, with the standard 3:7 mixture, by mass, of potassium bromate to cellulose. If the burning time is equal to or less than this standard mixture, the burning times must be compared with those from the packing group I or II reference standards, 3:2 and 2:3 ratios, by mass, of potassium bromate to cellulose respectively; or</li> <li>(b) In the test O.3, with the standard 1:2 mixture, by mass, of calcium peroxide to cellulose. If the burning rate is equal to or greater than this standard mixture, the burning rates must be compared with those from the packing group I or II reference standards 3:1 and 1:1 ratios, by mass, of calcium peroxide to cellulose, respectively.</li> </ul> |
| 2.5.2.2.1.2    | <p>The classification test results are assessed on the basis of:</p> <ul style="list-style-type: none"> <li>(a) The comparison of the mean burning time (for the test O.1) or burning rate (for the test O.3) with those of the reference mixtures; and</li> <li>(b) Whether the mixture of substance and cellulose ignites and burns.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2.5.2.2.1.3    | <p>A solid substance is classified in Division 5.1 if the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits:</p> <ul style="list-style-type: none"> <li>(a) In the test O.1, a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose; or</li> <li>(b) In the test O.3, a mean burning rate equal to or greater than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

- burning time equal to or less than the mean burning time of a 2:3 mixture (by mass) of potassium bromate and cellulose and the criteria for packing group I are not met;
- (iii) Packing group III: any substance which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose and the criteria for packing groups I and II are not met;
  - (iv) Not Division 5.1: any substance which, in both the 4:1 and 1:1 sample-to-cellulose ratio (by mass) tested, does not ignite and burn, or exhibits mean burning times greater than that of a 3:7 mixture (by mass) of potassium bromate and cellulose.
- (b) Test O.3:
- (i) Packing group I: any substance which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose;
  - (ii) Packing group II: any substance which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:1 mixture (by mass) of calcium peroxide and cellulose and the criteria for packing group I are not met;
  - (iii) Packing group III: any substance which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose and the criteria for packing groups I and II are not met;
  - (iv) Not Division 5.1: any substance which, in both the 4:1 and 1:1 sample-to-cellulose ratio (by mass) tested, does not ignite and burn, or exhibits a mean burning rate less than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose.

## 2.5.2.3

## Oxidising liquids

### 2.5.2.3.1

Criteria for classification in Division 5.1

#### 2.5.2.3.1.1

A test is performed to determine the potential for a liquid substance to increase the burning rate or burning intensity of a combustible substance or for spontaneous ignition to occur when the two are thoroughly mixed. The procedure is given in the Manual of Tests and Criteria, Part III, sub-section 34.4.2 (Test O.2). It measures the pressure rise time during combustion. Whether a liquid is an oxidising substance of Division 5.1 and, if so, whether packing groups I, II or III must be assigned, is decided on the basis of the test result (see also precedence of hazards characteristics in 2.0.3).

#### 2.5.2.3.1.2

The classification test results are assessed on the basis of:

- (a) whether the mixture of substance and cellulose spontaneously ignites;

- (b) the comparison of the mean time taken for the pressure to rise from 690 kPa to 2070 kPa gauge with those of the reference substances.

#### 2.5.2.3.1.3

A liquid substance is classified in Division 5.1 if the 1:1 mixture, by mass, of substance and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture, by mass, of 65% aqueous nitric acid and cellulose.

#### 2.5.2.3.2

##### Assignment of packing groups

Liquid oxidising substances are assigned to a packing group according to the test procedure in the Manual of Tests and Criteria, Part III, section 34.4.2, in accordance with the following criteria:

- (a) Packing group I: any substance which, in the 1:1 mixture, by mass, of substance and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture, by mass, of substance and cellulose is less than that of a 1:1 mixture, by mass, of 50% perchloric acid and cellulose;
- (b) Packing group II: any substance which, in the 1:1 mixture, by mass, of substance and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture, by mass, of 40% aqueous sodium chlorate solution and cellulose; and the criteria for packing group I are not met;
- (c) Packing group III: any substance which, in the 1:1 mixture, by mass, of substance and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture, by mass, of 65% aqueous nitric acid and cellulose; and the criteria for packing groups I and II are not met;
- (d) Not Division 5.1: any substance which, in the 1:1 mixture, by mass, of substance and cellulose tested, exhibits a pressure rise of less than 2070 kPa gauge; or exhibits a mean pressure rise time greater than the mean pressure rise time of a 1:1 mixture, by mass, of 65% aqueous nitric acid and cellulose.

### 2.5.3

## **DIVISION 5.2 - ORGANIC PEROXIDES**

#### 2.5.3.1

### **Properties**

##### 2.5.3.1.1

Organic peroxides are liable to exothermic decomposition at normal or elevated temperatures. The decomposition can be initiated by heat, contact with impurities (e.g. acids, heavy-metal compounds, amines), friction or impact. The rate of decomposition increases with temperature and varies with the organic peroxide formulation. Decomposition may result in the evolution of harmful, or flammable, gases or vapours. For certain organic peroxides the temperature must be controlled during transport. Some organic peroxides may decompose explosively, particularly if confined. This characteristic may be modified by the addition of diluents or by the use of appropriate packagings. Many organic peroxides burn vigorously.

##### 2.5.3.1.2

Contact of organic peroxides with the eyes is to be avoided. Some organic peroxides will cause serious injury to the cornea, even after brief contact, or will be corrosive to the skin.

## 2.5.3.2

### Classification of organic peroxides

#### 2.5.3.2.1

Any organic peroxide must be considered for classification in Division 5.2, unless the organic peroxide formulation contains:

- (a) not more than 1.0% available oxygen from the organic peroxides when containing not more than 1.0% hydrogen peroxide; or
- (b) not more than 0.5% available oxygen from the organic peroxides when containing more than 1.0% but not more than 7.0% hydrogen peroxide.

**NOTE:** The available oxygen content (%) of an organic peroxide formulation is given by the formula:

$$16 \times \sum (n_i \times c_i / m_i)$$

where:

$n_i$  = number of peroxygen groups per molecule of organic peroxide  $i$ ;

$c_i$  = concentration (mass %) of organic peroxide  $i$ ;

$m_i$  = molecular mass of organic peroxide  $i$ .

#### 2.5.3.2.2

Organic peroxides are classified into seven types according to the degree of danger they present. The types of organic peroxide range from type A, which may not be accepted for transport in the packaging in which it is tested, to type G, which is not subject to the provisions for organic peroxides of Division 5.2. The classification of types B to F is directly related to the maximum quantity allowed in one packaging.

#### 2.5.3.2.3

Organic peroxides permitted for transport in packagings are listed in 2.5.3.2.4, those permitted for transport in IBCs are listed in packing instruction IBC520 and those permitted for transport in portable tanks are listed in portable tank instruction T23. For each permitted substance listed, the generic entry of the Dangerous Goods List (UN Nos. 3101 to 3120) is assigned, appropriate subsidiary hazards and remarks providing relevant transport information are given.

The generic entries specify:

- (a) organic peroxide type (B to F);
- (b) physical state (liquid or solid); and
- (c) temperature control, when required (see 2.5.3.4).

#### 2.5.3.2.3.1

Mixtures of the listed formulations may be classified as the same type of organic peroxide as that of the most dangerous component and be transported under the conditions of transport given for this type. However, as two stable components can form a thermally less stable mixture, the self-accelerating decomposition temperature (SADT) of the mixture must be determined and, if necessary, temperature control applied as required by 2.5.3.4.

#### 2.5.3.2.4

List of currently assigned organic peroxides in packagings

“Packing Method” codes “OP1” to “OP8” refer to packing methods in packing instruction P520. Peroxides to be transported should fulfill the classification and the control and emergency temperatures (derived from the SADT) as listed. For substances permitted in IBCs see packing

instruction IBC520, and for those permitted in tanks, see portable tank instruction T23. The formulations not listed in this sub-section but listed in packing instruction IBC520 of 4.1.4.2 and in portable tank instruction T23 of 4.2.5.2.6 may also be transported packed in accordance with packing method OP8 of packing instruction P520 of 4.1.4.1, with the same control and emergency temperatures, if applicable.

Notes on 2.5.3.2.4:

- 1) Diluent type B may always be replaced by diluent type A. The boiling point of diluent type B should be at least 60 °C higher than the SADT of the organic peroxide.
- 2) Available oxygen ≤ 4.7 %.
- 3) “EXPLOSIVE” subsidiary hazard label required (Model No.1, see 5.2.2.2.2).
- 4) Diluent may be replaced by di-tert-butyl peroxide.
- 5) Available oxygen ≤ 9 %.
- 6) With ≤ 9 % hydrogen peroxide; available oxygen ≤ 10 %.
- 7) Only non-metallic packagings allowed.
- 8) Available oxygen > 10 % and ≤ 10.7 %, with or without water.
- 9) Available oxygen ≤ 10 %, with or without water.
- 10) Available oxygen ≤ 8.2 %, with or without water.
- 11) See 2.5.3.2.5.1.
- 12) Up to 2 000 kg per receptacle assigned to ORGANIC PEROXIDE TYPE F on the basis of large scale trials.
- 13) “CORROSIVE” subsidiary hazard label required (Model No 8, see 5.2.2.2.2).
- 14) Peroxyacetic acid formulations which fulfil the criteria of 2.5.3.3.2 (d).

- 15) Peroxyacetic acid formulations which fulfil the criteria of 2.5.3.3.2 (e).
- 16) Peroxyacetic acid formulations which fulfil the criteria of 2.5.3.3.2 (f).
- 17) Addition of water to this organic peroxide will decrease its thermal stability.
- 18) No "CORROSIVE" subsidiary hazard label required for concentrations below 80 %.
- 19) Mixtures with hydrogen peroxide, water and acid(s).
- 20) With diluent type A, with or without water.
- 21) With  $\geq 25$  % diluent type A by mass, and in addition ethylbenzene.
- 22) With  $\geq 19$  % diluent type A by mass, and in addition methyl isobutyl ketone.
- 23) With  $< 6$  % di-tert-butyl peroxide.
- 24) With  $\leq 8$  % 1-isopropylhydroperoxy-4-isopropylhydroxybenzene.
- 25) Diluent type B with boiling point  $> 110$  °C.
- 26) With  $< 0.5$  % hydroperoxides content.
- 27) For concentrations more than 56 %, "CORROSIVE" subsidiary hazard label (Model No 8, see 5.2.2.2.2) required.
- 28) Available active oxygen  $\leq 7.6$  % in diluent Type A having a 95 % boil-off point in the range of 200 - 260 °C.
- 29) Not subject to the requirements of these Model Regulations for Division 5.2.
- 30) Diluent type B with boiling point  $> 130$  °C.
- 31) Active oxygen  $\leq 6.7$  %.
- 32) Active oxygen  $\leq 4.15$  %
- 33) Available oxygen  $\leq 10\%$ .
- 34) Sum of diluent type A and water  $\geq 55$  %, and in addition methyl ethyl ketone.

2.5.3.2.5 Classification of organic peroxides not listed in 2.5.3.2.4, packing instruction IBC520 or portable tank instruction T23 and assignment to a generic entry must be made by the competent authority of the country or jurisdiction of origin on the basis of a test report. Principles applying to the classification of such substances are provided in 2.5.3.3. The applicable classification procedures, test methods and criteria, and an example of a suitable test report, are given in the current edition of the Manual of Tests and Criteria, Part II. The determination must contain the classification and the relevant transport conditions.

2.5.3.2.5.1 Samples of new organic peroxides or new formulations of organic peroxides not listed in 2.5.3.2.4, for which complete test data are not available and which are to be transported for further testing or evaluation, may be assigned to one of the appropriate entries for ORGANIC PEROXIDE TYPE C provided the following conditions are met:

- (a) The available data indicate that the sample would be no more dangerous than ORGANIC PEROXIDE TYPE B;
- (b) The sample is packaged in accordance with packing method OP2 (see applicable packing instruction) and the quantity per cargo transport unit is limited to 10 kg;
- (c) The available data indicate that the control temperature, if any, is sufficiently low to prevent any dangerous decomposition and sufficiently high to prevent any dangerous phase separation.

### 2.5.3.3 Principles for classification of organic peroxides

**NOTE:** This section refers only to those properties of organic peroxides which are decisive for their classification. A flow chart, presenting the classification principles in the form of a graphically arranged scheme of questions concerning the decisive properties together with the possible answers, is given in Figure 2.5.1. These properties must be determined experimentally. Suitable test methods with pertinent evaluation criteria are given in the Manual of Tests and Criteria, Part II.

2.5.3.3.1 An organic peroxide formulation must be regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.

2.5.3.3.2 The following principles apply to the classification of organic peroxide formulations not listed in 2.5.3.2.4:

- (a) Any organic peroxide formulation which can detonate or deflagrate rapidly, as packaged for transport, is prohibited from transport in that packaging under Division 5.2 (defined as ORGANIC PEROXIDE TYPE A, exit box A of Figure 2.5.1);
- (b) Any organic peroxide formulation possessing explosive properties and which, as packaged for transport, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package, must bear an “EXPLOSIVE” subsidiary hazard label (Model No. 1, see 5.2.2.2.2). Such an organic peroxide may be packaged in amounts of up to 25 kg unless the maximum quantity has to

be limited to a lower amount to preclude detonation or rapid deflagration in the package (defined as ORGANIC PEROXIDE TYPE B, exit box B of Figure 2.5.1);

- (c) Any organic peroxide formulation possessing explosive properties may be transported without an “EXPLOSIVE” subsidiary hazard label when the substance as packaged (maximum 50 kg) for transport cannot detonate or deflagrate rapidly or undergo a thermal explosion (defined as ORGANIC PEROXIDE TYPE C, exit box C of Figure 2.5.1);
- (d) Any organic peroxide formulation which in laboratory testing:
  - (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or
  - (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or
  - (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement;

is acceptable for transport in packages of not more than 50 kg net mass (defined as ORGANIC PEROXIDE TYPE D, exit box D of Figure 2.5.1);

- (e) Any organic peroxide formulation which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement is acceptable for transport in packages of not more than 400 kg/450 litres (defined as ORGANIC PEROXIDE TYPE E, exit box E of Figure 2.5.1);
- (f) Any organic peroxide formulation which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power may be considered for transport in IBCs or tanks (defined as ORGANIC PEROXIDE TYPE F, exit box F of Figure 2.5.1); for additional requirements see 4.1.7 and 4.2.1.13;
- (g) Any organic peroxide formulation which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power is exempted from Division 5.2, provided that the formulation is thermally stable (self-accelerating decomposition temperature is 60 °C or higher for a 50 kg package) and for liquid formulations diluent type A is used for desensitisation (defined as ORGANIC PEROXIDE TYPE G, exit box G of Figure 2.5.1). If the formulation is not thermally stable or a diluent other than type A is used for desensitisation, the formulation must be defined as ORGANIC PEROXIDE TYPE F.

**Figure 2.5.1: Flow chart scheme for organic peroxides**

#### **2.5.3.4 Temperature control requirements**

2.5.3.4.1 The following organic peroxides must be subjected to temperature control during transport:

- (a) Organic peroxides type B and C with an SADT  $\leq 50$  °C; and
- (b) Organic peroxides type D showing a medium effect when heated under confinement<sup>1</sup> with an SADT  $\leq 50$  °C or showing a low or no effect when heated under confinement with an SADT  $\leq 45$  °C; and
- (c) Organic peroxides types E and F with an SADT  $\leq 45$  °C.

2.5.3.4.2 Test methods for determining the SADT are given in the Manual of Tests and Criteria, Part II, section 28. The test selected must be conducted in a manner which is representative, both in size and material, of the package to be transported.

2.5.3.4.3 Test methods for determining the flammability are given in the Manual of Tests and Criteria, Part III, sub-section 32.4. Because organic peroxides may react vigorously when heated it is recommended to determine their flash point using small sample sizes such as described in ISO 3679.

#### **2.5.3.5 Desensitisation of organic peroxides**

2.5.3.5.1 In order to ensure safety during transport, organic peroxides are in many cases desensitised by organic liquids or solids, inorganic solids or water. Where a percentage of a substance is stipulated, this refers to the percentage by mass, rounded to the nearest whole number. In general, desensitisation must be such that, in case of spillage or fire, the organic peroxide will not concentrate to a dangerous extent.

2.5.3.5.2 Unless otherwise stated for the individual organic peroxide formulation, the following definitions apply for diluents used for desensitisation:

- (a) Diluents type A are organic liquids which are compatible with the organic peroxide and which have a boiling point of not less than 150 °C. Type A diluents may be used for desensitising all organic peroxides;
- (b) Diluents type B are organic liquids which are compatible with the organic peroxide and which have a boiling point of less than 150 °C but not less than 60 °C and a flash point of not less than 5 °C. Type B diluents may be used for desensitisation of all organic peroxides provided that the boiling point is at least 60 °C higher than the SADT in a 50 kg package.

2.5.3.5.3 Diluents, other than type A or type B, may be added to organic peroxide formulations as listed in 2.5.3.2.4 provided that they are compatible. However, replacement of all or part of a type A or type B diluent by another diluent with differing properties requires that the organic peroxide formulation be re-assessed in accordance with the normal acceptance procedure for Division 5.2.

---

<sup>1</sup>As determined by test series E as prescribed in the Manual of Tests and Criteria, Part II.

- 2.5.3.5.4 Water may only be used for the desensitisation of organic peroxides which are shown in 2.5.3.2.4 or in the determination according to 2.5.3.2.5 as being with water or as a stable dispersion in water.
- 2.5.3.5.5 Organic and inorganic solids may be used for desensitisation of organic peroxides provided that they are compatible.
- 2.5.3.5.6 Compatible liquids and solids are those which have no detrimental influence on the thermal stability and hazard type of the organic peroxide formulation.

## CHAPTER 2.6: CLASS 6 – TOXIC SUBSTANCES AND INFECTIOUS SUBSTANCES

### Introductory Notes

**NOTE 1:** Genetically modified micro-organisms and organisms (GMMOs and GMOs) which do not meet the definition of a toxic or an infectious substance should be considered for classification in Class 9 and assignment to UN 3245. This Code does not apply to the transport of GMMOs and GMOs to which 2.9.2.1 applies.

**NOTE 2:** Toxins from plant, animal or bacterial sources which do not contain any infectious substances, or toxins that are contained in substances which are not infectious substances, should be considered for classification in Division 6.1 and assignment to UN 3172 or UN 3462.

### 2.6.1

#### DEFINITIONS

Class 6 is divided into two divisions as follows:

(a) **Division 6.1** Toxic substances

These are substances liable either to cause death or serious injury or to harm human health if swallowed or inhaled or by skin contact;

(b) **Division 6.2** Infectious substances

These are substances known or reasonably expected to contain pathogens. Pathogens are defined as micro-organisms (including bacteria, viruses, parasites, fungi) and other agents such as prions, which can cause disease in humans or animals.

### 2.6.2

#### DIVISION 6.1 - TOXIC SUBSTANCES

#### 2.6.2.1

##### Definitions

For the purposes of this Code:

##### 2.6.2.1.1

**LD<sub>50</sub> (median lethal dose) for acute oral toxicity** is the statistically derived single dose of a substance that can be expected to cause death within 14 days in 50 per cent of young adult albino rats when administered by the oral route. The LD<sub>50</sub> value is expressed in terms of mass of test substance per mass of test animal (mg/kg).

##### 2.6.2.1.2

**LD<sub>50</sub> for acute dermal toxicity** is that dose of the substance which, administered by continuous contact for 24 hours with the bare skin of albino rabbits, is most likely to cause death within 14 days in one half of the animals tested. The number of animals tested must be sufficient to give a statistically significant result and be in conformity with good pharmacological practice. The result is expressed in milligrams per kg body mass.

|                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.6.2.1.3                                                                                                                                      | <p><b>LC<sub>50</sub> for acute toxicity on inhalation</b> is that concentration of vapour, mist or dust which, administered by continuous inhalation to both male and female young adult albino rats for one hour, is most likely to cause death within 14 days in one half of the animals tested. A solid substance must be tested if at least 10% (by mass) of its total mass is likely to be dust in a respirable range, e.g. the aerodynamic diameter of that particle-fraction is 10 microns or less. A liquid substance must be tested if a mist is likely to be generated in a leakage of the transport containment.</p> <p>Both for solid and liquid substances more than 90% (by mass) of a specimen prepared for inhalation toxicity must be in the respirable range as defined above.</p> <p>The result is expressed in milligrams per litre of air for dusts and mists or in millilitres per cubic metre of air (parts per million) for vapours.</p> |
| 2.6.2.2                                                                                                                                        | <b>Assignment of packing groups</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 2.6.2.2.1                                                                                                                                      | <p>Substances of Division 6.1, including pesticides, are allocated among the three packing groups according to their degree of toxic hazard in transport as follows:</p> <ul style="list-style-type: none"> <li>(a) <b>Packing group I:</b> Substances and preparations presenting a very severe toxicity hazard;</li> <li>(b) <b>Packing group II:</b> Substances and preparations presenting a serious toxicity hazard;</li> <li>(c) <b>Packing group III:</b> Substances and preparations presenting a relatively low toxicity hazard.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2.6.2.2.2                                                                                                                                      | In making this grouping, account must be taken of human experience in instances of accidental poisoning and of special properties possessed by any individual substance, such as liquid state, high volatility, any special likelihood of penetration, and special biological effects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2.6.2.2.3                                                                                                                                      | <p>In the absence of human experience the grouping must be based on data obtained from animal experiments. Three possible routes of administration must be examined. These routes are exposure through:</p> <ul style="list-style-type: none"> <li>(a) Oral ingestion; and</li> <li>(b) Dermal contact; and</li> <li>(c) Inhalation of dusts, mists, or vapours.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2.6.2.2.3.1                                                                                                                                    | Appropriate animal tests for the various routes of exposure are described in 2.6.2.1. When a substance exhibits a different order of toxicity by two or more of these routes of administration, the highest degree of danger indicated by the tests must be assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2.6.2.2.4                                                                                                                                      | The criteria to be applied for grouping a substance according to the toxicity it exhibits by all three routes of administration are presented in the following paragraphs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2.6.2.2.4.1                                                                                                                                    | The grouping criteria for the oral and dermal routes as well as for inhalation of dusts and mists are as shown in the following table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>Table 2.6.2.2.4.1: Grouping criteria for administration through oral ingestion, dermal contact and inhalation of dusts and mists</b></p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Packing group      | Oral toxicity<br>LD <sub>50</sub> (mg/kg)                                                                                   | Dermal toxicity<br>LD <sub>50</sub> (mg/kg) | Inhalation toxicity<br>by dusts and mists<br>LC <sub>50</sub> (mg/L) |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|----------------------------------------------------------------------|

| II                 | > 5 and ≤ 50                                                                                                                | > 50 and ≤ 200                              | > 0.2 and ≤ 2.0                                                      |
| III <sup>a</sup> . | > 50 and ≤ 300                                                                                                              | > 200 and ≤ 1000                            | > 2.0 and ≤ 4.0                                                      |
| Tables note:       | a. Tear gas substances are included in packing group II even if their toxicity data correspond to packing group III values. |                                             |                                                                      |

**NOTE:** Substances meeting the criteria of Class 8 and with an inhalation toxicity of dusts and mists (LC<sub>50</sub>) leading to packing group I are only accepted for an allocation to Division 6.1 if the toxicity through oral ingestion or dermal contact is at least in the range of packing group I or II. Otherwise an allocation to Class 8 is made when appropriate (see 2.8.2.4).

#### 2.6.2.2.4.2

The criteria for inhalation toxicity of dusts and mists in 2.6.2.2.4.1 are based on LC<sub>50</sub> data relating to 1 hour exposures and where such information is available it must be used. However, where only LC<sub>50</sub> data relating to 4 hours exposures to dusts and mists are available, such figures can be multiplied by four and the product substituted in the above criteria, i.e. LC<sub>50</sub> (4 hours) x 4 is considered the equivalent of LC<sub>50</sub> (1 hour).

#### 2.6.2.2.4.3

Liquids having toxic vapours must be assigned to the following packing groups, where “V” is the saturated vapour concentration in millilitres per cubic metre of air (volatility) at 20 °C and standard atmospheric pressure:

- (a) Packing group I:  
If  $V \geq 10 \text{ LC}_{50}$  and  $\text{LC}_{50} \leq 1,000 \text{ ml/m}^3$ ;
- (b) Packing group II:  
If  $V \geq \text{LC}_{50}$  and  $\text{LC}_{50} \leq 3,000 \text{ ml/m}^3$ , and not meeting the criteria for packing group I;
- (c) Packing group III<sup>1</sup>:  
If  $V \geq 1/5 \text{ LC}_{50}$  and  $\text{LC}_{50} \leq 5,000 \text{ ml/m}^3$ , and not meeting the criteria for packing groups I or II.

#### 2.6.2.2.4.4

In Figure 2.6.1, the criteria according to 2.6.2.2.4.3 are expressed in graphical form, as an aid to easy classification. However, because of approximations inherent in the use of graphs, substances on or near packing group borderlines must be checked using numerical criteria.

<sup>1</sup> Tear gas substances are included in packing group II even if their toxicity data correspond to packing group III values.

Figure 2.6.1: Inhalation toxicity: packaging group borderlines

- 2.6.2.2.4.5 The criteria for inhalation toxicity of vapours in 2.6.2.2.4.3 are based on LC<sub>50</sub> data relating to 1 hour exposure, and where such information is available it must be used. However, where only LC<sub>50</sub> data relating to 4 hours exposures to the vapours are available, such figures can be multiplied by two and the product substituted in the above criteria, i.e. LC<sub>50</sub> (4 hours) x 2 is considered to be the equivalent of LC<sub>50</sub> (1 hour).
- 2.6.2.2.4.6 Mixtures of liquids that are toxic by inhalation must be assigned to packing groups according to 2.6.2.2.4.7 or 2.6.2.2.4.8.
- 2.6.2.2.4.7 If LC<sub>50</sub> data are available for each of the toxic substances comprising a mixture, the packing group may be determined as follows:

- (a) Estimate the LC<sub>50</sub> of the mixture using the formula:

$$LC_{50}(\text{mixture}) = \frac{1}{\sum_{i=1}^n \left( \frac{f_i}{LC_{50i}} \right)}$$

where:

$f_i$  = mole fraction of the  $i^{\text{th}}$  component substance of the mixture;  
 LC<sub>50i</sub> = mean lethal concentration of the  $i^{\text{th}}$  component substance in ml/m<sup>3</sup>;

- (b) Estimate the volatility of each component substance using the formula:

$$V_i = \left( \frac{P_i \times 10^6}{101.3} \right) \text{ ml/m}^3$$

where:

$P_i$  = partial pressure of the  $i^{\text{th}}$  component substance in kPa at 20 °C and one atmosphere pressure;

- (c) Calculate the ratio of the volatility to the LC<sub>50</sub> using the formula:

$$R = \sum_{i=1}^n \left( \frac{V_i}{LC_{50i}} \right)$$

- (d) Using the calculated values LC<sub>50</sub> (mixture) and R, the packing group for the mixture is determined:
- (i) Packing group I:  $R \geq 10$  and  $LC_{50}(\text{mixture}) \leq 1000 \text{ ml/m}^3$ ;
  - (ii) Packing group II:  $R \geq 1$  and  $LC_{50}(\text{mixture}) \leq 3000 \text{ ml/m}^3$  and not meeting criteria for packing group I;
  - (iii) Packing group III:  $R \geq 1/5$  and  $LC_{50}(\text{mixture}) \leq 5000 \text{ ml/m}^3$  and not meeting criteria for packing groups I or II.

#### 2.6.2.2.4.8

In the absence of LC<sub>50</sub> data on the toxic constituent substances, the mixture may be assigned a packing group based on the following simplified threshold toxicity tests. When these threshold tests are used, the most restrictive packing group determined is used for transporting the mixture.

- (a) A mixture is assigned to packing group I only if it meets both of the following criteria:
  - (i) A sample of the liquid mixture is vapourised and diluted with air to create a test atmosphere of 1000 ml/m<sup>3</sup> vapourised mixture in air. Ten albino rats (five male and five female) are exposed to the test atmosphere for one hour and observed for fourteen days. If five or more of the animals die within the fourteen day observation period, the mixture is presumed to have an LC<sub>50</sub> equal to or less than 1000 ml/m<sup>3</sup>;
  - (ii) A sample of the vapour in equilibrium with the liquid mixture at 20 °C is diluted with 9 equal volumes of air to form a test atmosphere. Ten albino rats (five male and five female) are exposed to the test atmosphere for one hour and observed for fourteen days. If five or more of the animals die within the fourteen day observation period, the mixture is presumed to have a volatility equal to or greater than 10 times the mixture LC<sub>50</sub>;
- (b) A mixture is assigned to packing group II only if it meets both of the following criteria, and the mixture does not meet the criteria for packing group I:
  - (i) A sample of the liquid mixture is vapourised and diluted with air to create a test atmosphere of 3000 ml/m<sup>3</sup> vapourised mixture in air. Ten albino rats (five male and five female) are exposed to the test atmosphere for one hour and observed for fourteen days. If five or more of the animals die within the fourteen day observation period, the mixture is presumed to have an LC<sub>50</sub> equal to or less than 3000 ml/m<sup>3</sup>;
  - (ii) A sample of the vapour in equilibrium with the liquid mixture at 20 °C is used to form a test atmosphere. Ten albino rats (five male and five female) are exposed to the test atmosphere for one hour and observed for fourteen days. If five or more of the animals die within the fourteen day observation period, the mixture is presumed to have a volatility equal to or greater than the mixture LC<sub>50</sub>;
- (c) A mixture is assigned to packing group III only if it meets both of the following criteria, and the mixture does not meet the criteria for packing groups I or II:
  - (i) A sample of the liquid mixture is vapourised and diluted with air to create a test atmosphere of 5000 ml/m<sup>3</sup> vapourised mixture in air. Ten albino rats (five male and five female) are exposed to the test atmosphere for one hour and observed for fourteen days. If five or more of the animals die within the fourteen day observation period, the mixture is presumed to have an LC<sub>50</sub> equal to or less than 5000 ml/m<sup>3</sup>;

- (ii) The vapour pressure of the liquid mixture is measured and if the vapour concentration is equal to or greater than 1000 ml/m<sup>3</sup>, the mixture is presumed to have a volatility equal to or greater than 1/5 the mixture LC<sub>50</sub>.

### 2.6.2.3 Methods for determining oral and dermal toxicity of mixtures

2.6.2.3.1 When classifying and assigning the appropriate packing group to mixtures in Division 6.1, in accordance with the oral and dermal toxicity criteria in 2.6.2.2, it is necessary to determine the acute LD<sub>50</sub> of the mixture.

2.6.2.3.2 If a mixture contains only one active substance, and the LD<sub>50</sub> of that constituent is known, in the absence of reliable acute oral and dermal toxicity data on the actual mixture to be transported, the oral or dermal LD<sub>50</sub> may be obtained by the following method:

$$LD_{50} \text{ value of preparation} = \frac{LD_{50} \text{ value of active substance} \times 100}{\text{percentage of active substance by mass}}$$

2.6.2.3.3 If a mixture contains more than one active constituent, there are three possible approaches that may be used to determine the oral or dermal LD<sub>50</sub> of the mixture. The preferred method is to obtain reliable acute oral and dermal toxicity data on the actual mixture to be transported. If reliable, accurate data is not available, then either of the following methods may be performed:

- (a) Classify the formulation according to the most hazardous constituent of the mixture as if that constituent were present in the same concentration as the total concentration of all active constituents; or
- (b) Apply the formula:

$$\frac{C_A}{T_A} + \frac{C_B}{T_B} + \dots + \frac{C_Z}{T_Z} = \frac{100}{T_M}$$

where:

C = the % concentration of constituent A, B ... Z in the mixture;

T = the oral LD<sub>50</sub> values of constituent A, B ... Z;

T<sub>M</sub> = the oral LD<sub>50</sub> value of the mixture.

**NOTE:** This formula can also be used for dermal toxicities provided that this information is available on the same species for all constituents. The use of this formula does not take into account any potentiation or protective phenomena.

## 2.6.2.4 Classification of pesticides

2.6.2.4.1 All active pesticide substances and their preparations for which the  $LC_{50}$  and/or  $LD_{50}$  values are known and which are classified in Division 6.1 must be classified under appropriate packing groups in accordance with the criteria given in 2.6.2.2. Substances and preparations which are characterised by subsidiary hazards must be classified according to the precedence of hazard table in chapter 2.0 with the assignment of appropriate packing groups.

2.6.2.4.2 If the oral or dermal  $LD_{50}$  value for a pesticide preparation is not known, but the  $LD_{50}$  value of its active substance(s) is known, the  $LD_{50}$  value for the preparation may be obtained by applying the procedures in 2.6.2.3.

**NOTE:**  $LD_{50}$  toxicity data for a number of common pesticides may be obtained from the most current edition of the document "The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification" available from the International Programme on Chemical Safety, World Health Organisation (WHO), 1211 Geneva 27, Switzerland. While that document may be used as a source of  $LD_{50}$  data for pesticides, its classification system must not be used for purposes of transport classification of, or assignment of packing groups to, pesticides, which must be in accordance with this Code.

2.6.2.4.3 The proper shipping name used in the transport of the pesticide must be selected on the basis of the active ingredient, of the physical state of the pesticide and any subsidiary hazards it may exhibit.

**NOTE:** Pesticide substances and their preparations that are not specifically named in the Dangerous Goods List in 3.2.5, must be assigned to the most appropriate generic pesticide name and its corresponding UN number which are listed for pesticides of Class 3 or Division 6.1 in Table 3.3 in 3.2.6.

2.6.2.5 Substances not accepted for transport

Chemically unstable substances of Division 6.1 shall not be accepted for transport unless the necessary precautions have been taken to prevent the possibility of a dangerous decomposition or polymerization under normal conditions of transport. For the precautions necessary to prevent polymerization, see special provision 386 of Chapter 3.3. To this end particular care shall be taken to ensure that receptacles and tanks do not contain any substances liable to promote these reactions.

## 2.6.3 DIVISION 6.2 - INFECTIOUS SUBSTANCES

**NOTE 1:** Guidance on the transport of pathological samples may be found in the latest edition of "Requirements for the Packaging and Transport of Pathology Specimens and Associated Materials" from National Pathology Accreditation Advisory Council (NPAAC).

### 2.6.3.1 Definitions

For the purposes of this Code:

- 2.6.3.1.1 **Infectious substances** are substances which are known or are reasonably expected to contain pathogens. Pathogens are defined as micro-organisms (including bacteria, viruses, parasites, fungi) and other agents such as prions, which can cause disease in humans or animals.
- 2.6.3.1.2 **Biological products** are those products derived from living organisms which are manufactured and distributed in accordance with the requirements of appropriate national authorities, which may have special licensing requirements, and are used either for prevention, treatment, or diagnosis of disease in humans or animals, or for development, experimental or investigational purposes related thereto. They include, but are not limited to, finished or unfinished products such as vaccines.
- 2.6.3.1.3 **Cultures** are the result of a process by which pathogens are intentionally propagated. This definition does not include human or animal patient specimens as defined in 2.6.3.1.4.
- 2.6.3.1.4 **Patient specimens** are those, collected directly from humans or animals, including, but not limited to, excreta, secreta, blood and its components, tissue and tissue fluid swabs, and body parts being transported for purposes such as research, diagnosis, investigational activities, disease treatment and prevention.
- 2.6.3.1.5 Deleted
- 2.6.3.1.6 **Medical or clinical wastes** are wastes derived from the veterinary treatment of animals, the medical treatment of humans or from bio-research.
- 2.6.3.2 Classification of infectious substances**
- 2.6.3.2.1 Infectious substances must be classified in Division 6.2 and assigned to UN 2814, UN 2900, UN 3291, UN 3373 or 3549, as appropriate.
- 2.6.3.2.2 Infectious substances are divided into the following categories:
- 2.6.3.2.2.1 Category A: An infectious substance which is transported in a form that, when exposure to it occurs, is capable of causing permanent disability, life-threatening or fatal disease in otherwise healthy humans or animals. Indicative examples of substances that meet these criteria are given in the table in this paragraph.
- NOTE:** *An exposure occurs when an infectious substance is released outside of the protective packaging, resulting in physical contact with humans or animals.*
- (a) Infectious substances meeting these criteria which cause disease in humans or both in humans and animals must be assigned to UN 2814. Infectious substances which cause disease only in animals must be assigned to UN 2900.
  - (b) Assignment to UN 2814 or UN 2900 must be based on the known medical history and symptoms of the source human or animal, endemic local conditions, or professional judgement concerning individual circumstances of the source human or animal.
- NOTE 1:** *The proper shipping name for UN 2814 is INFECTIOUS SUBSTANCE, AFFECTING HUMANS. The proper shipping name for UN 2900 is INFECTIOUS SUBSTANCE, AFFECTING ANIMALS only.*

**NOTE 2:** The following table is not exhaustive. Infectious substances, including new or emerging pathogens, which do not appear in the table but which meet the same criteria must be assigned to Category A. In addition, if there is doubt as to whether or not a substance meets the criteria it must be included in Category A.

**NOTE 3:** In the following table, the micro-organisms written in italics are bacteria or fungi.

**Indicative examples of infectious substances included in category A in any form unless otherwise indicated (2.6.3.2.2.1 (a))**

| UN Number and Proper Shipping Name                | Microorganism                                                        |
|---------------------------------------------------|----------------------------------------------------------------------|
| UN 2814<br>Infectious substances affecting humans | Bacillus anthracis (cultures only)                                   |
|                                                   | Brucella abortus (cultures only)                                     |
|                                                   | Brucella melitensis (cultures only)                                  |
|                                                   | Brucella suis (cultures only)                                        |
|                                                   | Burkholderia mallei - Pseudomonas mallei – Glanders (cultures only)  |
|                                                   | Burkholderia pseudomallei – Pseudomonas pseudomallei (cultures only) |
|                                                   | Chlamydia psittaci - avian strains (cultures only)                   |
|                                                   | Clostridium botulinum (cultures only)                                |
|                                                   | Coccidioides immitis (cultures only)                                 |
|                                                   | Coxiella burnetii (cultures only)                                    |
|                                                   | Crimean-Congo hemorrhagic fever virus                                |
|                                                   | Dengue virus (cultures only)                                         |
|                                                   | Eastern equine encephalitis virus (cultures only)                    |
|                                                   | Escherichia coli, verotoxigenic (cultures only)                      |
|                                                   | Ebola virus                                                          |
|                                                   | Flexal virus                                                         |
|                                                   | Francisella tularensis (cultures only)                               |
|                                                   | Guanarito virus                                                      |
|                                                   | Hantaan virus                                                        |
|                                                   | Hantaviruses causing hemorrhagic fever with renal syndrome           |
|                                                   | Hendra virus                                                         |
|                                                   | Hepatitis B virus (cultures only)                                    |
|                                                   | Herpes B virus (cultures only)                                       |

| UN Number and Proper Shipping Name | Microorganism                                            |
|------------------------------------|----------------------------------------------------------|
|                                    | Human immunodeficiency virus (cultures only)             |
|                                    | Highly pathogenic avian influenza virus (cultures only)  |
|                                    | Japanese Encephalitis virus (cultures only)              |
|                                    | Junin virus                                              |
|                                    | Kyasanur Forest disease virus                            |
|                                    | Lassa virus                                              |
|                                    | Machupo virus                                            |
|                                    | Marburg virus                                            |
|                                    | Monkeypox virus (cultures only)                          |
|                                    | Mycobacterium tuberculosis (cultures only)               |
|                                    | Nipah virus                                              |
|                                    | Omsk hemorrhagic fever virus                             |
|                                    | Poliovirus (cultures only)                               |
|                                    | Rabies virus (cultures only)                             |
|                                    | Rickettsia prowazekii (cultures only)                    |
|                                    | Rickettsia rickettsii (cultures only)                    |
|                                    | Rift Valley fever virus (cultures only)                  |
|                                    | Russian spring-summer encephalitis virus (cultures only) |
|                                    | Sabia virus                                              |
|                                    | Shigella dysenteriae type 1 (cultures only)              |
|                                    | Tick-borne encephalitis virus (cultures only)            |
|                                    | Variola virus                                            |
|                                    | Venezuelan equine encephalitis virus (cultures only)     |
|                                    | West Nile virus (cultures only)                          |
|                                    | Yellow fever virus (cultures only)                       |
|                                    | Yersinia pestis (cultures only)                          |

| UN Number and Proper Shipping Name                      | Microorganism                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------|
| UN 2900<br>Infectious substances affecting animals only | African swine fever virus (cultures only)                                      |
|                                                         | Avian paramyxovirus Type 1 -Velogenic New-castle disease virus (cultures only) |
|                                                         | Classical swine fever virus (cultures only)                                    |
|                                                         | Foot and mouth disease virus (cultures only)                                   |
|                                                         | Lumpy skin disease virus (cultures only)                                       |
|                                                         | Mycoplasma mycoides - Contagious bovine pleuropneumonia (cultures only)        |
|                                                         | Peste des petits ruminants virus (cultures only)                               |
|                                                         | Rinderpest virus (cultures only)                                               |
|                                                         | Sheep-pox virus (cultures only)                                                |
|                                                         | Goatpox virus (cultures only)                                                  |
|                                                         | Swine vesicular disease virus (cultures only)                                  |
|                                                         | Vesicular stomatitis virus (cultures only)                                     |

#### 2.6.3.2.2.2

Category B: An infectious substance which does not meet the criteria for inclusion in Category A. Infectious substances in Category B must be assigned to UN 3373, except for medical or clinical wastes containing infectious substances in Category B (see 2.6.3.5).

**NOTE:** The proper shipping name of UN3373 is “BIOLOGICAL SUBSTANCE, CATEGORY B.”

#### 2.6.3.2.3

Exemptions

##### 2.6.3.2.3.1

Substances which do not contain infectious substances or substances which are unlikely to cause disease in humans or animals are not subject to this Code unless they meet the criteria for inclusion in another class.

**NOTE:** Examples of such substances not subject to this Code are Diagnostic specimens resulting from medical practice (specimens being transported from a doctor's office or surgery to a laboratory, from a hospital to a diagnostic laboratory or from one laboratory to another, except where it is being transported to determine if an infectious substance is present) medical research, veterinary practice or plant material being transported to a diagnostic laboratory.

##### 2.6.3.2.3.2

Substances containing microorganisms which are non-pathogenic to humans or animals are not subject to this Code unless they meet the criteria for inclusion in another class.

##### 2.6.3.2.3.3

Substances in a form that any present pathogens have been neutralised or inactivated such that they no longer pose a health risk are not subject to this Code unless they meet the criteria for inclusion in another class.

**NOTE:** Medical equipment that has been drained of free liquid is deemed to meet the requirements of this paragraph and is not subject to this Code.

- 2.6.3.2.3.4 Environmental samples (including food and water samples) which are not considered to pose a significant risk of infection are not subject to this Code unless they meet the criteria for inclusion in another class.
- 2.6.3.2.3.5 Dried blood spots, collected by applying a drop of blood onto absorbent material, are not subject to this Code.
- 2.6.3.2.3.6 Faecal occult blood screening samples, are not subject to this Code.
- 2.6.3.2.3.7 Blood or blood components which have been collected for the purposes of transfusion or for the preparation of blood products to be used for transfusion or transplantation and any tissues or organs intended for use in transplantation as well as samples drawn in connection with such purpose are not subject to this Code.
- 2.6.3.2.3.8 Human or animal specimens for which there is minimal likelihood that pathogens are present are not subject to this Code if the specimen is transported in a packaging which will prevent any leakage and which is marked with the words “Exempt human specimen” or “Exempt animal specimen”, as appropriate. The packaging should meet the following conditions:
- (a) The packaging should consist of three components:
    - (i) a leak-proof primary receptacle(s);
    - (ii) a leak-proof secondary packaging; and
    - (iii) an outer packaging of adequate strength for its capacity, mass and intended use, and with at least one surface having minimum dimensions of 100 mm × 100 mm;
  - (b) For liquids, absorbent material in sufficient quantity to absorb the entire contents should be placed between the primary receptacle(s) and the secondary packaging so that, during transport, any release or leak of a liquid substance will not reach the outer packaging and will not compromise the integrity of the cushioning material;
  - (c) When multiple fragile primary receptacles are placed in a single secondary packaging, they should be either individually wrapped or separated to prevent contact between them.

**NOTE 1:** An element of professional judgment is required to determine if a substance is exempt under this paragraph. That judgment should be based on the known medical history, symptoms and individual circumstances of the source, human or animal, and endemic local conditions. Examples of specimens which may be transported under this paragraph include the blood or urine tests to monitor cholesterol levels, blood glucose levels, hormone levels, or prostate specific antibodies (PSA); those required to monitor organ function such as heart, liver or kidney function for humans or animals with non-infectious diseases, or for therapeutic drug monitoring; those conducted for insurance or employment purposes and are intended to determine the presence of drugs or alcohol; pregnancy test; biopsies to detect cancer; and antibody detection in humans or animals, in the absence of any concern for

*infection (e.g. evaluation of vaccine induced immunity, diagnosis of autoimmune disease, etc.).*

**NOTE 2:** For air transport, packagings for specimens exempted under this paragraph must meet the conditions in (a) to (c).

#### 2.6.3.2.3.9

Except for:

- (a) medical waste (UN 3291 and UN 3549);
- (b) medical devices or equipment contaminated with or containing infectious substances in Category A (UN 2814 or UN 2900); and
- (c) medical devices or equipment contaminated with or containing other dangerous goods that meet the definition of another hazard class;

medical devices or equipment potentially contaminated with or containing infectious substances which are being transported for disinfection, cleaning, sterilisation, repair, or equipment evaluation are not subject to the provisions of this Code if packed in packagings designed and constructed in such a way that, under normal conditions of transport, they cannot break, be punctured or leak their contents. Packagings must be designed to meet the construction requirements listed in 6.1.4 or 6.6.5.

These packagings must meet the general packing requirements of 4.1.1.1 and 4.1.1.2 and be capable of retaining the medical devices and equipment when dropped from a height of 1.2 m. For air transport, additional requirements may apply.

The packagings must be marked "USED MEDICAL DEVICE" or "USED MEDICAL EQUIPMENT". When using overpacks, these must be marked in the same way, except when the inscription remains visible.

### 2.6.3.3

#### **Biological products**

#### 2.6.3.3.1

For the purposes of this Code, biological products are divided into the following groups:

- (a) Those which are manufactured and packaged in accordance with the requirements of appropriate national authorities and transported for the purposes of final packaging or distribution, and use for personal health care by medical professionals or individuals. Substances in this group are not subject to this Code.
- (b) Those which do not fall under paragraph (a) and are known or reasonably believed to contain infectious substances and which meet the criteria for inclusion in Category A or Category B. Substances in this group must be assigned to UN 2814, UN 2900 or UN 3373, as appropriate.

**NOTE:** Some licensed biological products may present a biohazard only in certain parts of the world. In that case, competent authorities may require these biological products to be in compliance with local requirements for infectious substances or may impose other restrictions.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>2.6.3.4</b> | <b>Genetically modified micro-organisms and organisms</b>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 2.6.3.4.1      | Genetically modified micro-organisms not meeting the definition of infectious substance must be classified according to chapter 2.9.                                                                                                                                                                                                                                                                                                                                                              |
| <b>2.6.3.5</b> | <b>Medical or clinical wastes</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2.6.3.5.1      | <p>Medical or clinical waste containing:</p> <p>(a) Category A infectious substances shall be assigned to UN 2814, UN 2900 or UN 3549 as appropriate. Solid medical waste containing Category A infectious substances generated from the medical treatment of humans or veterinary treatment of animals may be assigned to UN 3549. The UN 3549 entry shall not be used for waste from bio-research or liquid waste;</p> <p>(b) Category B infectious substances shall be assigned to UN 3291</p> |
| 2.6.3.5.2      | <p>Medical or clinical wastes which are reasonably believed to have a low probability of containing infectious substances must be assigned to UN 3291. For the assignment, international, regional or national waste catalogues may be taken into account.</p> <p><b>NOTE:</b> <i>The proper shipping name for UN 3291 is “CLINICAL WASTE, UNSPECIFIED, N.O.S.” or “(BIO) MEDICAL WASTE, N.O.S.” or “REGULATED MEDICAL WASTE, N.O.S.”</i></p>                                                     |
| 2.6.3.5.3      | Decontaminated medical or clinical wastes which previously contained infectious substances are not subject to this Code unless they meet the criteria for inclusion in another class.                                                                                                                                                                                                                                                                                                             |
| <b>2.6.3.6</b> | <b>Infected animals</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2.6.3.6.1      | Unless an infectious substance cannot be consigned by any other means, live animals must not be used to consign such a substance. A live animal which has been intentionally infected and is known or suspected to contain an infectious substance must only be transported under terms and conditions approved by the relevant health authority.                                                                                                                                                 |
| 2.6.3.6.2      | Deleted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## CHAPTER 2.7: CLASS 7 - RADIOACTIVE MATERIAL

### Introductory Notes

**NOTE 1:** Much of chapter 2.7 has been deleted from the previous editions of the ADG Code. This was determined at a meeting of Standing Council on Transport and Infrastructure (SCOTI) as part of the Transport of Dangerous Goods (TPG) Amendment Package (AP) Number 2. The reasons for this change are explained in Note 2 below.

The following information from the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) now replaces the information found in earlier editions of the ADG Code.

[Code for the Safe Transport of Radioactive Material](#)

**NOTE 2:** THE TRANSPORT OF CLASS 7 IS NOT SUBJECT TO THIS CODE except when it is being transported on the same road vehicle or train as dangerous goods of other classes. When Class 7 dangerous goods are being transported with other dangerous goods, the segregation requirements of Part 9 apply.

Transport of Class 7 by road or rail in Australia is subject to state or territory Acts and regulations, and are based on the Code for the Safe Transport of Radioactive Material (2019) published by the Australian Radiation Protection and Nuclear Safety Agency: <https://www.arpansa.gov.au/regulation-and-licensing/regulatory-publications/radiation-protection-series/codes-and-standards/rpsc-2..>

2.7.2.1.1 and Table 2.7.2.1.1 are provided for information only.

**NOTE 3:** For Class 7, the type of packaging may have a decisive effect on classification.

### 2.7.1 DELETED

### 2.7.2 CLASSIFICATION

#### 2.7.2.1 General provisions

2.7.2.1.1 Radioactive material must be assigned to one of the UN number specified in Table 2.7.2.1.1 in accordance with state and territory legislation and the code of practice for the safe transport of radioactive substance that implements 2.7.2.2 to 2.7.2.5 taking into account the material characteristics determined in 2.7.2.3.

| Table 2.7.2.1.1: Assignment of UN Numbers |                                                                                                                            |

## CHAPTER 2.8: CLASS 8 - CORROSIVE SUBSTANCES

### 2.8.1 DEFINITION AND GENERAL PROVISIONS

- 2.8.1.1 **Corrosive substances** are substances which, by chemical action, will cause irreversible damage to the skin, or, in the case of leakage, will materially damage, or even destroy, other goods or the means of transport.
- 2.8.1.2 For substances and mixtures that are corrosive to skin, general classification provisions are provided in section 2.8.2. Skin corrosion refers to the production of irreversible damage to the skin, namely, visible necrosis through the epidermis and into the dermis occurring after exposure to a substance or mixture.
- 2.8.1.3 Liquids and solids which may become liquid during transport, which are judged not to be skin corrosive shall still be considered for their potential to cause corrosion to certain metal surfaces in accordance with the criteria in 2.8.3.3 (c) (ii).

### 2.8.2 GENERAL CLASSIFICATION PROVISIONS

- 2.8.2.1 Substances and mixtures of Class 8 are divided among the three packing groups according to their degree of danger in transport :
- (a) Packing group I: Very dangerous substances and mixtures;
  - (b) Packing group II: Substances and mixtures presenting medium danger;
  - (c) Packing group III: Substances and mixtures that present minor danger.
- 2.8.2.2 Allocation of substances listed in the Dangerous Goods List in chapter 3.2 to the packing groups in Class 8 has been made on the basis of experience taking into account such additional factors as inhalation risk (see 2.8.2.4) and reactivity with water (including the formation of dangerous decomposition products).
- 2.8.2.3 New substances and mixtures, can be assigned to packing groups on the basis of the length of time of contact necessary to produce irreversible damage of intact skin tissue in accordance with the criteria in 2.8.3. Alternatively, for mixtures, the criteria in 2.8.4 can be used.
- 2.8.2.4 A substance or mixture meeting the criteria of Class 8 having an inhalation toxicity of dusts and mists (LC<sub>50</sub>) in the range of packing group I, but toxicity through oral ingestion or dermal contact only in the range of packing group III or less, must be allocated to Class 8 (see note under 2.6.2.2.4.1).

### 2.8.3 PACKING GROUP ASSIGNMENT FOR SUBSTANCES AND MIXTURES

- 2.8.3.1 Existing human and animal data including information from single or repeated exposure shall be the first line of evaluation, as they give information directly relevant to effects on the skin.

### 2.8.3.2

In assigning the packing group in accordance with 2.8.2.3, account shall be taken of human experience in instances of accidental exposure. In the absence of human experience, classification must be based on data obtained from experiments in accordance with OECD Test Guideline Nos. 404<sup>1</sup>, 435<sup>2</sup>, 431<sup>3</sup>, 430<sup>4</sup>. A substance or mixture which is determined not to be corrosive in accordance with one of these or non-classified in accordance with OECD Test Guideline No. 439<sup>5</sup>, may be considered not to be corrosive to skin for the purposes of this Code without further testing. If the test results indicate that the substance or mixture is corrosive and not assigned to packing group I, but the test method does not allow discrimination between packing groups II and III, it shall be considered to be packing group II. If the test results indicate that the substance or mixture is corrosive, but the test method does not allow discrimination between packing groups, it must be assigned to packing group I if no other test results indicate a different packing group.

### 2.8.3.3

Packing groups are assigned to corrosive substances in accordance with the following criteria (see table 2.8.3.4):

- (a) Packing group I is assigned to substances that cause irreversible damage of intact skin tissue within an observation period up to 60 minutes starting after the exposure time of three minutes or less;
- (b) Packing group II is assigned to substances that cause irreversible damage of intact skin tissue within an observation period up to 14 days starting after the exposure time of more than three minutes but not more than 60 minutes;
- (c) Packing group III is assigned to substances that:
  - (i) cause irreversible damage of intact skin tissue within an observation period up to 14 days starting after the exposure time of more than 60 minutes but not more than 4 hours; or
  - (ii) are judged not to cause irreversible damage of intact skin tissue but which exhibit a corrosion rate on either steel or aluminium surfaces exceeding 6.25 mm a year at a test temperature of 55 °C, when tested on both materials. For the purposes of testing steel, type S235JR+CR (1.0037 resp. St 37-2), S275J2G3+CR (1.0144 resp. St 44-3), ISO 3574, Unified Numbering System (UNS) G10200 or SAE 1020, and for testing aluminium, non-clad, types 7075-T6 or AZ5GU-T6 shall be used. An acceptable test is prescribed in the Manual of Tests and Criteria, Part III, Section 37.

<sup>2</sup>OECD Guideline for the testing of chemicals No. 435 "In Vitro Membrane Barrier Test Method for Skin Corrosion" 2015

<sup>3</sup>OECD Guideline for the testing of chemicals No. 431 "In Vitro skin corrosion: reconstructed human epidermis (RHE) test method" 2016

<sup>4</sup>OECD Guideline for the testing of chemicals No. 430 In Vitro Skin Corrosion: Transcutaneous Electrical Resistance Test Method (TER)" 2015

<sup>5</sup>OECD Guideline for the testing of chemicals No. 439 "In Vitro Skin Irritation: Reconstructed Human Epidermis Test Method" 2015

**NOTE 1:** Where an initial test on either steel or aluminium indicates the substance being tested is corrosive the follow up test on the other metal is not required.

**NOTE 2:** In the absence of corrosive test data, liquid waste substances that have a pH less than 2.0 or greater than 12.5 should be assigned to packing group II<sup>1</sup>

**Table 2.8.3.4: Table summarising the criteria in 2.8.3.3**

| Packing Group | Exposure Time | Observation Period | Effect                                                                                                                                     |
|---------------|---------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| I             | ≤ 3 min       | ≤ 60 min           | Irreversible damage of intact skin                                                                                                         |
| II            | > 3 min ≤ 1 h | ≤ 14 d             | Irreversible damage of intact skin                                                                                                         |
| III           | > 1 h ≤ 4 h   | ≤ 14 d             | Irreversible damage of intact skin                                                                                                         |
| III           | —             | —                  | Corrosion rate on either steel or aluminium surfaces exceeding 6.25 mm a year at a test temperature of 55 °C when tested on both materials |

## 2.8.4 ALTERNATIVE PACKING GROUP ASSIGNMENT METHODS FOR MIXTURES: Step-wise approach

### 2.8.4.1 General provisions

2.8.4.1.1 For mixtures it is necessary to obtain or derive information that allows the criteria to be applied to the mixture for the purpose of classification and assignment of packing groups. The approach to classification and assignment of packing groups is tiered, and is dependent upon the amount of information available for the mixture itself, for similar mixtures and/or for its ingredients. The flow chart of Figure 2.8.4.1 below outlines the process to be followed:

---

<sup>1</sup>This is NOT a general rule that can be applied to non-waste substances where corrosive test data must be obtained.

**Figure 2.8.4.1: Step-wise approach to classify and assign packing group of corrosive mixtures**

## 2.8.4.2

### Bridging principles

#### 2.8.4.2.1

Where a mixture has not been tested to determine its skin corrosion potential, but there are sufficient data on both the individual ingredients and similar tested mixtures to adequately classify and assign a packing group for the mixture, these data will be used in accordance with the following bridging principles. This ensures that the classification process uses the available data to the greatest extent possible in characterizing the hazards of the mixture.

- (a) Dilution: If a tested mixture is diluted with a diluent which does not meet the criteria for Class 8 and does not affect the packing group of other ingredients, then the new diluted mixture may be assigned to the same packing group as the original tested mixture.

**NOTE:** *in certain cases, diluting a mixture or substance may lead to an increase in the corrosive properties. If this is the case, this bridging principle cannot be used.*

- (b) Batching: The skin corrosion potential of a tested production batch of a mixture can be assumed to be substantially equivalent to that of another untested production batch of the same commercial product when produced by or under the control of the same manufacturer, unless there is reason to believe there is significant variation such that the skin corrosion potential of the untested batch has changed. If the latter occurs, a new classification is necessary.
- (c) Concentration of mixtures of packing group I: If a tested mixture meeting the criteria for inclusion in packing group I is concentrated, the more concentrated untested mixture may be assigned to packing group I without additional testing.
- (d) Interpolation within one packing group: For three mixtures (A, B and C) with identical ingredients, where mixtures A and B have been tested and are in the same skin corrosion packing group, and where

untested mixture C has the same Class 8 ingredients as mixtures A and B but has concentrations of Class 8 ingredients intermediate to the concentrations in mixtures A and B, then mixture C is assumed to be in the same skin corrosion packing group as A and B.

- (e) Substantially similar mixtures: Given the following:
- (i) Two mixtures: (A+B) and (C+B);
  - (ii) The concentration of ingredient B is the same in both mixtures
  - (iii) The concentration of ingredient A in mixture (A+B) equals the concentration of ingredient C in mixture (C+B);
  - (iv) Data on skin corrosion for ingredients A and C are available and substantially equivalent, i.e. they are the same skin corrosion packing group and do not affect the skin corrosion potential of B.

If mixture (A+B) or (C+B) is already classified based on test data, then the other mixture may be assigned to the same packing group.

### 2.8.4.3 Calculation method based on the classification of the substances

2.8.4.3.1 Where a mixture has not been tested to determine its skin corrosion potential, nor is sufficient data available on similar mixtures, the corrosive properties of the substances in the mixture shall be considered to classify and assign a packing group.

Applying the calculation method is only allowed if there are no synergistic effects that make the mixture more corrosive than the sum of its substances. This restriction applies only if packing group II or III would be assigned to the mixture.

2.8.4.3.2 When using the calculation method, all Class 8 ingredients present at a concentration of  $\geq 1\%$  shall be taken into account, or  $< 1\%$  if these ingredients are still relevant for classifying the mixture to be corrosive to skin.

2.8.4.3.3 To determine whether a mixture containing corrosive substances shall be considered a corrosive mixture and to assign a packing group, the calculation method in the flow chart in Figure 2.8.4.3 shall be applied. For this calculation method, generic concentration limits apply where 1% is used in the first step for the assessment of the packing group I substances, and where 5% is used for the other steps respectively.

2.8.4.3.4 When a specific concentration limit (SCL) is assigned to a substance following its entry in the Dangerous Goods List or in a Special Provision, this limit shall be used instead of the generic concentration limits (GCL).

2.8.4.3.5 For this purpose, the summation formula for each step of the calculation method shall be adapted. This means that, where applicable, the generic concentration limit shall be substituted by the specific concentration limit assigned to the substance(s) (SCL<sub>i</sub>), and the adapted formula is a weighted average of the different concentration limits assigned to the different substances in the mixture:

$$\frac{PGx_1}{GCL} + \frac{PGx_2}{SCL_2} + \dots + \frac{PGx_i}{SCL_i} \geq 1$$

Where:

PGxi = concentration of substance 1, 2 ...i in the mixture, assigned to packing group x (I, II or III)

GCL = generic concentration limit

SCLi = specific concentration limit assigned to substance i

The criterion for a packing group is fulfilled when the result of the calculation is  $\geq 1$ . The generic concentration limits to be used for the evaluation in each step of the calculation method are those found in Figure 2.8.4.3.

Examples for the application of the above formula can be found in the note below.

**NOTE:** Examples for the application of the above formula

Example 1: A mixture contains one corrosive substance in a concentration of 5% assigned to packing group I without a specific concentration limit:

*Calculation for packing group I:*

$$\frac{5}{5 (GCL)} = 1 \rightarrow \text{assign to class 8, packing group I.}$$

Example 2: A mixture contains three substances corrosive to skin; two of them (A and B) have specific concentration limits; for the third one (C) the generic concentration limits applies. The rest of the mixture needs not to be taken into consideration:

| Substance X in the mixture and its packing group assignment within Class 8 | Concentration (conc) in the mixture in % | Specific concentration limit (SCL) for packing group I | Specific concentration limit (SCL) for packing group II | Specific concentration limit (SCL) for packing group III |
|----------------------------------------------------------------------------|------------------------------------------|--------------------------------------------------------|---------------------------------------------------------|----------------------------------------------------------|
| A, assigned to packing group I                                             | 3                                        | 30%                                                    | none                                                    | none                                                     |
| B, assigned to packing group I                                             | 2                                        | 20%                                                    | 10%                                                     | none                                                     |
| C, assigned to packing group III                                           | 10                                       | none                                                   | none                                                    | none                                                     |

*Calculation for packing group I:*

$$\frac{3 (conc A)}{30 (SCL PGI)} + \frac{2 (conc B)}{20 (SCL PGI)} = 0.2 < 1$$

The criterion for packing group I is not fulfilled

*Calculation for packing group II:*

$$\frac{3 (conc A)}{5 (SCL PGII)} + \frac{2 (conc B)}{10 (SCL PGII)} = 0.8 < 1$$

The criterion for packing group II is not fulfilled

*Calculation for packing group III:*

$$\frac{3 (\text{conc A})}{5 (SCL PGIII)} + \frac{2 (\text{conc B})}{5 (SCL PGIII)} + \frac{10 (\text{conc C})}{5 (GCL PGIII)} = 3 \geq 1$$

The criterion for packing group III is fulfilled, the mixture shall be assigned to class 8, packing group III

**Figure 2.8.4.3: Calculation method**

## 2.8.5

### SUBSTANCES NOT ACCEPTED FOR TRANSPORT

Chemically unstable substances of Class 8 shall not be accepted for transport unless the necessary precautions have been taken to prevent the possibility of a dangerous decomposition or polymerization under normal conditions of transport. For the precautions necessary to prevent polymerization, see special provision 386 of chapter 3.3. To this end particular care shall be taken to ensure that receptacles and tanks do not contain any substances liable to promote these reactions.

## CHAPTER 2.9: CLASS 9 - MISCELLANEOUS DANGEROUS SUBSTANCES AND ARTICLES, INCLUDING ENVIRONMENTALLY HAZARDOUS SUBSTANCES

### 2.9.1

#### DEFINITIONS

#### 2.9.1.1

Class 9 substances and articles (miscellaneous dangerous substances and articles) are substances and articles which, during transport present a danger not covered by other classes.

#### 2.9.1.2

Deleted

### 2.9.2

#### ASSIGNMENT TO CLASS 9

The substances and articles of Class 9 are subdivided as follows:

##### **Substances which, on inhalation as fine dust, may endanger health**

2212 ASBESTOS, AMPHIBOLE (amosite, tremolite, actinolite, anthophyllite, crocidolite)

2590 ASBESTOS, CHRYSOTILE

##### **Substances evolving flammable vapour**

2211 POLYMERIC BEADS, EXPANDABLE, evolving flammable vapour

3314 PLASTICS MOULDING COMPOUND in dough, sheet or extruded rope form evolving flammable vapour

##### **Lithium batteries**

3090 LITHIUM METAL BATTERIES (including lithium alloy batteries)

3091 LITHIUM METAL BATTERIES CONTAINED IN EQUIPMENT (including lithium alloy batteries) or

3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT (including lithium alloy batteries)

3480 LITHIUM ION BATTERIES (including lithium ion polymer batteries)

3481 LITHIUM ION BATTERIES CONTAINED IN EQUIPMENT (including lithium ion polymer batteries) or

3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT (including lithium ion polymer batteries)

3536 LITHIUM BATTERIES INSTALLED IN CARGO TRANSPORT UNIT

**NOTE:** See 2.9.4.

##### **Sodium ion batteries**

3551 SODIUM ION BATTERIES with organic electrolyte

3552 SODIUM ION BATTERIES CONTAINED IN EQUIPMENT or  
SODIUM ION BATTERIES PACKED WITH EQUIPMENT, with organic  
electrolyte

### **Capacitors**

3499 CAPACITOR, ELECTRIC DOUBLE LAYER (with an energy stor-  
age capacity greater than 0.3 Wh)

3508 CAPACITOR, ASYMMETRIC (with an energy storage capacity  
greater than 0.3 Wh)

### **Life-saving appliances**

2990 LIFE SAVING APPLIANCES, SELF INFLATING

3072 LIFE SAVING APPLIANCES NOT SELF INFLATING containing  
dangerous goods as equipment

3268 SAFETY DEVICES, electrically initiated.

3559 FIRE SUPPRESSANT DISPERSING DEVICES

### **Substances and articles which, in the event of fire, may form diox- ins**

This group of substances includes:

2315 POLYCHLORINATED BIPHENYLS, LIQUID

3432 POLYCHLORINATED BIPHENYLS, SOLID

3151 POLYHALOGENATED BIPHENYLS, LIQUID or

3151 HALOGENATED MONOMETHYLDIPHENYLMETHANES,  
LIQUID, or

3151 POLYHALOGENATED TERPHENYLS, LIQUID

3152 POLYHALOGENATED BIPHENYLS, SOLID or

3152 HALOGENATED MONOMETHYLDIPHENYLMETHANES,  
SOLID or

3152 POLYHALOGENATED TERPHENYLS, SOLID

Examples of articles are transformers, condensers and apparatus con-  
taining those substances.

### **Substances transported or offered for transport at elevated tem- peratures (liquid)**

3257 ELEVATED TEMPERATURE LIQUID, N.O.S., at or above  
100 °C and below its flash-point (including molten metal, molten salts,  
etc.)

### **Substances transported or offered for transport at elevated tem- peratures (solid)**

3258 ELEVATED TEMPERATURE SOLID, N.O.S., at or above 240 °C

### **Environmentally hazardous substances (solid)**

3077 ENVIRONMENTALLY HAZARDOUS SUBSTANCE, SOLID,  
N.O.S.

**Environmentally hazardous substances (liquid)**

3082 ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID,  
N.O.S.

These designations are used for substances and mixtures which are dangerous to the aquatic environment that do not meet the classification criteria of any other class or another substance within Class 9. These designations may also be used for wastes not otherwise subject to this Code but which are covered under the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal and for substances designated to be environmentally hazardous substances by the competent authority of the country of origin, transit or destination which do not meet the criteria for an environmentally hazardous substance according to this Code or for any other hazard Class. The criteria for substances which are hazardous to the aquatic environment are given in section 2.9.3.

**Genetically modified micro-organisms (GMMOs) and genetically modified organisms (GMOs)**

3245 GENETICALLY MODIFIED MICRO-ORGANISMS or

3245 GENETICALLY MODIFIED ORGANISMS

GMMOs and GMOs which do not meet the definition of toxic substances (see 2.6.2) or infectious substances (see 2.6.3) must be assigned to UN 3245.

GMMOs or GMOs are not subject to this Code when authorised for use by the competent authorities of the countries of origin, transit and destination.

Pharmaceutical products (such as vaccines) that are packed in a form ready to be administered, including those in clinical trials, and that contain GMMOs or GMOs are not subject to this Code.

Genetically modified live animals must be transported under terms and conditions of the competent authorities of the countries of origin and destination.

**Ammonium nitrate based fertilizers**

2071 AMMONIUM NITRATE BASED FERTILIZERS

Solid ammonium nitrate based fertilizers must be classified in accordance with the procedure as set out in the Manual of Tests and Criteria, part III, section 39.

**Other substances or articles presenting a danger during transport, but not meeting the definitions of another class:**

1841 ACETALDEHYDE AMMONIA

1845 CARBON DIOXIDE, SOLID (DRY ICE)

1931 ZINC DITHIONITE (ZINC HYDROSULPHITE)

1941 DIBROMODIFLUOROMETHANE

1990 BENZALDEHYDE  
 2216 FISH MEAL (FISH SCRAP), STABILISED  
 2807 MAGNETISED MATERIAL  
 2969 CASTOR BEANS or  
 2969 CASTOR MEAL or  
 2969 CASTOR POMACE or  
 2969 CASTOR FLAKE  
 3166 VEHICLE, FLAMMABLE GAS POWERED or  
 3166 VEHICLE, FLAMMABLE LIQUID POWERED or  
 3166 VEHICLE, FUEL CELL, FLAMMABLE GAS POWERED or  
 3166 VEHICLE, FUEL CELL, FLAMMABLE LIQUID POWERED  
 3171 BATTERY-POWERED VEHICLE or  
 3171 BATTERY-POWERED EQUIPMENT  
 3316 CHEMICAL KIT or  
 3316 FIRST AID KIT  
 3334 AVIATION REGULATED LIQUID, N.O.S.  
 3335 AVIATION REGULATED SOLID, N.O.S.  
 3359 FUMIGATED CARGO TRANSPORT UNIT  
 3363 DANGEROUS GOODS IN ARTICLES or  
 3363 DANGEROUS GOODS IN MACHINERY or  
 3363 DANGEROUS GOODS IN APPARATUS  
 3509 PACKAGINGS DISCARDED, EMPTY, UNCLEARED  
 3530 ENGINE, INTERNAL COMBUSTION or  
 3530 MACHINERY, INTERNAL COMBUSTION  
 3548 ARTICLES CONTAINING MISCELLANEOUS DANGEROUS  
 GOODS N.O.S.  
 3556 VEHICLE, LITHIUM ION BATTERY POWERED  
 3557 VEHICLE, LITHIUM METAL BATTERY POWERED  
 3558 VEHICLE, SODIUM ION BATTERY POWERED

#### 2.9.2.1

GMMOs or GMOs are not subject to this Code when they are:

- (a) licensed by the Office of the Gene Technology Regulator (OGTR);
- (b) approved by Food Standards Australia New Zealand (FSANZ); or
- (c) exempt from such licences and approvals under the Gene Technology Act 2000.

#### 2.9.3

### **ENVIRONMENTALLY HAZARDOUS SUBSTANCES (AQUATIC ENVIRONMENT)**

### 2.9.3.1

### General definitions

#### 2.9.3.1.1

Environmentally hazardous substances include, inter alia, liquid or solid substances pollutant to the aquatic environment and solutions and mixtures of such substances (such as preparations and wastes).

For the purposes of this section,

*Substance* means chemical elements and their compounds in the natural state or obtained by any production process, including any additive necessary to preserve the stability of the product and any impurities deriving from the process used, but excluding any solvent which may be separated without affecting the stability of the substance or changing its composition.

#### 2.9.3.1.2

The aquatic environment may be considered in terms of the aquatic organisms that live in the water, and the aquatic ecosystem of which they are part<sup>1</sup>. The basis, therefore, of the identification of hazard is the aquatic toxicity of the substance or mixture, although this may be modified by further information on the degradation and bioaccumulation behaviour.

#### 2.9.3.1.3

While the following classification procedure is intended to apply to all substances and mixtures, it is recognised that in some cases, e.g. metals or poorly soluble inorganic compounds, special guidance will be necessary<sup>2</sup>.

#### 2.9.3.1.4

The following definitions apply for acronyms or terms used in this section:

BCF: Bioconcentration Factor

BOD: Biochemical Oxygen Demand

COD: Chemical Oxygen Demand

GLP: Good Laboratory Practices

EC<sub>x</sub>: the concentration associated with x% response

EC<sub>50</sub>: the effective concentration of substance that causes 50% of the maximum response

ErC<sub>50</sub>: EC<sub>50</sub> in terms of reduction of growth

K<sub>ow</sub>: octanol/water partition coefficient

LC<sub>50</sub> (50% lethal concentration): the concentration of a substance in water which causes the death of 50% (one half) in a group of test animals

L(E)C<sub>50</sub>: LC<sub>50</sub> or EC<sub>50</sub>

NOEC: (No Observed Effect Concentration): the test concentration immediately below the lowest tested concentration with statistically sig-

---

<sup>1</sup> This does not address aquatic pollutants for which there may be a need to consider effects beyond the aquatic environment such as the impacts on human health etc.

<sup>2</sup> This can be found in Annex 10 of the GHS.

nificant adverse effect. The NOEC has not statistically significant adverse effect compared to the control

OECD Test Guidelines: Test guidelines published by the Organisation for Economic Cooperation and Development (OECD) at <[www.oecd.org/chemicalsafety/testing/oecdguidelinesforthetestingofchemicals.htm](http://www.oecd.org/chemicalsafety/testing/oecdguidelinesforthetestingofchemicals.htm)>.

#### 2.9.3.2

Definitions and data requirements

##### 2.9.3.2.1

The basic elements for classification of environmentally hazardous substances (aquatic environment) are:

- (a) acute aquatic toxicity; and
- (b) chronic aquatic toxicity; and
- (c) potential for or actual bioaccumulation; and
- (d) degradation (biotic or abiotic) for organic chemicals.

##### 2.9.3.2.2

While data from internationally harmonised test methods are preferred, in practice, data from national methods may also be used where they are considered as equivalent. In general, it has been agreed that freshwater and marine species toxicity data can be considered as equivalent data and are preferably to be derived using OECD Test Guidelines or equivalent according to the principles of Good Laboratory Practices (GLP). Where such data are not available, classification must be based on the best available data.

##### 2.9.3.2.3

Acute aquatic toxicity means the intrinsic property of a substance to be injurious to an organism in a short-term aquatic exposure to that substance.

Acute (short-term) hazard, for classification purposes, means the hazard of a chemical caused by its acute toxicity to an organism during short-term aquatic exposure to that chemical.

Acute aquatic toxicity should normally be determined using a fish 96 hour LC<sub>50</sub> (OECD Test Guideline 203 or equivalent), a crustacea species 48 hour EC<sub>50</sub> (OECD Test Guideline 202 or equivalent) and/or an algal species 72 or 96 hour EC<sub>50</sub> (OECD Test Guideline 201 or equivalent). These species are considered as surrogates for all aquatic organisms and data on other species such as Lemna may also be considered if the test methodology is suitable.

##### 2.9.3.2.4

Chronic aquatic toxicity means the intrinsic property of a substance to cause adverse effects to aquatic organisms during aquatic exposures which are determined in relation to the life-cycle of the organism.

Long-term hazard, for classification purposes, means the hazard of a chemical caused by its chronic toxicity following long-term exposure in the aquatic environment.

Chronic toxicity data are less available than acute data and the range of testing procedures less standardised. Data generated according to the OECD Test Guidelines 210 (Fish Early Life Stage) or 211 (Daphnia Reproduction) and 201 (Algal Growth Inhibition) may be accepted. Other validated and internationally accepted tests may also be used. The NOECs or other equivalent EC<sub>x</sub> must be used.

- 2.9.3.2.5 Bioaccumulation means net result of uptake, transformation and elimination of a substance in an organism due to all routes of exposure (i.e. air, water, sediment/soil and food).
- The potential for bioaccumulation should normally be determined by using the octanol/water partition coefficient, usually reported as a log Kow determined according to OECD Test Guideline 107, 117 or 123. While this represents a potential to bioaccumulate, an experimentally determined Bioconcentration Factor (BCF) provides a better measure and must be used in preference when available. A BCF must be determined according to OECD Test Guideline 305.
- 2.9.3.2.6 Degradation means the decomposition of organic molecules to smaller molecules and eventually to carbon dioxide, water and salts.
- Environmental degradation may be biotic or abiotic (e.g. hydrolysis) and the criteria used reflect this fact. Ready biodegradation is most easily defined using the biodegradability tests (A-F) of OECD Test Guideline 301. A pass level in these tests may be considered as indicative of rapid degradation in most environments. As these are fresh-water tests, use of results from OECD Test Guideline 306, which is more suitable for the marine environment, has also been included. Where such data are not available, a BOD(5 days)/COD ratio >0.5 is considered as indicative of rapid degradation. Abiotic degradation such as hydrolysis, primary degradation, both abiotic and biotic, degradation in non-aquatic media and proven rapid degradation in the environment may all be considered in defining rapid degradability<sup>1</sup>.
- Substances are considered rapidly degradable in the environment if the following criteria are met:
- (a) In 28-day ready biodegradation studies, the following levels of degradation are achieved:
    - (i) Tests based on dissolved organic carbon: 70%;
    - (ii) Tests based on oxygen depletion or carbon dioxide generation: 60% of theoretical maxima;
- These levels of biodegradation must be achieved within 10 days of the start of degradation which point is taken as the time when 10% of the substance has been degraded unless the substance is identified as a complex, multi-component substance with structurally similar constituents. In this case, and where there is sufficient justification, the 10-day window condition may be waived and the pass level applied at 28 days<sup>2</sup>; or
- (b) In those cases where only BOD and COD data are available, when the ratio of BOD5/COD is  $\geq 0.5$ ; or
  - (c) If other convincing scientific evidence is available to demonstrate that the substance or mixture can be degraded (biotically and/or abiotically) in the aquatic environment to a level above 70% within a 28 day period.

---

<sup>1</sup>Special guidance on data interpretation is provided in chapter 4.1 and Annex 9 of the GHS.

<sup>2</sup>See chapter 4.1 and Annex 9, paragraph A9.4.2.2.3 of the GHS.

### 2.9.3.3

### Substance classification categories and criteria

#### 2.9.3.3.1

Substances must be classified as "environmentally hazardous substances (aquatic environment)", if they satisfy the criteria for Acute 1, Chronic1 or Chronic 2, according to Table 2.9.1. These criteria describe in detail the classification categories. They are diagrammatically summarised in Table 2.9.2.

**Table 2.9.1: Categories for substances hazardous to the aquatic environment (see Note 1)**

**(a) Acute (short-term) aquatic hazard**

Category Acute 1: (see Note 2)

|                                                                 |                       |
|-----------------------------------------------------------------|-----------------------|
| 96 h LC <sub>50</sub> (for fish)                                | ≤ 1 mg/l and/or       |
| 48 h EC <sub>50</sub> (for crustacea)                           | ≤ 1 mg/l and/or       |
| 72 or 96h ErC <sub>50</sub> (for algae or other aquatic plants) | ≤ 1 mg/l (see Note 3) |

**(b) Long-term aquatic hazard (see also Figure 2.9.1)**

**(i) Non-rapidly degradable substances (see Note 4) for which there are adequate chronic toxicity data available**

| Category Chronic 1: (see Note 2) |                                                         |                   |
|----------------------------------|---------------------------------------------------------|-------------------|
|                                  | Chronic NOEC or ECx (for fish)                          | ≤ 0.1 mg/l and/or |

|                     | Chronic NOEC or ECx (for algae or other aquatic plants) | ≤ 0.1 mg/l        |

**(iii) Substances for which adequate chronic toxicity data are not available\*\***

|                                  |                                                                                                                                                                |                               |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| Category Chronic 1: (see Note 2) |                                                                                                                                                                |                               |
|                                  | 96 h LC <sub>50</sub> (for fish)                                                                                                                               | ≤ 1 mg/l and/or               |
|                                  | 48 h EC <sub>50</sub> (for crustacea)                                                                                                                          | ≤ 1 mg/l and/or               |
|                                  | 72 or 96 h ErC <sub>50</sub> (for algae or other aquatic plants)                                                                                               | ≤ 1 mg/l (see Note 3)         |
|                                  | and the substance is not rapidly degradable and/or the experimentally determined BCF is ≥ 500 (or, if absent the log K <sub>ow</sub> ≥ 4) (see Notes 4 and 5). |                               |
| Category Chronic 2:              |                                                                                                                                                                |                               |
|                                  | 96 h LC <sub>50</sub> (for fish)                                                                                                                               | >1 but ≤ 10 mg/l and/or       |
|                                  | 48 h EC <sub>50</sub> (for crustacea)                                                                                                                          | >1 but ≤ 10 mg/l and/or       |
|                                  | 72 or 96 h ErC <sub>50</sub> (for algae or other aquatic plants)                                                                                               | >1 but ≤ 10 mg/l (see Note 3) |
|                                  | and the substance is not rapidly degradable and/or the experimentally determined BCF is ≥ 500 (or, if absent the log K <sub>ow</sub> ≥ 4) (see Notes 4 and 5). |                               |

**Table notes:**

**NOTE 1:** The organisms fish, crustacea and algae are tested as surrogate species covering a range of trophic levels and taxa, and the test methods are highly standardised. Data on other organisms may also be considered, however, provided they represent equivalent species and test endpoints.

**NOTE 2:** When classifying substances as Acute 1 and/or Chronic 1 it is necessary at the same time to indicate an appropriate M factor (see 2.9.3.4.6.4) to apply the summation method.

**NOTE 3:** Where the algal toxicity ErC<sub>50</sub> (= EC<sub>50</sub> (growth rate)) falls more than 100 times below the next most sensitive species and results in a classification based solely on this effect, consideration must be given to whether this toxicity is representative of the toxicity to aquatic plants. Where it can be shown that this is not the case, professional judgment must be used in deciding if classification must be applied. Classification must be based on the ErC<sub>50</sub>. In circumstances where the

basis of the  $EC_{50}$  is not specified and no  $ErC_{50}$  is recorded, classification must be based on the lowest  $EC_{50}$  available.

**NOTE 4:** Lack of rapid degradability is based on either a lack of ready biodegradability or other evidence of lack of rapid degradation. When no useful data on degradability are available, either experimentally determined or estimated data, the substance must be regarded as not rapidly degradable.

**NOTE 5:** Potential to bioaccumulate, based on an experimentally derived  $BCF \geq 500$  or, if absent, a  $\log K_{ow} \geq 4$  provided  $\log K_{ow}$  is an appropriate descriptor for the bioaccumulation potential of the substance. Measured  $\log K_{ow}$  values take precedence over estimated values and measured  $BCF$  values take precedence over  $\log K_{ow}$  values.

**Figure 2.9.1: Categories for substances long-term hazardous to the aquatic environment**

#### 2.9.3.3.2

The classification scheme in Table 2.9.2 below summarises the classification criteria for substances

**Table 2.9.2: Classification scheme for substances hazardous to the aquatic environment**

| Classification categories    |                                                   |                                               |                                                                                                                           |
|------------------------------|---------------------------------------------------|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Acute hazard<br>(see Note 1) | Long-term hazard (see Note 2)                     |                                               |                                                                                                                           |

| Category: Acute 1            | Category: Chronic 1                               | Category: Chronic 1                           | Category: Chronic 1                                                                                                       |
| $L(E)C_{50} \leq 1.00$       | $NOEC \text{ or } ECx \leq 0.1$                   | $NOEC \text{ or } ECx \leq 0.01$              | $L(E)C_{50} \leq 1.00$ and lack of rapid degradability and/or $BCF \geq 500$ or,<br>if absent $\log K_{ow} \geq 4$        |
|                              | Category: Chronic 2                               | Category: Chronic 2                           | Category: Chronic 2                                                                                                       |
|                              | $0.1 < NOEC \text{ or } ECx \leq 1$               | $0.01 < NOEC \text{ or } ECx \leq 0.1$        | $1.00 < L(E)C_{50} \leq 10.0$ and lack of rapid degradability and/or $BCF \geq 500$ or,<br>if absent $\log K_{ow} \geq 4$ |

**Table notes:**

**NOTE 1:** Acute toxicity band based on  $L(E)C_{50}$  values in mg/l for fish, crustacea and/or algae or other aquatic plants (or Quantitative Structure Activity Relationships (QSAR) estimation if no experimental data <sup>1</sup>).

**NOTE 2:** Substances are classified in the various chronic categories unless there are adequate chronic toxicity data available for all three trophic levels above the water solubility or above 1 mg/l. ("Adequate" means that the data sufficiently cover the endpoint of concern. Generally this would mean measured test data, but in order to avoid unnecessary testing it can on a case by case basis also be estimated data, e.g. (Q)SAR, or for obvious cases expert judgment).

**NOTE 3:** Chronic toxicity band based on NOEC or equivalent  $ECx$  values in mg/l for fish or crustacea or other recognised measures for chronic toxicity.

## 2.9.3.4 Mixtures classification categories and criteria

### 2.9.3.4.1

The classification system for mixtures covers the classification categories which are used for substances, meaning categories Acute 1 and Chronic 1 and 2. In order to make use of all available data for purposes of classifying the aquatic environmental hazards of the mixture, the following assumption is made and is applied where appropriate:

The "relevant ingredients" of a mixture are those which are present in a concentration equal to or greater than 0.1% (by mass) for ingredients classified as Acute and/or Chronic 1 and equal to or greater than 1 % for

<sup>1</sup>Special guidance is provided in chapter 4.1, paragraph 4.1.2.13 and Annex 9, Section A9.6 of the GHS.

other ingredients, unless there is a presumption (e.g. in the case of highly toxic ingredients) that an ingredient present at less than 0.1% can still be relevant for classifying the mixture for aquatic environmental hazards.

#### 2.9.3.4.2

The approach for classification of aquatic environmental hazards is tiered, and is dependent upon the type of information available for the mixture itself and for its ingredients. Elements of the tiered approach include:

- (a) classification based on tested mixtures;
- (b) classification based on bridging principles;
- (c) the use of “summation of classified ingredients” and /or an “additivity formula”.

Figure 2.9.2 below outlines the process to be followed.

**Figure 2.9.2: Tiered approach to classification of mixtures for acute and long-term aquatic environmental hazards**

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 2.9.3.4.3   | Classification of mixtures when toxicity data are available for the complete mixture                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2.9.3.4.3.1 | When the mixture as a whole has been tested to determine its aquatic toxicity, this information must be used for classifying the mixture according to the criteria that have been agreed for substances. The classification is normally based on the data for fish, crustacea and algae/plants (see 2.9.3.2.3 and 2.9.3.2.4). When adequate acute or chronic data for the mixture as a whole are lacking, "bridging principles" or "summation method" must be applied (see 2.9.3.4.4 and 2.9.3.4.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2.9.3.4.3.2 | The long-term hazard classification of mixtures requires additional information on degradability and in certain cases bioaccumulation. There are no degradability and bioaccumulation data for mixtures as a whole. Degradability and bioaccumulation tests for mixtures are not used as they are usually difficult to interpret, and such tests may be meaningful only for single substances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 2.9.3.4.3.4 | <p>Classification for categories Chronic 1 and 2</p> <p>(a) When there are adequate chronic toxicity data (<math>EC_x</math> or <math>NOEC</math>) available for the mixture as a whole showing <math>EC_x</math> or <math>NOEC</math> of the tested mixture <math>\leq 1</math> mg/l:</p> <p>(i) classify the mixture as Chronic 1 or 2 in accordance with Table 2.9.1 (b) (ii) (rapidly degradable) if the available information allows the conclusion that all relevant ingredients of the mixture are rapidly degradable;</p> <p><b>NOTE:</b> <i>In this situation, when <math>EC_x</math> or <math>NOEC</math> of the tested mixture <math>&gt; 0.1</math> mg/l, there is no need to classify for long-term hazard under this Code.</i></p> <p>(ii) classify the mixture as Chronic 1 or 2 in all other cases in accordance with Table 2.9.1 (b) (i) (non-rapidly degradable);</p> <p>(b) When there are adequate chronic toxicity data (<math>EC_x</math> or <math>NOEC</math>) available for the mixture as a whole showing <math>EC_x(s)</math> or <math>NOEC(s)</math> of the tested mixture <math>&gt; 1</math> mg/l or above the water solubility:</p> <ul style="list-style-type: none"> <li>• no need to classify for long-term hazard under this Code.</li> </ul> |
| 2.9.3.4.4   | Classification of mixtures when toxicity data are not available for the complete mixture: bridging principles                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.9.3.4.4.1   | Where the mixture itself has not been tested to determine its aquatic environmental hazard, but there are sufficient data on the individual ingredients and similar tested mixtures to adequately characterise the hazards of the mixture, this data must be used in accordance with the following agreed bridging rules. This ensures that the classification process uses the available data to the greatest extent possible in characterising the hazards of the mixture without the necessity for additional testing in animals. |
| 2.9.3.4.4.2   | Dilution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2.9.3.4.4.2.1 | Where a new mixture is formed by diluting a tested mixture or a substance with a diluent which has an equivalent or lower aquatic hazard classification than the least toxic original ingredient and which is not expected to affect the aquatic hazards of other ingredients, then the resulting mixture must be classified as equivalent to the original tested mixture or substance. Alternatively, the method explained in 2.9.3.4.5 may be applied.                                                                             |
| 2.9.3.4.4.2.2 | If a mixture is formed by diluting another classified mixture or a substance with water or other totally non-toxic material, the toxicity of the mixture must be calculated from the original mixture or substance.                                                                                                                                                                                                                                                                                                                  |
| 2.9.3.4.4.3   | Batching                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2.9.3.4.4.3.1 | The aquatic hazard classification of a tested production batch of a mixture must be assumed to be substantially equivalent to that of another untested production batch of the same commercial product when produced by or under the control of the same manufacturer, unless there is reason to believe there is significant variation such that the aquatic hazard classification of the untested batch has changed. If the latter occurs, new classification is necessary.                                                        |
| 2.9.3.4.4.4   | Concentration of mixtures which are classified with the most severe classification categories (Chronic 1 and Acute 1)                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2.9.3.4.4.4.1 | If a tested mixture is classified as Chronic 1 and/or Acute 1, and the ingredients of the mixture which are classified as Chronic 1 and/or Acute 1 are further concentrated, the more concentrated untested mixture must be classified with the same classification category as the original tested mixture without additional testing.                                                                                                                                                                                              |
| 2.9.3.4.4.5   | Interpolation within one toxicity category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2.9.3.4.4.5.1 | For three mixtures (A, B and C) with identical ingredients, where mixtures A and B have been tested and are in the same toxicity category, and where untested mixture C has the same toxicologically active ingredients as mixtures A and B but has concentrations of toxicologically active ingredients intermediate to the concentrations in mixtures A and B, then mixture C is assumed to be in the same category as A and B.                                                                                                    |
| 2.9.3.4.4.6   | Substantially similar mixtures                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2.9.3.4.4.6.1 | Given the following: <ul style="list-style-type: none"> <li>(a) Two mixtures: <ul style="list-style-type: none"> <li>(i) A + B</li> <li>(ii) C + B</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                            |

- (b) The concentration of ingredient B is essentially the same in both mixtures;
- (c) The concentration of ingredient A in mixture (i) equals that of ingredient C in mixture (ii);
- (d) Data on aquatic hazards for A and C are available and are substantially equivalent, i.e. they are in the same hazard category and are not expected to affect the aquatic toxicity of B.

If mixture (i) or (ii) is already classified based on test data, then the other mixture can be assigned the same hazard category.

#### 2.9.3.4.5

Classification of mixtures when toxicity data are available for all ingredients or only for some ingredients of the mixture.

##### 2.9.3.4.5.1

The classification of a mixture must be based on summation of the concentrations of its classified ingredients. The percentage of ingredients classified as "Acute" or "Chronic" will feed straight into the summation method. Details of the summation method are described in 2.9.3.4.6.1 to 2.9.3.4.6.4.1.

##### 2.9.3.4.5.2

Mixtures may be made of a combination of both ingredients that are classified (as Acute 1 and/or Chronic 1, 2) and those for which adequate toxicity test data are available. When adequate toxicity data are available for more than one ingredient in the mixture, the combined toxicity of those ingredients must be calculated using the following additivity formulas (a) or (b), depending on the nature of the toxicity data:

- (a) Based on acute aquatic toxicity:

$$\frac{\sum C_i}{L(E)C_{50m}} = \sum_n \frac{C_i}{L(E)C_{50i}}$$

where:

$C_i$  = concentration of ingredient i (mass percentage);

$L(E)C_{50i}$  =  $LC_{50}$  or  $EC_{50}$  for ingredient i (mg/l);

$n$  = number of ingredients, and i is running from 1 to n;

$L(E)C_{50m}$  =  $L(E)C_{50}$  of the part of the mixture with test data

The calculated toxicity must be used to assign that portion of the mixture an acute hazard category which is then subsequently used in applying the summation method;

- (b) Based on chronic aquatic toxicity:

$$\frac{\sum C_i + \sum C_j}{EqNOEC_m} = \sum_n \frac{C_i}{NOEC_i} + \sum_n \frac{C_j}{0.1 \times NOEC_j}$$

where:

$C_i$  = concentration of ingredient i (mass percentage) covering the rapidly degradable ingredients;

$C_j$  = concentration of ingredient j (mass percentage) covering the non-rapidly degradable ingredients;

$NOEC_i$  = NOEC (or other recognised measures for chronic toxicity) for ingredient i covering the rapidly degradable ingredients, in mg/l;

$NOEC_j$  = NOEC (or other recognised measures for chronic toxicity) for ingredient j covering the non-rapidly degradable ingredients, in mg/l;

$n$  = number of ingredients, and i and j are running from 1 to n;

$EqNOEC_m$  = equivalent NOEC of the part of the mixture with test data;

The equivalent toxicity thus reflects the fact that non-rapidly degrading substances are classified one hazard category level more “severe” than rapidly degrading substances.

The calculated equivalent toxicity must be used to assign that portion of the mixture a long-term hazard category, in accordance with the criteria for rapidly degradable substances (Table 2.9.1 (b) (ii)), which is then subsequently used in applying the summation method.

#### 2.9.3.4.5.3

When applying the additivity formula for part of the mixture, it is preferable to calculate the toxicity of this part of the mixture using for each ingredient toxicity values that relate to the same taxonomic group (i.e. fish, crustacea or algae) and then to use the highest toxicity (lowest value) obtained (i.e. use the most sensitive of the three groups). However, when toxicity data for each ingredient are not available in the same taxonomic group, the toxicity value of each ingredient must be selected in the same manner that toxicity values are selected for the classification of substances, i.e. the higher toxicity (from the most sensitive test organism) is used. The calculated acute chronic toxicity must then be used to classify this part of the mixture as Acute 1 and/or Chronic 1 or 2 using the same criteria described for substances.

#### 2.9.3.4.5.4

If a mixture is classified in more than one way, the method yielding the more conservative result must be used.

#### 2.9.3.4.6

Summation method

#### 2.9.3.4.6.1

Classification procedure

#### 2.9.3.4.6.1.1

In general a more severe classification for mixtures overrides a less severe classification, e.g. a classification with Chronic 1 overrides a classification with Chronic 2. As a consequence the classification procedure is already completed if the results of the classification is Chronic 1. A more severe classification than Chronic 1 is not possible; therefore, it is not necessary to pursue the classification procedure further.

#### 2.9.3.4.6.2

Classification for category Acute 1

#### 2.9.3.4.6.2.1

First, all ingredients classified as Acute 1 are considered. If the sum of the concentrations (in %) of these ingredients is greater than or equal to 25% the whole mixture must be classified as Acute 1. If the result of the calculation is a classification of the mixture as Acute 1, the classification process is completed.

2.9.3.4.6.2.2 The classification of mixtures for acute hazards based on this summation of the concentrations of classified ingredients is summarised in Table 2.9.3 below.

**Table 2.9.3: Classification of a mixture for acute hazards based on summation of the concentrations of classified ingredients**

| Sum of the concentrations (in %) of ingredients classified as:                | Mixture classified as: |
|-------------------------------------------------------------------------------|------------------------|
| Acute 1 x M <sup>a</sup> ≥ 25%                                                | Acute 1                |
| Table note:<br><sup>a</sup> For explanation of the M factor, see 2.9.3.4.6.4. |                        |

2.9.3.4.6.3 Classification for categories Chronic 1 and 2

2.9.3.4.6.3.1 First, all ingredients classified as Chronic 1 are considered. If the sum of the concentrations (in %) of these ingredients is greater than or equal to 25% the mixture must be classified as Chronic 1. If the result of the calculation is a classification of the mixture as Chronic 1 the classification procedure is completed.

2.9.3.4.6.3.2 In cases where the mixture is not classified as Chronic 1, classification of the mixture as Chronic 2 is considered. A mixture must be classified as Chronic 2 if 10 times the sum of the concentrations (in %) of all ingredients classified as Chronic 1 plus the sum of the concentrations (in %) of all ingredients classified as Chronic 2 is greater than or equal to 25%. If the result of the calculation is classification of the mixture as Chronic 2, the classification process is completed.

2.9.3.4.6.3.3 The classification of mixtures for long-term hazards based on this summation of the concentrations of classified ingredients is summarised in Table 2.9.4 below.

**Table 2.9.4: Classification of a mixture for long-term hazards based on summation of the concentrations of classified ingredients**

| Sum of the concentrations (in %) of ingredients classified as:               | Mixture classified as: |
|------------------------------------------------------------------------------|------------------------|
| Chronic 1 x M <sup>a</sup> ≥ 25%                                             | Chronic 1              |
| (M x 10 x Chronic 1)+Chronic 2 ≥ 25%                                         | Chronic 2              |
| Table note:<br><sup>a</sup> For explanation of the M factor, see 2.9.3.4.6.4 |                        |

2.9.3.4.6.4 Mixtures with highly toxic ingredients

2.9.3.4.6.4.1 Acute 1 or Chronic 1 ingredients with acute toxicities well below 1 mg/L and/or chronic toxicities well below 0.1 mg/L (if non-rapidly degradable) and 0.01 mg/L (if rapidly degradable) may influence the toxicity of the mixture and are given increased weight in applying the summation method. When a mixture contains ingredients classified as Acute 1 or Chronic 1, the tiered approach described in 2.9.3.4.6.2 and 2.9.3.4.6.3

must be applied using a weighted sum by multiplying the concentrations of Acute 1 and Chronic 1 ingredients by a factor, instead of merely adding up the percentages.

This means that the concentration of “Acute 1” in the left column of Table 2.9.3 and the concentration of “Chronic 1” in the left column of Table 2.9.4 are multiplied by the appropriate multiplying factor. The multiplying factors to be applied to these ingredients are defined using the toxicity value, as summarised in Table 2.9.5 below. Therefore, in order to classify a mixture containing Acute 1 and/or Chronic 1 ingredients, the classifier needs to be informed of the value of the M factor in order to apply the summation method.

Alternatively, the additivity formula (2.9.3.4.5.2) may be used when toxicity data are available for all highly toxic ingredients in the mixture and there is convincing evidence that all other ingredients, including those for which specific acute and/or chronic toxicity data are not available, are of low or no toxicity and do not significantly contribute to the environmental hazard of the mixture.

**Table 2.9.5: Multiplying factors for highly toxic ingredients of mixtures**

| Acute toxicity                    | M factor | Chronic toxicity                  | M factor                     |                             |
|-----------------------------------|----------|-----------------------------------|------------------------------|-----------------------------|
| L(E)C50 value                     |          | NOEC value                        | NRD <sup>a</sup> ingredients | RD <sup>b</sup> ingredients |
| $0.1 < L(E)C50 \leq 1$            | 1        | $0.01 < NOEC \leq 0.1$            | 1                            | -                           |
| $0.01 < L(E)C50 \leq 0.1$         | 10       | $0.001 < NOEC \leq 0.01$          | 10                           | 1                           |
| $0.001 < L(E)C50 \leq 0.01$       | 100      | $0.0001 < NOEC \leq 0.001$        | 100                          | 10                          |
| $0.0001 < L(E)C50 \leq 0.001$     | 1 000    | $0.00001 < NOEC \leq 0.0001$      | 1 000                        | 100                         |
| $0.00001 < L(E)C50 \leq 0.0001$   | 10 000   | $0.000001 < NOEC \leq 0.00001$    | 10 000                       | 1 000                       |
| (continue in factor 10 intervals) |          | (Continue in factor 10 intervals) |                              |                             |

<sup>a</sup> Non-rapidly degradable.

<sup>b</sup> Rapidly degradable.

2.9.3.4.6.5 Classification of mixtures with ingredients without any useable information

2.9.3.4.6.5.1 In the event that no useable information on acute and/or chronic aquatic toxicity is available for one or more relevant ingredients, it is concluded that the mixture cannot be attributed (a) definitive hazard category(ies). In this situation the mixture must be classified based on the known ingredients only.

## 2.9.4 LITHIUM BATTERIES

Cells and batteries, cells and batteries contained in equipment, or cells and batteries packed with equipment, containing lithium in any form must be assigned to UN Nos. 3090, 3091, 3480 or 3481 as appropriate.

They may be transported under these entries if they meet the following provisions:

- (a) Each cell or battery is of the type proved to meet the requirements of each test of the Manual of Tests and Criteria, Part III, sub-section 38.3; Cells and batteries manufactured according to a type meeting the requirements of sub-section 38.3 of the Manual of Tests and Criteria, Revision 3, Amendment 1 or any subsequent revision and amendment applicable at the date of the type testing may continue to be transported, unless otherwise provided in this Code. Cell and battery types only meeting the requirements of the Manual of Tests and Criteria, Revision 3, are no longer valid. However, cells and batteries manufactured in conformity with such types before 1 July 2003 may continue to be transported if all other applicable requirements are fulfilled.

**NOTE:** *Batteries are to be of a type proved to meet the testing requirements of the Manual of Tests and Criteria, part III, sub-section 38.3, irrespective of whether the cells of which they are composed are of a tested type.*

- (b) Each cell and battery incorporates a safety venting device or is designed to preclude a violent rupture under conditions normally incident to transport;
- (c) Each cell and battery is equipped with an effective means of preventing external short circuits;
- (d) Each battery containing cells or series of cells connected in parallel is equipped with effective means as necessary to prevent dangerous reverse current flow (e.g., diodes, fuses, etc.);
- (e) Cells and batteries must be manufactured under a quality management programme that includes:
  - (i) A description of the organisational structure and responsibilities of personnel with regard to design and product quality;
  - (ii) The relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
  - (iii) Process controls that should include relevant activities to prevent and detect internal short circuit failure during manufacture of cells;
  - (iv) Quality records, such as inspection reports, test data, calibration data and certificates. Test data must be kept and made available to the competent authority upon request;
  - (v) Management reviews to ensure the effective operation of the quality management programme;
  - (vi) A process for control of documents and their revision;
  - (vii) A means for control of cells or batteries that are not conforming to the type tested as mentioned in (a) above;
  - (viii) Training programmes and qualification procedures for relevant personnel; and
  - (ix) ) Procedures to ensure that there is no damage to the final product.

**NOTE:** *In house quality management programmes may be accepted. Third party certification is not required, but the procedures*

*listed in (i) to (ix) above must be properly recorded and traceable. A copy of the quality management programme must be made available to the competent authority upon request.*

- (f) Lithium batteries, containing both primary lithium metal cells and rechargeable lithium ion cells, that are not designed to be externally charged (see special provision 387 of chapter 3.3) shall meet the following conditions:
  - (i) The rechargeable lithium ion cells can only be charged from the primary lithium metal cells;
  - (ii) Overcharge of the rechargeable lithium ion cells is precluded by design;
  - (iii) The battery has been tested as a lithium primary battery;
  - (iv) Component cells of the battery shall be of a type proved to meet the respective testing requirements of the Manual of Tests and Criteria, part III, sub-section 38.3.
- (g) Except for button cells installed in equipment (including circuit boards), manufacturers and subsequent distributors of cells or batteries manufactured after 30 June 2003 shall make available the test summary as specified in the Manual of Tests and Criteria, Part III, sub-section 38.3, paragraph 38.3.5

NOTE: The term "make available" means that manufacturers and subsequent distributors ensure that the test summary for lithium cells or batteries or equipment with installed lithium cells or batteries is accessible so that the consignor or other persons in the supply chain can confirm compliance.

## 2.9.5

### SODIUM ION BATTERIES

Cells and batteries, cells and batteries contained in equipment, or cells and batteries packed with equipment, containing sodium ion, which are a rechargeable electrochemical system where the positive and negative electrode are both intercalation or insertion compounds, constructed with no metallic sodium (or sodium alloy) in either electrode and with an organic non aqueous compound as electrolyte, shall be assigned to UN Nos. 3551 or 3552 as appropriate.

**NOTE:** *Intercalated sodium exists in an ionic or quasi-atomic form in the lattice of the electrode material.*

*They may be transported under these entries if they meet the following provisions:*

- (a) Each cell or battery is of the type proved to meet the requirements of applicable tests of the Manual of Tests and Criteria, part III, sub-section 38.3.
- (b) Each cell and battery incorporates a safety venting device or is designed to preclude a violent rupture under conditions normally encountered during transport.
- (c) Each cell and battery is equipped with an effective means of preventing external short circuits;

- (d) Each battery containing cells or a series of cells connected in parallel is equipped with effective means as necessary to prevent dangerous reverse current flow (e.g. diodes, fuses, etc.);
- (e) Cells and batteries shall be manufactured under a quality management program as prescribed under 2.9.4 (e) (i) to (ix);
- (f) Manufacturers and subsequent distributors of cells or batteries shall make available the test summary as specified in the Manual of Tests and Criteria, part III, sub-section 38.3, paragraph 38.3.5.

# **PART 3**

## **DANGEROUS GOODS LISTS, SPECIAL PROVISIONS AND EXCEPTIONS**

## CHAPTER 3.1: GENERAL

### 3.1.1 SCOPE AND GENERAL PROVISIONS

3.1.1.1 The Dangerous Goods List in this chapter lists the dangerous goods most commonly carried but is not exhaustive<sup>1</sup>3.1.1.1 . It is intended that the list cover, as far as practicable, all dangerous substances of commercial importance.

3.1.1.2 Where a substance or article is specifically listed by name in the Dangerous Goods List, it must be transported in accordance with the provisions in the List which are appropriate for that substance or article. A “generic” or “not otherwise specified” entry may be used to permit the transport of substances or articles which do not appear specifically by name in the Dangerous Goods List. Such a substance or article may be transported only after its dangerous properties have been determined. The substance or article must then be classified according to the Class definitions and test criteria and the name in the Dangerous Goods List which most appropriately describes the substance or article must be used. The classification may be made by the appropriate competent authority when so required or may otherwise be made by the consignor. Once the Class of the substance or article has been so established, all conditions for dispatch and transport, as provided in this Code must be met. Any substance or article having or suspected of having explosive characteristics must first be considered for inclusion in Class 1. Some collective entries may be of the “generic” or “not otherwise specified” type provided that this Code contains provisions ensuring safety, both by excluding extremely dangerous goods from normal transport and by covering all subsidiary hazards inherent in some goods.

---

<sup>1</sup>The Dangerous Goods List is non-exhaustive to the extent that not all substances that meet the criteria of Part 2 for classification as dangerous goods are individually listed by chemical name. However, all such substances that are not listed individually are included in the list under “generic” or “not otherwise specified” names covering the full spectrum of hazardous properties for which criteria have been specified. (For further details, see Sections 2.0.2, 3.1.2 and 3.1.3).

- 3.1.1.3 The Dangerous Goods List does not include goods which are so dangerous that their transport, except with special authorisation, is prohibited. Appendix A lists some goods the transport of which by road and rail in Australia is prohibited without a specific exemption or determination from the Competent Authority. It must be recognised that the list in Appendix A is not exhaustive, as it would be impossible to draw up an exhaustive list. Moreover, the list in Appendix A will, over time, become less exhaustive because of the frequent introduction of new substances. Therefore the absence of a substance from Appendix A must not be interpreted that that substance may be carried without special restrictions. Inherent instability in goods may take different dangerous forms, for example, explosion, polymerisation, with intense evolution of heat, or emission of toxic gases. In respect of most substances, such tendencies can be controlled by correct packing, dilution, stabilisation, addition of an inhibitor, refrigeration or other precautions.
- 3.1.1.4 Where precautionary measures are laid down in the Dangerous Goods List in respect of a given substance or article (e.g. that it must be “stabilised” or “with x% water or phlegmatiser”) such substance or article may not normally be carried when these measures have not been taken, unless the item in question is listed elsewhere (e.g. Class 1) without any indication of, or with different, precautionary measures.
- 3.1.2 PROPER SHIPPING NAME**
- NOTE 1:** *For proper shipping names used for the transport of samples, see 2.0.4.*
- NOTE 2:** *For proper shipping names of dangerous goods of Class 1, 6.2 or 7, reference must also be made to the legislation applying in the State or Territory in which the goods are transported.*
- 3.1.2.1 The proper shipping name is that portion of the entry most accurately describing the goods in the Dangerous Goods List in 3.2.3, or the Australian Specific Entries in 3.2.5, which is shown in upper case characters (plus any numbers, Greek letters, “sec”, “tert”, and the letters m, n, o, p, which form an integral part of the name). An alternative proper shipping name may be shown in brackets following the main proper shipping name [e.g., ETHANOL (ETHYL ALCOHOL)]. Portions of an entry appearing in lower case need not be considered as part of the proper shipping name but may be used.
- 3.1.2.2 When a combination of several distinct proper shipping names are listed under a single UN number, and these are separated by “or” in lower case or are punctuated by commas, only the most appropriate shall be shown in the transport document and package marks. Examples illustrating the selection of the proper shipping name for such entries are:
- (a) UN 1057 LIGHTERS or LIGHTER REFILLS – The proper shipping name is the most appropriate of the following possible combinations:
- LIGHTERS;
- LIGHTER REFILLS;

- (b) UN 2793 FERROUS METAL BORINGS, SHAVINGS, TURNINGS or CUTTINGS in a form liable to self-heating - The proper shipping name is the most appropriate of the following combinations:

FERROUS METAL BORINGS

FERROUS METAL SHAVINGS

FERROUS METAL TURNINGS

FERROUS METAL CUTTINGS

3.1.2.3

Proper shipping names may be used in the singular or plural as appropriate. In addition, when qualifying words are used as part of the proper shipping name, their sequence on documentation or package marks is optional.

For instance, "DIMETHYLAMINE AQUEOUS SOLUTION" may alternatively be shown "AQUEOUS SOLUTION OF DIMETHYLAMINE". Commercial or military names for goods of Class 1 which contain the proper shipping name supplemented by additional descriptive text may be used.

3.1.2.4

Many substances have an entry for both the liquid and solid state (see definitions for liquid and solid in 1.2.1), or for the solid and solution. These are allocated separate UN numbers which are not necessarily adjacent to each other. Details are provided in the alphabetical index, e.g.:

NITROXYLENES, LIQUID 6.1 1665

NITROXYLENES, SOLID 6.1 3447

3.1.2.5

Unless it is already included in capital letters in the name indicated in the Dangerous Goods List, the qualifying word "MOLTEN" must be added as part of the proper shipping name when a substance, which is a solid in accordance with the definition in 1.2.1, is offered for transport in the molten state (e.g. ALKYLPHENOL, SOLID, N.O.S., MOLTEN).

3.1.2.6

Except for self-reactive substances and organic peroxides and unless it is already included in capital letters in the name indicated in the Dangerous Goods List, the word STABILISED must be added as part of the proper shipping name of a substance which, without stabilisation, would be forbidden from transport in accordance with 1.1.2 due to it being liable to dangerously react under conditions normally encountered in transport (e.g.: "TOXIC LIQUID, ORGANIC, N.O.S., STABILISED").

When temperature control is used to stabilise such substances to prevent the development of any dangerous excess pressure, or the evolution of excessive heat, or when chemical stabilization is used in combination with temperature control then:

- (a) for liquids and solids: where the SAPT (measured without or with inhibitor, when chemical stabilization is applied) is less than or equal to that prescribed in 2.4.2.5.2, special provision 386 of chapter 3.3 and the provisions of 7.1.5 apply
- (b) Unless it is already included in capital letters in the name indicated in the Dangerous Goods List, the words "TEMPERATURE CONTROLLED" shall be added as part of the proper shipping name.

(c) for gases: transport is not permitted except in accordance with a competent authority exemption.

3.1.2.7 Hydrates may be transported under the proper shipping name for the anhydrous substance.

### 3.1.2.8 Generic or “not otherwise specified” (N.O.S.) names

3.1.2.8.1 Generic and “not otherwise specified” proper shipping names that are assigned to special provision 274 or 318 in Column 6 of the Dangerous Goods List must be supplemented with the technical or chemical group names unless a national law or international convention prohibits its disclosure if it is a controlled substance. For explosives of Class 1, the dangerous goods description may be supplemented by additional descriptive text to indicate commercial or military names. Technical and chemical group names must be entered in brackets immediately following the proper shipping name. An appropriate modifier, such as “contains” or “containing” or other qualifying words such as “mixture”, “solution”, etc. and the percentage of the technical constituent may also be used. For example: “UN 1993 FLAMMABLE LIQUID, N.O.S. (contains xylene and benzene), 3, PG II”.

3.1.2.8.1.1 The technical name must be a recognised chemical or biological name, or other name currently used in scientific and technical handbooks, journals and texts. Trade names must not be used for this purpose. In the case of pesticides, only ISO common name(s), other name(s) in the World Health Organisation (WHO) Recommended Classification of Pesticides by Hazard and Guidelines to Classification, or the name(s) of the active substance(s) may be used.

3.1.2.8.1.2 When a mixture of dangerous goods or articles containing dangerous goods are described by one of the “N.O.S.” or “generic” entries to which special provision 274 has been allocated in the Dangerous Goods List, not more than the two constituents which most predominantly contribute to the hazard or hazards of the mixture or of the articles need to be shown, excluding controlled substances when their disclosure is prohibited by national law or international convention. If a package containing a mixture is labelled with any subsidiary hazard label, one of the two technical names shown in brackets must be the name of the constituent which compels the use of the subsidiary hazard label.

3.1.2.8.1.3 Examples illustrating the selection of the proper shipping name supplemented with the technical name of goods for such N.O.S. entries are:

|         |                                                                                 |
|---------|---------------------------------------------------------------------------------|
| UN 2902 | PESTICIDE, LIQUID, TOXIC, N.O.S. (drazoxolon).                                  |
| UN 3394 | ORGANOMETALLIC SUBSTANCE, LIQUID, PYROPHORIC, WATER-REACTIVE (trimethylgallium) |
| UN 3540 | ARTICLES CONTAINING FLAMMABLE LIQUIDS N.O.S. (pyrrolidine)                      |

3.1.2.9 Spelling of Sulfur (Sulphur)

In this Code, in line with the usage in UN23, Sulfur compounds are spelt with “ph” in lieu of “f” used in earlier editions. Either spelling is acceptable in the proper shipping name on transport documentation, package marking and placards required by this Code.

### 3.1.3

### MIXTURES OR SOLUTIONS

**NOTE:** *Where a substance is specifically listed by name in the Dangerous Goods List, it must be identified in transport by the proper shipping name in the Dangerous Goods List. Such substances may contain technical impurities (for example those deriving from the production process) or additives for stability or other purposes that do not affect its classification. However, a substance listed by name containing technical impurities or additives for stability or other purposes affecting its classification must be considered a mixture or solution (see 2.0.2.2 and 2.0.2.5).*

#### 3.1.3.1

A mixture or solution is not subject to this Code if the characteristics, properties, form or physical state of the mixture or solution are such that it does not meet the criteria, including human experience criteria, for inclusion in any class.

#### 3.1.3.2

A mixture or solution meeting the classification criteria of this Code composed of a single predominant substance identified by name in the Dangerous Goods List and one or more substances not subject to this Code and/or traces of one or more substances identified by name in the Dangerous Goods List, must be assigned the UN number and proper shipping name of the predominant substance named in the Dangerous Goods List unless:

- (a) The mixture or solution is identified by name in the Dangerous Goods List;
- (b) The name and description of the substance named in the Dangerous Goods List specifically indicate that they apply only to the pure substance;
- (c) The hazard class or division, subsidiary hazard(s), packing group, or physical state of the mixture or solution is different from that of the substance named in the Dangerous Goods List; or
- (d) The hazard characteristics and properties of the mixture or solution necessitate emergency response measures that are different from those required for the substance identified by name in the Dangerous Goods List.

#### 3.1.3.2.1

Qualifying words such as "MIXTURE" or "SOLUTION", as appropriate, must be added as part of the proper shipping name, for example, "ACETONE SOLUTION". In addition, the concentration of the mixture or solution may also be indicated after the basic description of the mixture or solution, for example, "ACETONE 75% SOLUTION".

#### 3.1.3.3

A mixture or solution meeting the classification criteria of this Code that is not identified by name in the Dangerous Goods List and that is composed of two or more dangerous goods must be assigned to an entry that has the proper shipping name, description, hazard class or division, subsidiary hazard(s) and packing group that most precisely describe the mixture or solution.

## CHAPTER 3.2: DANGEROUS GOODS LIST

### 3.2.0

#### INTRODUCTION

**NOTE 1:** *The List includes dangerous goods of Class 1 (Explosive substances or articles) and Class 7 (Radioactive material), even though this Code does not contain substantive provisions in relation to either of those Classes, other than in an incidental way. These items have been included in the List for information purposes only.*

**NOTE 2:** *The List also includes goods that are only dangerous goods when transported by sea or air.*

### 3.2.0.1

#### The Dangerous Goods List

Section 3.2.3 embodies the definitive Dangerous Goods List from UN23. This list includes all classification details and provides references to special provisions, packing and tank requirements as explained in 3.2.1.

### 3.2.0.2

#### Other Listings of Dangerous Goods

This chapter also incorporates the following additional lists of dangerous goods:

- (a) Section 3.2.4 which is an alphabetical listing incorporating the Alphabetical Index of Substances and Articles from UN23. This Index lists the Class or Division and the UN Number for each proper shipping name that is included in the Dangerous Goods List. Some commonly used synonyms are also included in lower case, providing a reference to the proper shipping name that must be used;
- (b) Section 3.2.5 which lists some alternative proper shipping names that are valid for land transport within Australia only; and
- (c) Section 3.2.6, which reproduces the List of Generic and N.O.S. Proper Shipping Names from Appendix A of UN14/15 as updated by later editions up to UN23.

### 3.2.1

#### STRUCTURE OF THE DANGEROUS GOODS LIST

The Dangerous Goods List is divided into 11 columns as follows:

|          |                                                                                                                                                                                                                                                                                                                                                                                           |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Column 1 | <b>“UN No.”</b> - this column contains the serial number assigned to the article or substance under the United Nations system.                                                                                                                                                                                                                                                            |
| Column 2 | <b>“Name and Description”</b> - this column contains the proper shipping names in uppercase characters, which may be followed by additional descriptive text presented in lowercase characters (see 3.1.2). In relation to Explosives, an explanation of some of the terms used appears in the Australian Explosives Code. Proper shipping names may be shown in the plural where isomers |

of similar classification exist. Hydrates may be included under the proper shipping name for the anhydrous substance, as appropriate.

Unless otherwise indicated for an entry in the Dangerous Goods List, the word “solution” in a proper shipping name means one or more named dangerous goods dissolved in a liquid that is not otherwise subject to this Code.

|           |                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Column 3  | <b>“Class or Division”</b> - this column contains the Class or Division and in the case of Class 1, the compatibility group assigned to the article or substance according to the classification system described in chapter 2.1.                                                                                                                                                  |
| Column 4  | <b>“Subsidiary Hazard”</b> - this column contains the Class or Division number of any important subsidiary hazards which have been identified by applying the classification system described in Part 2.                                                                                                                                                                           |
| Column 5  | <b>“UN Packing Group”</b> - this column contains the UN packing group number (i.e. I, II or III) assigned to the substance. If more than one packing group is indicated for the entry, the packing group of the substance or formulation to be transported must be determined, based on its properties, through application of the hazard grouping criteria as provided in Part 2. |
| Column 6  | <b>“Special Provisions”</b> - this column contains a number referring to any special provision(s) indicated in 3.3.1 that are relevant to the article or substance. Special provisions apply to all the packing groups permitted for a particular substance or article unless the wording makes it otherwise apparent.                                                             |
| Column 7a | <b>“Limited Quantities”</b> - this column provides the maximum quantity per inner packaging or article for transporting dangerous goods as limited quantities in accordance with chapter 3.4.                                                                                                                                                                                      |
| Column 7b | <b>“Excepted Quantities”</b> - this column provides an alphanumeric code described in sub-section 3.5.1.2 which indicates the maximum quantity per inner and outer packaging for transporting dangerous goods as excepted quantities in accordance with chapter 3.5.                                                                                                               |
| Column 8  | <b>“Packing Instruction”</b> - This column contains alphanumeric codes which refer to the relevant packing instructions specified in section 4.1.4. The packing instructions indicate the packaging (including IBCs and large packaging’s), which may be used for the transport of substances and articles.                                                                        |

A code including the letter “P” refers to packing instructions for the use of packaging’s described in Chapters

6.1, 6.2 or 6.3.

A code including the letters “IBC” refers to packing instructions for the use of IBCs described in chapter 6.5.

A code including the letters “LP” refers to packing instructions for the use of large packaging’s described in chapter 6.6.

When a particular code is not provided, it means the substance is not authorised in the type of packaging that may be used according to the packing instructions bearing that code.

When N/A is included in the column it means that the substance or article need not be packaged.

The packing instructions are listed in numerical order in section 4.1.4 as follows:

Sub-section 4.1.4.1: Packing instructions concerning the use of packaging’s (except IBCs and large packaging’s) (P);

Sub-section 4.1.4.2: Packing instructions concerning the use of IBCs (IBC);

Sub-section 4.1.4.3: Packing instructions concerning the use of large packagings (LP).

Column 9

**“Special Packing Provisions”** - this column contains alpha numeric codes which refer to the relevant special packing provisions specified in section 4.1.4. The special packing provisions indicate the special provisions for packaging (including IBCs and large packagings).

A special packing provision including the letters “PP” refers to special packing provision applicable to the use of packing instructions bearing the code “P” in 4.1.4.1.

A special packing provision including the letter “B” refers to special packing provision applicable to the use of packing instructions bearing the code “IBC” in 4.1.4.2.

A special provision including the letter “L” refers to special packing provision applicable to packing instructions bearing the code “LP” in 4.1.4.3.

Column 10

**“Portable Tank and Bulk Containers / Instructions”** - this column contains a number preceded by the letter “T” which refers to the relevant instruction in 4.2.5 specifying the tank type(s) required for the transport of the substance in portable tanks. A “T” entry in Column 10 is also an indication that the substance may be transported in a suitable tank vehicle in accordance with Section 4.4.2.

A code including the letters “BK” refers to types of bulk

containers used for the transport of bulk goods described in chapter 6.8.

The gases authorised for transport in MEGCs are indicated in the column “MEGC” in Tables 1 and 2 of packing instruction P200 in 4.1.4.1.

Column 11

**“Portable Tank and Bulk Containers / Special Provisions”** - this column contains a number preceded by the letters “TP” referring to any special provisions indicated in 4.2.5.3 that apply to the transport of the substance in portable tanks.

3.2.2

**ABBREVIATIONS AND SYMBOLS**

The following abbreviations or symbols are used in the Dangerous Goods List and have the meanings shown:

| Abbreviation | Column | Meaning                                                                                                        |
|--------------|--------|----------------------------------------------------------------------------------------------------------------|
| N.O.S.       | 2      | Not otherwise specified.                                                                                       |
| †            | 2      | Entry for which there is an explanation in Appendix B of UN23 or Appendix 5 of the Australian Explosives Code. |

3.2.3

**DANGEROUS GOODS LIST**

Table 3.2.3: Dangerous Goods List

| UN No. | Name and Description                                                                                     | Class or | Subsidiary | UN Packing | Special    | Limited and excepted |      | Packaging                     |                            |
